EDWIN I. HATCH NUCLEAR PLANT UNITS 1, 2
REVISION OF PREVIOUS REQUESTS FOR
TECHNICAL SPECIFICATION AMENDMENTS

Gentlemen:

On December 21, 1983, Georgia Power Company (GPC) submitted two separate requests for changes to the Plant Hatch Technical Specifications. One of these letters proposed changes to the Unit 2 requirements for usage of the Traversing Incore Probe (TIP) system; the other letter proposed changes to the restrictions for operation of the Hydrogen (H₂) and Oxygen (O₂) Analyzers in both Hatch units. On February 6, 1984, GPC submitted a proposal to change the Unit 1 Technical Specification operability limit for the High Pressure Coolant Injection (HPCI) system and the Reactor Core Isolation Cooling (RCIC) system. Each of these submittals contained a significant hazards evaluation as required by 10 CFR 50.92 (Attachment 3 to the HPCI/RCIC and TIP submittals; Attachments 4 and 5 to the H₂ and O₂ analyzer submittal).

Recently, GPC revised its methodology for conducting significant hazards reviews for Technical Specification change proposals. As a result of this, GPC has rewritten the wording submitted to the NRC by the above three letters. None of the revised reviews results in a change to the conclusions drawn in the original submittals. The four attachments enclosed with this letter should be used to replace the appropriate attachments to these previous submittals. Note that the attachment numbers and titles at the top of the enclosures to this letter coincide with the headings used in the previous submittals.
