WASHINGTON, D.C. 20005

PROCEEDINGS

(10:06 a.m.)

CHAIRMAN SELIN: Good morning, ladies and gentlemen. This morning, the Commission will hear a briefing by representatives of the Office for Analysis and Evaluation of Operational Data concerning their role in providing oversight of operating experience and independent assessment of operational events and incidents.

AEOD was established in 1979, to analyze operational experience independently both for reactor and for nonreactor facilities that the NRC licenses. It's responsibilities were expanded in 1985, to include incident investigations and, again, in 1987, to include the independent diagnostic evaluations of operational performance.

We're looking forward to hearing about these programs, their effectiveness in providing NRC with the capability to perform independent reviews and assessments of the safety performance of NRC license facilities, and there are likely to be some speculative questions about what other ways we might use AEOD and, Mr. Jordan, what lessons you can draw from your experience as the, if you will, investigative or independent evaluation mission has grown somewhat over time.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 Commissioners, do you have any comments?

2 COMMISSIONER ROGERS: No.

3 COMMISSIONER REMICK: No.

4 COMMISSIONER de PLANQUE: No.

5 CHAIRMAN SELIN: Mr. Taylor?

6 MR. TAYLOR: Good morning. With me at the table  
7 from AEOD are Jack Rosenthal, Ed Jordan, Lee Spassard, and  
8 Pat Baranowsky.

9 Today's briefing will concentrate on AEOD's  
10 independent role and its assessment and investigation of  
11 operational experience.

12 Mr. Chairman, you've outlined some key  
13 historical points in the development of the office's role.  
14 In my discussions with AEOD, I keep emphasizing their  
15 specific role in reporting to me as providing a separate  
16 and independent safety conscience for overseeing what  
17 happens in both the reactor and other technology fields  
18 for which we have responsibility.

19 I will now ask Ed Jordan to continue.

20 MR. JORDAN: Okay. Thank you, Mr. Taylor.

21 I've been fortunate to have participated in  
22 essentially all phases of events assessment investigations  
23 and feedback of operational experience from a regional  
24 perspective, from the Office of Inspection Enforcement,  
25 through CRGR reviews of proposed generic communications,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 and to implementation of the current AEOD programs.

2 From that vantage point, I've seen the evolution  
3 of both the nature of the problems and NRC's programs to  
4 extract and feedback experience.

5 AEOD's role, as I see it, I believe, as the  
6 Chairman and Jim Taylor have identified, is tied to the  
7 AEOD and the Commission and the public, added insurance  
8 that important lessons are learned and retained.

9 The origin of the office recognized that this  
10 necessitated AEOD provide through its reviews both  
11 redundancy and diversity of reviews by the Program Office  
12 and by the regions.

13 Our presentation this past September emphasized  
14 products rather than process. This presentation  
15 necessarily will discuss process, and we will use current  
16 examples of products in order to provide that perspective.

17 AEOD's organizational feature is one of  
18 reporting directly to the Executive Director for  
19 Operations, of not being responsible for day-to-day  
20 inspection or regulation of licensees, yet maintaining a  
21 close coordination with the Program Office activities in  
22 order to utilize scarce resources as effectively as  
23 possible. In this way, AEOD provides a quality assurance  
24 and an oversight function. I plan to illustrate that  
25 point during discussions of event assessment.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 In addition to describing past activities, we  
2 will also talk about changes underway particularly in the  
3 trends and patterns area, Pat Baranowsky's area.

4 Could I have the first slide, please? (Slide)

5 In my discussion, I plan to cover AEOD's  
6 activities associated with operational experience  
7 assessment, feedback of experience, incident  
8 investigation, diagnostic evaluation, and follow-up of  
9 recommendations, and that will be the order of  
10 presentation. I'll also have a summary at the end.

11 I don't plan to discuss incident response,  
12 technical training, or operation center activities, since  
13 they do not directly contribute to AEOD's role in  
14 independent oversight of operating reactors.

15 Next slide, please. (Slide)

16 The original focus of the office was operational  
17 experience assessment. The current components of that  
18 assessment can be broken into six topics managed by two  
19 branches. Jack Rosenthal and his Reactor Operations  
20 Analysis Branch have oversight over events analysis,  
21 accident sequence precursors, and human performance  
22 activities. Pat Baranowsky's Trends and Patterns Branch  
23 has oversight over the activity of trends and patterns  
24 which includes performance indicators, abnormal  
25 occurrences. And now I'd like to discuss each of those

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 components.

2 Could I have the next slide, please. (Slide)

3 I'd like to explain how Dr. Rosenthal and his  
4 staff provide the redundancy and diversity in an  
5 independent perspective yet complement activities of NRR  
6 and the regions, in events analysis, and to do so I need  
7 to go through the sequence of their activities.

8 Each day begins with a conference call between  
9 the Operations Center, the Reactor Operations Analysis  
10 Branch, and NRR, in order to screen operational events  
11 that have occurred since the previous discussion -- and  
12 that is, from workday-to-workday, and then, of course,  
13 some accumulation over a weekend.

14 This is a value-added type discussion  
15 interactive between the individuals, and it quickly  
16 identifies short-term actions. AEOD often self-starts  
17 based on a new event added to existing concerns or work in  
18 progress.

