

It all started 4:00 a.m. March 27, 1979. In the town of Harrisburg Pennsylvania. The nuclear power escaped from the plant.

The consequences of the escaped nuclear energy were milk which could have iodine. The crops on the farm, danger to the unborn children, who could be born retarded, the loss of worldly goods the danger to the people by radiation, the danger of panic which could be harmful to the people themselves by looting.

Is such a plant needed for our energy, and are we using it to its fullest?

Is there any other way we can function without such harmful and dangerous ways to the public?

Is there a more secluded area which will be far away from the farms and people? Could we conserve some of the coal some would not need the nuclear energy.

In my opinion I think if when such a plant is in use for the purpose
