Subject: Triennial Chlorine Survey Report

Enclosed is the Exelon Generation Company, LLC, LaSalle County Station (LSCS) Triennial Chlorine Survey Report. The survey is submitted in accordance with the provisions of the April 11, 1986, letter transmitting Amendments 38 and 20 to the LSCS Facility Operating Licenses for Units 1 and 2, respectively.

This letter contains no new regulatory commitments. Should you have any questions concerning this letter, please contact Mr. Daniel Mearhoff, Regulatory Assurance Manager, at (815) 415-2800.

Respectfully,

John J. Washko
Site Vice President
LaSalle County Station

Enclosure: Chlorine Survey in the Vicinity of LaSalle County Generating Station

cc: Regional Administrator - NRC Region III
NRC Senior Resident Inspector - LaSalle County Station

ADD1
NR

CHLORINE SURVEY IN THE VICINITY OF LASALLE COUNTY GENERATING STATION

1. Executive Summary

A triennial survey of potential sources of chlorine was conducted by LaSalle County Station to ensure compliance with General Design Criteria (GDC) 19 of Appendix A of 10 CFR 50. The survey reevaluates use of chlorine within 5 miles of the plant's Control Room and ensures that a chlorine hazard does not exist. The survey also ensures compliance with Regulatory Guides (RG) 1.78, Revision 0, "Assumptions for Evaluating the Habitability of a Nuclear Power Plant Control Room During a Postulated Hazardous Chemical Release," and RG 1.95, Revision 0, "Protection of Nuclear Power Plant Control Room Operators Against an Accidental Chlorine Release".

A database of potential chlorine sources was built based on facilities identified in previous surveys and updated with information from the Grundy and LaSalle County Emergency Services and Disaster Agencies (ESDA). The database was limited to facilities located between the Marseilles and Dresden Island Locks and included facilities within and outside the five-mile radius of LaSalle County Station. A total of fifteen facilities in Grundy and LaSalle Counties fit the criteria and were included in this survey, of which fourteen responded.

Data from five controlling authorities and fourteen facilities was reviewed and follow-up contacts were made to confirm the information gathered. The survey identified five facilities used and stored chlorine onsite. The results of this survey indicate chlorine is used and stored in cylinders that are not larger than 150 lbs. at facilities within five miles of LaSalle Station. Also, no chlorine is transported on the Illinois River.

2. Introduction

Licensing of LaSalle County Station required a survey of industries and transportation routes in the site vicinity that may use, store, and/or transport hazardous chemicals. The original survey, conducted in 1975, revealed anhydrous ammonia and probably chlorine were transported by barge on the Illinois River. The information gathered was not complete enough to conclude that chlorine was not shipped in large quantities by barge on the Illinois River.

A new survey was conducted in January – February 1986 to supplement the information obtained from the 1975 chlorine survey. The information collected by the 1986 survey concluded no special chlorine protection provisions were required at LaSalle County Station. In the safety evaluation supporting Amendment No. 38 to Facility Operating License No. NPF-11 and Amendment No. 20 to Facility Operating License No. NPF-18, the U.S. Nuclear Regulatory Commission (NRC) agreed with this conclusion, but recommended a three-year update for the Illinois River chlorine survey. Exelon Corporation committed to the survey update in a letter to the NRC dated March 5, 1986. Surveys have been conducted on a 3-year frequency supporting the conclusion that chlorine is not shipped on the Illinois River in sufficient quantities to present a hazard to the LaSalle County Station Control Room. In accordance with this commitment, a new survey has been conducted.

The following sections describe regulatory guides that form the basis of the Control Room habitability evaluation, results of previous surveys, the methods and results of current survey, and the conclusion regarding chlorine as a hazard. The results of the current survey and previous surveys fully support the 1986 conclusion that no special chlorine protection measures are required at LaSalle County Station.

3. Regulatory Guides

Regulatory Guide 1.78, Revision 0, "Assumption for Evaluating the Habitability of a Nuclear Power Plant Control Room during a Postulated Hazardous Chemical Release" identifies chlorine as a hazardous chemical that requires a control room habitability analysis in the event of an accidental chlorine release from stationary or mobile sources near the station. Regulatory Guide 1.95, Revision 0, specifically addresses onsite accidental chlorine release. However, it can also be used in analyzing effects of an offsite chlorine release.