19 Where a real-time human performance assessment  
20 is warranted, the action is proposed to AEOD management  
21 based on that morning call, and may be part of an  
22 augmented inspection team as an alternative.

23 The next major AEOD step is classification of  
24 significance from detailed review of LERs, the License  
25 Event Report, after 30 days. This identifies the level of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 subsequent review and may be the basis for further  
2 engineering study, a case study technical review. And the  
3 last sequential activity is a quantification of risk  
4 through the accident sequence precursor methodology, for  
5 the more significant events.

6 And, finally, although this sequence is  
7 complete, each license event report, each entry, remains  
8 in a database, and subsequent analysis may come back  
9 through that particular issue, combine it with another  
10 complementary report, and identify a new lesson to dig  
11 into.

12 I'd like to use a current example to show how  
13 this morning call causes the staff to look again at an  
14 issue. Recently, we had an event at the Salem plant, this  
15 was December 13th, regarding an annunciator failure.  
16 We've had a number of annunciator failures in the past  
17 year and, over the years, annunciator failures have been  
18 of concern to us.

19 I'd like to have back-up slide number 1, please.  
20 (Slide)

21 The frequency of annunciator failures is of the  
22 order of ten a year, and this is either computer or the  
23 actual visual display of windows. And, so, across our  
24 plants, that would give the likelihood at a given plant of  
25 the order of  $10^{-1}$  per year. And if one looks then at the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 loss of both the annunciator, the window, and the process  
2 computer that provides a printout of alarms -- and could  
3 I have the next back-up slide, please -- (Slide) -- those  
4 are less than one per year across the set of plants, and  
5 so this would be of the order of a  $10^{-2}$  frequency.

6 Neither the annunciators nor alarm computers are  
7 safety-related. They are not required for continued  
8 operation, however, their unavailability does necessitate  
9 compensatory action by plant operators. It's a challenge  
10 to them. And a simultaneous transient, while the total  
11 annunciator system, the visual and the printout, were  
12 unavailable, would make the operators' work much more  
13 difficult.

14 So, based on these recurring events, the staff  
15 is looking more deeply into does something more need to be  
16 done with regard to annunciators. And, so, that's an  
17 example of how we continue to accumulate information and  
18 that one is work in-progress. So, I can't give you the  
19 outcome at this time.

20 Could I have the next slide, please? (Slide)

21 COMMISSIONER REMICK: And I assume when they  
22 look at it, they'll look at the probability of having the  
23 process computer out, losing the annunciator panels, and  
24 the transient. That probability is probably pretty small.

25 MR. JORDAN: Yes.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER REMICK: I would think so.

2 MR. JORDAN: Depending on how long, and whether  
3 or not the operator is aware of it -- I guess a key point  
4 I did not bring up with regards to the Salem event and the  
5 Calloway event was, in those cases, the operators were not  
6 immediately aware they didn't have the annunciators. And,  
7 so, they were even further handicapped.

8 COMMISSIONER REMICK: Yes.

9 MR. JORDAN: And in some cases, the annunciators  
10 have been difficult to get back on. An event at Palo  
11 Verdi a year ago, it was several days in order to recover  
12 the annunciator system. And, so, certainly, it's an  
13 interesting area. It's one that is related to the human  
14 performance, the additional challenge to the operator, and  
15 we're really prepared for it.

16 CHAIRMAN SELIN: In the spirit of trying to  
17 concentrate more on procedural and substantive questions  
18 in an issue like this, specifically the annunciators, do  
19 you have access to, and do you go into PRAs, to see if we  
20 can calculate a difference in operator performance with  
21 and without annunciators available, or is that beyond your  
22 --

23 MR. JORDAN: That's an attempt we'll make, and  
24 I'll ask Jack Rosenthal to respond.

25 MR. ROSENTHAL: That's it, we'll make an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 attempt. I'll use the accident sequence precursor program  
2 myself, and I've already spoken to RES, and they're going  
3 to try something by using NUREG 11-50 models, since  
4 they're higher, so we'll work together.

5 CHAIRMAN SELIN: I would hope you would get  
6 beyond these labels, which you know I'm not very fond of -  
7 - safety required, safety related, et cetera -- and try to  
8 get directly to the probabilities, and see what we know  
9 about people's performance with and without annunciators,  
10 specifically when they don't have annunciators but they  
11 don't know that they don't have annunciators, as  
12 Commissioner Remick said, there is a sequence of events,  
13 not all of which are moderately unlikely but,  
14 nevertheless, the idea that AEOD won't be misled by some  
15 label and take a look and say, you know, we are not  
16 comfortable that this is well within the envelope of a  
17 plant, is very attractive.

18 MR. TAYLOR: Yes, sir. I initiated a call when  
19 I saw the last Salem event, keeping in mind the previous  
20 occurrences, and that they are not all identical, but that  
21 it was an appropriate situation to take a look at. I  
22 don't know exactly what will come out of it, but it  
23 appears to need some attention not only by us, but perhaps  
24 by industry, to look for what's causing the failures, any  
25 common features.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 MR. JORDAN: And my comments about not being  
2 safety-related and not being relied upon, is not an  
3 indication that we don't examine it. I mean, that's  
4 simply the classification that has occurred traditionally.  
5 And, so, we begin to say, now, based on this experience  
6 compiled, is there not a problem.

