General Comment

The Yucca Mountain repository site was studied for 20 years: areas of study included engineering, geology, hydrology, seismology and thermal-chemical analysis. Hazard analysis, modeling, and probability analysis were all performed. It is beyond belief that the NRC would approve a project that involves so few safeguards and minimal examination. There is no way adequate protections are in place to prevent migration of radionuclides from the potential 10,000 canisters stored there. What happens to the SNF etc. after 40 years? It's irresponsible to approve this project with no further investigation.
