Interim Report 21 covering the 90-day period from August 23, 1981, to November 22, 1981, reported the completion of the majority of tests at 100% of plant load. Significant power levels or appropriate plant conditions required for remaining tests have not been achieved since then. At present, the reactor is shutdown for control rod drive refurbishment. No further initial approach to power tests were performed during the 90-day period ending February 20, 1985.

Future interim reports will report the results of any startup tests which will remain in the "open" status.