7 COMMISSIONER REMICK: The thing that surprised  
8 me was an annunciator going off and not knowing it. As  
9 long as the process computer is working, chances are they  
10 are going to hear the click, click, click of the process  
11 computer to know that they're --

12 MR. JORDAN: Yes, right.

13 COMMISSIONER REMICK: -- and cause them to look  
14 up. But if you lose the annunciators, don't know you've  
15 lost it, and then lose the process computer, then I think  
16 you are kind of like in the position of not knowing things  
17 are happening.

18 MR. JORDAN: That's a very awkward position,  
19 yes.

20 MR. ROSENTHAL: Again, almost belaboring the  
21 point, technically, I'm interested in those situations,  
22 and we do have them, in which there's an electronic pinch  
23 point, so that although the computer is up and running and  
24 executing the program, in fact, there's no information to  
25 the computer at the very same time that the annunciator

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20004

1 has failed. From the human factor standpoint, we like to  
2 use the term "alertment". Once -- I didn't make it up --  
3 "alertment".

4 MR. JORDAN: Is that a word?

5 MR. ROSENTHAL: Alertment.

6 CHAIRMAN SELIN: Whatever happened to English.  
7 (Laughter.)

8 MR. JORDAN: Will my SpellCheck pull that up?

9 MR. ROSENTHAL: And that is, I think your  
10 observation is very correct, and that is, once they are  
11 aware that something's wrong, you can double crew, you're  
12 at heightened level of awareness, et cetera, and you can  
13 go. And, so, one of the concerns is, what happens when  
14 you think things are okay, and you're more relaxed and, in  
15 fact, you've lost one or more information systems and  
16 don't know it.

17 CHAIRMAN SELIN: Right. Commissioner Remick's  
18 "observations" are always right -- right on the money.

19 (Laughter.)

20 MR. JORDAN: Could I have the next slide,  
21 please? (Slide)

22 We discussed the accident sequence precursor  
23 discussion at the September meeting. And, previously, Dr.  
24 Murley and myself had briefed the Commission about a year  
25 ago, on our uses of this tool jointly between NRR and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 AEOD. The tool remains a very important element, and  
2 we're investing even further in it in order to improve the  
3 timeliness of information to reduce modeling weaknesses,  
4 and to fill in the missing data for 1983 through 1984.

5 This past July, the accident sequence precursor  
6 output successfully identified the Shearon Harris safety  
7 injection problem of 1991, as the largest contributor to  
8 risk for the year. This was a value of the order of  $6 \times$   
9  $10^{-3}$  in terms of its core damage probability.

10 CHAIRMAN SELIN: Contingent core damage  
11 probability.

12 MR. JORDAN: Yes, conditional core damage  
13 probability.

14 CHAIRMAN SELIN: Are you involved, Mr. Jordan,  
15 in an attempt to try to take this sequence of individual  
16 precursors and put them together and get some kind of  
17 indicators about looking back over the year at each event  
18 at its most risky point, if you could somehow aggregate  
19 over these events --

20 MR. JORDAN: Indeed.

21 CHAIRMAN SELIN: -- what the risk indicator risk  
22 was for the year, whether it's a sum of contingent  
23 probabilities, or a post-year probability, or just some  
24 kind of replicable indicator?

25 MR. ROSENTHAL: The staff is working on it.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 RES, Eric Becktro has the lead. I attended a meeting,  
2 actually last week, with three statisticians and Ali  
3 Modaras from University of Maryland, and it was your idea,  
4 let's put this on a firm footing and to get something  
5 published that the outside community would agree to, and  
6 that is proceeding.

7 CHAIRMAN SELIN: I think that -- I mean, I don't  
8 want to mislead you. The most useful thing that happens  
9 out of these are the individual pieces of engineering.  
10 This is, in effect, our practical, actual experience, and  
11 models are not what we can learn from what really almost  
12 happened or did happen is the most valuable thing, but  
13 some of these aggregated looks as well, to look at, saying  
14 that is our empirical experience, what is the sort of sum  
15 of how close we got to different accidents, what's the  
16 trend, and what are the effects would be useful, not as a  
17 replacement for the detailed analysis that you do, but in  
18 addition to that analysis.

19 MR. JORDAN: I think it would be a beneficial  
20 output of some that would have more value. The example  
21 use of the Shearon Harris event being highlighted in its  
22 significance by the accident sequence precursor is both  
23 gratifying and frustrating. And Dr. Murley and I have  
24 spent some time arguing and discussing the issue.

25 In this case, the tool did what it was designed

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1523 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 to do, but our analysis was untimely, and we are all  
2 disappointed -- I think Jack Posenthal, that his people  
3 didn't find through the normal deterministic reviews, the  
4 true significance of the event. It was identified as  
5 being "significant" by our classification, but not "really  
6 significant" as the ASP did.

7 So, we are actively reducing this lag time, and  
8 both AEOD and NRR are examining our own processes, to try  
9 to make sure that conditions like existed at Shearon  
10 Harris are treated in the same fashion as events in terms  
11 of their risk significance and their interest to the  
12 staff.

