R PDR

H005

Interim Report 21 covering the 90-day period from August 23, 1981 to November 22, 1981, reported the completion of the majority of tests at 100% of plant load. A major modification outage was completed in April, 1982, but significant power levels or appropriate plant conditions required for remaining tests have not been achieved. At present, the plant is in a scheduled shutdown period for refueling and routine corrective and preventative maintenance. No further initial approach to power tests were performed during the 90-day period ending February 22, 1984.

Future interim reports will report the results of any startup tests which still remain in the "open" status.