Regulatory Position 1 of Regulatory Guide 1.78, states chlorine stored or situated at greater distances than five miles from the control room need not be considered in evaluating habitability of the nuclear power plant control room during a postulated chlorine release. Regulatory Guide 1.78 also specifies frequency, distance, and quantity of chemicals transported or stored with respect to the Control Room that require Control Room habitability analysis. The Regulatory Guide specifies three modes of transportation that must be considered for chlorine manufactured, stored or used by industries in the vicinity of the control room: railroads, highways, and waterways.

4. Earlier Surveys of Chlorine Shipment

The LaSalle County Final Safety Analysis Report (FSAR) Section 2.1.1 describes the location of the plant and transportation routes near the plant. FSAR Section 2.2.2 describes nearby industrial, transportation, and military facilities. All industrial facilities are located outside of a five-mile radius of the plant, therefore, chlorine used or stored at these facilities need not be considered in evaluating control room habitability. A survey of these industries was conducted in 1975 to determine the shipment of chlorine by three

modes of transportation, U.S. Highway 6 and State Highway 47, the nearest highways to the station used by these industries and the Chicago Rock Island and Pacific, the nearest railroad, are all located farther than five miles from the station. Therefore, transportation of chlorine by these two modes of transportation need not be considered in the control room habitability analysis.

FSAR Section 2.2.2.4 describes river traffic on the Illinois River passing the site. Section 2.2.3.1.c concluded the only transportation route potentially carrying chlorine within five miles of the station was the Illinois River, which is located approximately 4.7 miles north of the station. However, the available data on commodities transported on the Illinois River (FSAR Table 2.204) did not differentiate barge shipments of chlorine from other chemicals. The survey found a small quantity of chlorine was used by the Illinois Nitrogen Corporation, located at river mile 248.7, approximately five miles north of the station. There was not sufficient information available to determine if it was receiving chlorine supply by barge. In order to expedite the licensing process, chlorine detectors were provided in the Control Room HVAC system intake air ducts.

To supplement the 1975 survey and to obtain additional specific information on chlorine shipments, a survey was conducted during January-February 1986 to determine whether chlorine was transported in barges on the Illinois River.

Information was collected from the U.S. Army Corps of Engineers, the U.S. Coast Guard, and Lockmasters for Starved Rock and Dresden Dams. None of the sources had information suggesting chlorine is transported on the Illinois River. Because none of the barge operators, barge terminals, or chemical companies reported chlorine shipments on the Illinois River and neither of the lockmasters was aware of any chlorine passing through their locks, it was concluded that chlorine was not shipped on the river in significant quantities.

5. Current Survey of Chlorine Shipments

The criteria used for the current survey limited sites of interest to those located between Marseilles and Dresden Island Locks and included facilities within and outside of the five-mile radius of LaSalle County Station. Previous surveys were reviewed and updated from reports from Grundy and LaSalle County Emergency Services and Disaster Agencies (ESDAs).

Table 1 shows results of the fourteen barge terminals, chemical companies, water treatment plants, and potential chlorine users that responded to the survey. None of the barge terminals located between the closest upstream and downstream dams handles chlorine. None of the chemical companies, water treatment plants or other potential chlorine users sends or receives chlorine on the Illinois River. Five facilities were identified using small quantities of chlorine. Two of these sites are located within five miles of LaSalle County Station. All five facilities stated their chlorine is transported and stored in 150-lb. cylinders via highway. CSX Railroad currently operates the closest

regularly traveled railroad to LaSalle Station. The railroad is located outside the five-mile radius of LaSalle Station.

Table 2 shows the results of five government agencies, public officials, and trade organizations contacted for the survey. The Chlorine Institute reported no chlorine is transported on the Illinois River, and has no knowledge of any chlorine producer or distributor located on the river. The United States Coast Guard stated that any company transporting chlorine on a barge is required to notify them and that they have not received such notification for the Illinois River.

In addition, the LaSalle County Station HAZMAT Coordinator reported no chlorine was used or stored on-site in single 150-lb. cylinders.

6. Conclusion of Findings

The current survey concludes chlorine is not transported in any significant quantities on the Illinois River nor within a five-mile radius of LaSalle County Station. Small quantities of chlorine are used and stored in 150-lb. cylinders at five sites. Two of the five sites identified are within the five-mile radius of LaSalle Station. Regulatory Guide 1.95 C.3 states that only single container quantities exceeding 150-lb. need to be considered for Control Room ventilation requiring automatic chlorine protection features. Therefore, the survey concludes that chlorine detectors are not required for LaSalle County Station.