13 Could I have the next slide, please. (Slide)

14 The Human Performance Case Study was published  
15 earlier this month, and the important element here is to  
16 be able to communicate back to industry as much as  
17 practical of what we learned, in a timely fashion. This  
18 case study did not, in fact, come up with recommendations,  
19 and so the discussions that we have had internally and  
20 with Tom Murley have identified that the best thing we  
21 can do is to package the case study, transmit it to  
22 utilities with a personal letter from Tom and myself  
23 indicating "it's available for your use", and not cause  
24 licensees to respond to it directly, or to direct them to  
25 take actions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1           We recognize the complex nature of the  
2 interaction between procedures, training, organizational  
3 factors and, from the 16 events that we've examined, we're  
4 most cautious about specific recommendations. These  
5 combinations are different at different plants, and we  
6 really want to only convey our experience that utilities  
7 may use as appropriate.

8           It does certainly identify the need for the  
9 agency to be able to collect more information in order to  
10 come to views about the shift technical advisors, about  
11 the level of staffing, about the level of detail and  
12 procedures. I think there are certainly some principles  
13 that can be extracted and fed back a little more strongly.

14           The work by the Office of Research led to our  
15 using this protocol, and there has been a protocol  
16 provided to NRR that's in now the Human Performance  
17 Procedure for inspectors to apply in order to attempt to  
18 extract more lessons.

19           So, we're working with them in order to try to  
20 collect information in a little more efficient way, and  
21 establish a database that would be able to be used to  
22 search and pull up useful lessons.

23           Could I have the next --

24           COMMISSIONER REMICK: Before leaving that, I was  
25 a little surprised at your raising the issue of the dual

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 role again, although you certainly should if there is a  
2 question, but there certainly has been a difference of  
3 opinion on that forever.

4 Do you happen to know what the current  
5 distribution might be amongst the plants, of stand-alone  
6 STA versus the dual role, how that stands?

7 MR. JORDAN: That information was just compiled.  
8 Do we have an answer?

9 MR. ROSENTHAL: We'll get that for you, sir.

10 MR. JORDAN: NRR did a survey of all plants to  
11 get a clear understanding of how they were apportioned.

12 COMMISSIONER REMICK: I was one who felt the  
13 Commission did the right thing by going to dual role, so  
14 that in contrast to the cases -- I don't know if they  
15 still exist -- where there was a young buck engineer  
16 brought in, put in a trailer 24 hours a day, and if  
17 something happened, he was called to the control room and,  
18 if he ran, he could make it within the ten minutes, I  
19 guess, that we required, and so forth. But I always  
20 questioned how much help he was really going to be to the  
21 operators, and how much confidence --

22 MR. JORDAN: I agree.

23 COMMISSIONER REMICK: -- and to that extreme.  
24 And I always thought, well, gee, having this person on-  
25 shift where he's accepted, he knows what the plant is, but

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 I realize that they could have difficulty in standing  
2 back. So, I don't know what the optimum is, but I hope  
3 when you're looking at it, you look at those two extremes,  
4 if they exist.

5 MR. JORDAN: Exactly. And that's the problem we  
6 have, is that the information is sparse in the way we are  
7 collecting it now. So, we are unable to give any advice  
8 as to what generally works better and, you know, people  
9 have opinions, but they're not really based on enough  
10 experience to be able to convey.

11 COMMISSIONER REMICK: Yes.

12 MR. JORDAN: And we're very interested in being  
13 able to collect more than sparse information.

14 Could I have the next slide, please.

15 COMMISSIONER REMICK: Oh, I'm sorry. I blinked  
16 on your slide number 5. I had a question there. You  
17 point out that there are failures, not always in PRAs, and  
18 I guess I'm not surprised at that. What would be more of  
19 interest to me in the failures that have been identified  
20 that were not considered in PRAs, what was their, using  
21 your words, "real significance" from a risk standpoint?

22 MR. ROSENTHAL: Let me give you an example. One  
23 of the top events was at Fitzpatrick, where we discovered  
24 that the low pressure safety injection valves wouldn't  
25 operate given a large break LOCA. Now, for a normal PRA

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 modeler, you're not going to pay that much attention to  
2 large-break LOCA, and you'll put more effort in the  
3 detailed modeling of loss of off-site power, and certain  
4 transients, and odd small break LOCA. Okay.

5 So, even in the Fitz PRA where they had modeled  
6 the low-pressure injection system and they modeled the  
7 pumps, and they didn't even model the injection valves.  
8 And that was the proper thing for the analyst to do, as  
9 long as he thought that the injection valve failure rate  
10 was -3, that the pump failure rate was -2, and he's  
11 talking about a -4 sequence in the first place.

12 The day you discover that you think that the  
13 failure rate of those valves given conditional on large-  
14 break LOCA is closer to 1, then that becomes the dominant  
15 part of that train and, in fact, becomes an important  
16 overall sequence because you perceive the system then  
17 reliability low. So, that was something where until the  
18 operating experience revealed it, it was just absolutely  
19 neglected.

