

THE FORT ST. VRAIN
INITIAL APPROACH TO
POWER TESTS (B-SERIES)

INTERIM REPORT 31

Report for Period Ending May 22, 1984

B406280468 B40619
PDR ADOCK 05000267
R PDR

Interim Report 21 covering the 90-day period from August 23, 1981, to November 22, 1981, reported the completion of the majority of tests at 100% of plant load. Significant power levels or appropriate plant conditions required for remaining tests have not been achieved since then, however. At present, reactor power is being raised slowly as primary and secondary coolant chemistry cleanup continue following the recent refueling outage. No further initial approach to power tests were performed during the 90-day period ending May 22, 1984.

Future interim reports will report the results of any startup tests which still remain in the "open" status.
