Dear Mr. Skovholt:

Three signed copies and 20 conformed copies of Amendment No. 7 to Change Request No. 32 are enclosed. This Amendment provides and evaluates the results of the inspection conducted on the reactor coolant system.

In June 1968, in response to the AEC's letter request of December 1966, SNEC submitted a report which discussed prevention of and protection from a loss-of-coolant accident for the Saxton reactor. This report included a description of plans to conduct a thorough nondestructive inspection of the pressure-containing components and piping of the reactor coolant system and a portion of the main steam system. The plans described recognized that meaningful examinations of system components and piping could be accomplished only where adequate allowances for access existed; therefore, accessibility was the basis for determining the degree of inspectability and the method of examination. Table 2.2-1 of the report tabulated the components and areas to be examined and specified the method of examination.

Except for minor modifications in scope, the inspections outlined in Table 2.2-1 were conducted, and no defects or problems of the type that would cause concern for continued safe operation of the plant were found. The results of this inspection have been documented in sufficient detail to serve as a reference examination for subsequent inspections.

Very truly yours,

C. R. Montgomery