20 MR. JORDAN: That's a good example.

21 COMMISSIONER REMICK: From what you said, I  
22 didn't get the impression it was neglected, but perhaps  
23 the wrong conclusion had been drawn that it was the pumps  
24 that were more important than the valves, and that's why  
25 the valves were left out.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 MR. ROSENTHAL: But if you use generic failure  
2 data, then that is the right conclusion. Another one,  
3 again, discovered by operating experience, the electrical  
4 cabinets for the diesel controls at a plant were not  
5 ventilated. And through normal situations, you have room  
6 cooling, and so that the system would run on test just  
7 fine. And then it was recognized that if you, in fact,  
8 had a loss of off-site power, you would lose that -- the  
9 normal room cooling, and then the electrical cabinets  
10 could overheat and, in turn, the very diesels that you're  
11 relying on would fail.

12 And, so, you're picking up operating experience  
13 insights that way that just aren't in the PRA. That's one  
14 of the terrific uses.

15 COMMISSIONER REMICK: I can understand that's  
16 valuable. Two questions, follow-on questions, on that.  
17 Of those two events, what was the ultimate risk  
18 significance? Was it carried out, putting that in?

19 MR. ROSENTHAL: Yes, these were -4 type  
20 scenarios -- I mean, one of the top ten type events.

21 COMMISSIONER REMICK: Okay. When you say -4, -4  
22 core damage frequency, or --

23 MR. ROSENTHAL: No, no. I'm sorry. These are  
24 all -- I mean, all the numbers that we're citing are  
25 conditional probabilities and, in fact, I can see where

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 this becomes the issue of how do you relate that to the  
2 PRA which is a frequency of core damage.

3 That was a -- the electrical cabinet problem  
4 that I described and the valve problem I described were  
5 both conditions, and you multiply that by the likelihood  
6 of the initiator event over the exposure period in order  
7 to come up with a measure of the risk significance.

8 COMMISSIONER REMICK: Right, right. And I  
9 didn't know if that had been done or not.

10 MR. ROSENTHAL: Yes.

11 COMMISSIONER REMICK: I'm not belittling the  
12 fact that this information is extremely valuable. I'm  
13 just wondering, though, from the standpoint of either core  
14 damage frequency or public risk, were these significant  
15 findings or not? And I assume you don't have the answer.  
16 That's okay.

17 The next question is, suppose that we do find  
18 them to be significant, how do we then convey that out to  
19 the people who will be doing PRAs next year, or three  
20 years down the line, that they think about that failure?  
21 Do we have a mechanism in those cases that you just  
22 mentioned, of getting that out? Let's assume that they  
23 were --

24 MR. ROSENTHAL: You'll hear about the valves in  
25 a little while.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 COMMISSIONER REMICK: Okay.

2 MR. ROSENTHAL: And generically, Ed?

3 COMMISSIONER REMICK: Same valves?

4 MR. ROSENTHAL: It's through just general  
5 communication. I don't have a specific targeted program.

6 MR. JORDAN: So, if a particular -- let's say  
7 the cabinet was, in fact, a significant contributor to  
8 risk, then we would recommend an action to communicate it  
9 through, at the very least, an information notice.

10 COMMISSIONER REMICK: Information notice,  
11 something like that, yeah. Okay.

12 MR. JORDAN: And I think that is a key we need  
13 to keep in mind, that having information is useless. To  
14 learn a lesson, you have to convey it to the industry or  
15 to the regulator in the right place.

16 COMMISSIONER REMICK: That's right.

17 MR. JORDAN: So, we're intent on that.

18 Could I have the next slide, please -- Human  
19 Performance. (Slide) Okay, we're done with that.

20 Trends and Patterns then. I'm sorry. (Slide)

21 The principal activities of trends and patterns  
22 in the past, were aimed at identification of issues such  
23 as to seek learning curve of new plants in the early  
24 1980s. The development of performance indicators and  
25 reporting of abnormal occurrences flowed from activities

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 associated with developing, maintaining and using events  
2 databases.

3 Today, more analysis is being done with the data  
4 in terms of statistical significance and risk perspective.  
5 Emphasis includes conditions in addition to events. Dr.  
6 Baranowsky's branch is actively developing tools to help  
7 determine when a previously learned lesson was ineffective  
8 or has worn off. Use of these tools include hardware  
9 items, human performance, regulatory and safety issues,  
10 and industry initiatives.

11 And, so, I think we're going to find that the  
12 events analysis side is more in the mode of finding, let's  
13 say, new sequences or new problems, whereas the trends and  
14 patterns is going to be refining or identifying cases  
15 where previously learned, or previously communicated,  
16 issues have resurfaced. And certainly a clincher now in  
17 order to have a response and a recognition of significance  
18 is a meaningful assessment of the risk associated with a  
19 particular issue.

20 And, Pat, since you've recently provided me with  
21 a program plan, would you like to elaborate on this?

22 MR. BARANOWSKY: Okay. Basically, what we're  
23 talking about doing is looking at, say, an issue, whether  
24 it's a hardware or human performance issue, and  
25 identifying what level of risk was associated with it, or

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 performance of a component, and then we initiate some sort  
2 of regulatory activity, like a rule or a bulletin, or  
3 maybe there's an industry initiative, and then tracking  
4 performance subsequent to that, and identifying whether or  
5 not there actually has been an improvement in performance,  
6 whether or not the types of events that occur subsequent  
7 to the implementation at whatever activity occurred, are  
8 consistent with the lessons that we had learned the first  
9 time around when we came up with the fix, and then, given  
10 whatever level of performance we identify, trying to be  
11 able to put that into some kind of a risk context.

12 In this case, what we'd be doing is using things  
13 like the NUREG 11-50 PRA models and other PRA models, to  
14 put things like equipment failure rates, or human  
15 performance estimates in, that would be based on the most  
16 current understanding that we have, based on recent data  
17 that we can get from LERs or other sources. It doesn't  
18 just have to be LERs.

19 And we're going to spend a fair amount of time  
20 trying to develop a capability of doing common cause  
21 failure analysis in a rigorous way, as opposed to saying  
22 in our judgment it has a certain value, which is one of  
23 the weaknesses that we've seen in some of the PRAs that  
24 were done in the past.

25 We're trying to set up a database and an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 analysis scheme that makes use of the methods that were  
2 developed by the NRC and EPRI. We've got the method. We  
3 think we know how to do it. We just need to put them in  
4 practice, and that requires setting up the data properly  
5 and having the calculational capability in a software  
6 package that we can use. And, so, we're working in AEOD  
7 and with RES to set these types of things up.

8 MR. JORDAN: Okay. Can I have the next slide,  
9 please? (Slide)

10 I'm not going to spend much time on performance  
11 indicators. Because they do play an important role and  
12 are an objective measure of licensee safety performance,  
13 I wanted to bring them up. They allow us to trend  
14 individual plant performance, and they also give us some  
15 insights about industry performance. Since we've been  
16 using the same indicators extracted in the same method for  
17 some time, they are comparable.

18 CHAIRMAN SELIN: That's very good, but I wanted  
19 to ask you if you've ever tried to systematically relate  
20 these indicators to anything that's more directly  
21 concerned with risk. I mean, can we correlate risks with  
22 emergency system activations? Is there any difference  
23 between automatic scrams and manually-induced scrams, et  
24 cetera? In other words, have we carried the evaluation a  
25 step further?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. JORDAN: Yes. In fact, the origin of the  
2 indicators was based on selecting indicators that were  
3 related to the frequency of arrival of transients and the  
4 availability of the safety systems, and then trying to  
5 look at organizational and human performance. The last  
6 piece we still don't have a good handle on. It becomes an  
7 outcome. So, some of the indicators that we use do, in  
8 fact, relate to frequency of transients and safety system  
9 reliability.

10 CHAIRMAN SELIN: That's all fine, but that has  
11 more to do with you have plausible things to look at, but  
12 my question is, have you gone the next step in evaluating  
13 your own evaluators to go back over sometime and say,  
14 we've been tracking these indicators, and we've been doing  
15 some -- whether it's your accident sequence or some other  
16 calculations that are more empirical -- and it does, in  
17 fact, look as if there is a pretty high correlation, or  
18 not much of a correlation, between risks or performance  
19 versus these performance indicators, or is that a  
20 meaningless question, the answer is so tight you don't  
21 have to evaluate it.

22 MR. JORDAN: Not a meaningless question. Our  
23 problem is, I think, insufficient data. The accident  
24 sequence precursor is not dense enough in terms of data on  
25 a plant basis and, by rolling it up over time, the plant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 performance changes --

2 CHAIRMAN SELIN: I wasn't thinking of plant, I  
3 was thinking of the indus\*try performance trend is where  
4 you're basically averaging over the -- or aggregating over  
5 the plants to be looking for overall trends.

6 MR. JORDAN: Oh. We have a pretty much  
7 coincidence in terms of what we see of the aggregated  
8 trends of performance indicators and what we see with the  
9 roll-up of the conditional core damage probabilities  
10 across plants. So, where we were seeing steep improvement  
11 in that conditional core damage probability, we saw steep  
12 improvement in the performance indicators as I've said.

13 CHAIRMAN SELIN: Have we published this at some  
14 point?

15 MR. JORDAN: Sir?

16 CHAIRMAN SELIN: Have we published this at some  
17 point?

18 MR. JORDAN: We convey it in a package fashion  
19 and, for instance, at the last briefing we gave, we  
20 displayed essentially without units, the set of  
21 performance indicators, showing generally the improvements  
22 from the early '80s into 1990, and then a plateau. And we  
23 can see from the accident sequence precursor data, the  
24 same kind of a slope during the same time.

25 MR. ROSENTHAL: The same correlation.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. JORDAN: Yes.

2 MR. ROSENTHAL: If you're looking for  
3 quantitative statistical correlation, for example, you can  
4 take the ASP results, national average, and you know how  
5 much of that is contributed by transients, you can  
6 calculate trips as a function of time, and then you can  
7 just do a correlation analysis and say, what's the  
8 coefficient, and does it correlate and, in fact, it  
9 correlated with a very high confidence limit.

10 CHAIRMAN SELIN: We've done this? You've done  
11 that calculation?

12 MR. ROSENTHAL: Yes.

13 MR. JORDAN: And similarly, in fact, in the  
14 origin of the performance indicators, we were using SALP  
15 as the benchmark, that if we could see trends in plant  
16 performance from year-to-year that were comparable with  
17 trends in SALP, and show statistically a correlation, then  
18 that was our validity check, and that was quite  
19 successful.

20 COMMISSIONER ROGERS: But I wonder if that  
21 really is valid. I mean, in the sense that when the  
22 people are doing SALP evaluations, they have these  
23 indicators as part of their information base.

24 MR. JORDAN: They didn't, at the time we were  
25 creating the performance indicators.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 COMMISSIONER ROGERS: Well, they do now.

2 MR. JORDAN: They do now.

3 COMMISSIONER ROGERS: And, so --

4 MR. JORDAN: So, it could be a self-fulfilling  
5 prophesy.

6 COMMISSIONER ROGERS: Well, yeah. I mean, it's  
7 hard to consider those as totally independent variables --

8 MR. JORDAN: We need another independent set of  
9 something.

10 COMMISSIONER ROGERS: -- yeah, or assessments,  
11 that if you're making a SALP assessment with this kind of  
12 information in front of you, you know, you're going to  
13 integrate those in your head, to some extent, and I don't  
14 know that you can make that kind of a statement that one  
15 validates the other, or vice-versa.

16 MR. JORDAN: Right, but the point I was making  
17 was that at the origin of the performance indicators,  
18 we'll use the existing SALP and backdate it in terms of  
19 the events --

20 COMMISSIONER ROGERS: Yeah, from the very  
21 beginning.

22 MR. JORDAN: -- and that was a very strong  
23 correlation.

24 CHAIRMAN SELIN: I'd like to make this quickly -  
25 - I'm not being critical of what we're doing, and I'm

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 certainly not being critical of these indicators as being  
2 very plausible based on the information available, I'm  
3 just saying in the spirit of evaluation, I'd like to see  
4 some net evaluation, and Dr. Rosenthal has indicated more  
5 of this has happened than I was aware of, where we look  
6 not only at the plants, but we look at our methods and see  
7 do these -- some of them are easily measurable, but  
8 they're not directly related to end points. Others are  
9 directly related to end points, but it's hard to measure  
10 them and get the quantity -- I mean, you can't look at the  
11 core damage probability meter in a plant and say what is  
12 it today.

13 MR. JORDAN: No.

14 CHAIRMAN SELIN: But it is important to continue  
15 to do the evaluation or your evaluation tools, to see if  
16 the surrogates are, in fact, as closely related to what  
17 we're really interested in, as they appeared to be when  
18 they were first defined when you used the SALP scores, et  
19 cetera. And this is just more of a -- as we go on, this  
20 is something I'd be interested in as opposed to something,  
21 gee, it's terrible that you're not doing this, or that  
22 there's reason to doubt that these performance indicators  
23 are pretty good, they probably are really quite good.

24 MR. JORDAN: And to be fair and direct, we have  
25 reduced the developmental type effort in performance

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 indicators. We say we have a set, they work reasonably  
2 well. We have recently proposed peer groups and, in fact,  
3 have now a view from the staff that a peer group breakout  
4 in terms of three-loop Westinghouse plants, four-loop  
5 Westinghouse plants, as peer groups, and CE plants and so  
6 on, is a very beneficial cut, and gives us a little more  
7 insight about the set of plants within that group, and  
8 also cut by fuel cycle, that if we're looking at  
9 performance during operation --

10 CHAIRMAN SELIN: All I'm saying is that, on the  
11 one hand, the more detail you get, the more insight you  
12 get into specific events, but the more you lose track of  
13 whether overall safety is improving or not because -- for  
14 the same reason, you're looking at smaller, smaller sets,  
15 in more, more detail.

16 MR. JORDAN: Yes.

17 CHAIRMAN SELIN: When you look for these  
18 aggregate indicators about, you know, how are we doing --  
19 we're spending \$500 million a year of eventually the  
20 taxpayer and the ratepayer's money -- how are we doing?  
21 Those get to be simple answers. And the more you try to  
22 answer those, the more you lose the detail, and I just  
23 want to make sure we're doing a little bit of both, that  
24 eventually we should be able -- have to come up with a  
25 relatively simple indicator of just overall performance,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 even though that obviously integrates over lots and lots  
2 of very interesting parameters.

3 MR. JORDAN: Yes.

4 CHAIRMAN SELIN: And I'm somewhat reassured that  
5 we're doing more of that than I'm aware of, but --

6 MR. JORDAN: We will convey more of it, yes,  
7 sir.

8 COMMISSIONER REMICK: One other question on  
9 performance indicators, and I can see how it can be  
10 extremely valuable to AEOD, as I understand how you're  
11 using it, but just as a matter of curiosity, what  
12 indications do you have that other offices or regions  
13 utilize the performance indicators? Do you have evidence  
14 of strong use? Do you get calls from regions that say "we  
15 haven't gotten the most recent one, we need it"?

16 MR. JORDAN: I think the larger use is in  
17 preparation for the semi-annual Reactor Safety meetings,  
18 and so they are an input. They help select which plants  
19 get a full discussion, and help identify anomalies in  
20 terms of here's a plant in performance indicator space  
21 that looks strange, and we didn't have it on the list to  
22 talk about. It's that kind of a check.

23 We, of course, condition performance indicators  
24 so that the inspector wouldn't go beat up on a particular  
25 plant with respect to his outage indicator declining. So,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 we purposefully direct the individual inspectors not to  
2 apply it directly. It's like the managers do, and we do  
3 get comments from them in terms of its value.

4 COMMISSIONER REMICK: That reminds me, if I  
5 recall, back at the time the PIs were being developed, the  
6 Commission directed that no other performance indicator  
7 should be used by the staff, they shouldn't have their own  
8 set. Is there any indication that that's being fulfilled?

9 MR. JORDAN: Yes. We've had some occasions  
10 along the way, and they have stopped those.

11 MR. TAYLOR: Yes, there were some homemade sets  
12 that have disappeared by this time.

13 CHAIRMAN SELIN: I realize that I've asked most  
14 of the questions, but I'd like you to try to finish by  
15 about 20 after because I've got about ten minutes of  
16 related topic I'd like to ask you to speculate about when  
17 we're done.

18 MR. TAYLOR: That's fine, Commissioner.

19 MR. JORDAN: Yes, sir. Okay. In abnormal  
20 occurrences, the next slide -- (Slide) -- I think the only  
21 thing I would say there is, this is a method for the  
22 agency to communicate with Congress about the very worst  
23 reactor events. And over the years, since 1987, those  
24 events per year from reactors have declined to zeroes and  
25 ones, from fours and fives.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 Feedback of experience I'd like to spend just a  
2 little bit of time on because that, I believe, is the  
3 heart of our activity. That's slide number 10, please.

4 (Slide)

5 And this is a listing of what I think are very  
6 important feedback that the AEOD office was instrumental  
7 in through case studies aand having generated generic  
8 letters, bulletins, and so on. And I would identify air  
9 systems as being a nonsafety system that the staff  
10 identified as being a significant contributor, and I think  
11 that has been a great benefit.

12 I'd like to then jump all the way down to the  
13 last one on the list, for which no action yet has been  
14 taken because we have only this month published our  
15 report, and this is pressure locking of gate valves.

16 This is a recurring, continuing problem, "a  
17 problem that hasn't been fixed" is the best way to  
18 describe it, and so I think first I need to explain what  
19 the safety issue is. These double-disk wedging gate  
20 valves have the capability of a common-mode failure  
21 because of a pressure locking of this wedging gate into  
22 the valve body. The phenomenon is that the valve operator  
23 cannot overcome these very high loads of the friction  
24 forces and the actual direct force of this pressure.

25 Could I have the backup slide number 3, please.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 (Slide)

2 A schematic of a gate valve, and the issue is  
3 that from the reactor side, which is not the flow side,  
4 pressure over time and through a leaking check valve,  
5 normally, causes a buildup in this valve bonnet, and it's  
6 labeled excess pressure. It would be building up to the  
7 same as reactor system pressure approaching it. Given a  
8 depressurization incident, then this pressure that has  
9 built up in the bonnet does not leak off in the time frame  
10 that one needs to open this valve in order to inject low-  
11 pressure injection RHR, or whatever the safety function  
12 is, and this is a nonsurveillance disclosed type event  
13 because you don't do surveillance of that kind of valve  
14 while you're pressurized, nor do you do a surveillance in  
15 the fashion that would catch the kind of problem you have.

16 So, the instances that have been identified over  
17 the years have been somewhat serendipity in terms of  
18 identifying the problem. A simple solution exists, and  
19 there is a drilled hole indicated on that particular  
20 diagram that would vent then the flow side to the bonnet.  
21 Another fix is a leak-off line from the bonnet to the flow  
22 side of the valve, and there are other possibilities. But  
23 I think my main point here is that this is a relatively  
24 low likelihood event, but one that is a common mode, if it  
25 exists in one of the two trains, it likely exists in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 second train,, and certainly the plant condition that  
2 would get you there would be existent in the other system.  
3 And, so, it's one that over years the NRC has communicated  
4 to the industry.

5 The staff has done a survey -- and could I have  
6 slide 12, please -- (Slide) -- at six plants and, in this  
7 case, the pressure locking at those plants generally  
8 remained a credible problem. And in talking to the  
9 engineering staff at the plant, they say, "Well, we've  
10 never experienced a problem", and when knowledgeable NRC  
11 staff explained in detail the sequence in which one could  
12 get into the problem, then the utility people say, "Okay,  
13 yeah, that could be an issue", and then they go look.

14 So, I think the real problem is that we haven't  
15 communicated it adequately, properly. Tom Murley and I  
16 have spent some time discussing this issue and how we  
17 might properly communicate it in a way that will get the  
18 desired action.

19 We are proposing a bulletin or generic letter,  
20 and we are planning a workshop with industry in one  
21 regional area so that our best engineers who are vitally  
22 convinced of the significance of the problem, can  
23 communicate with plant engineers in that region, from the  
24 utilities, and exchange their understanding with the  
25 experience of the utility people in order to come up with

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 the proper fix.

2 Now, on slide 13, there is a list of  
3 communications, starting from 1977, a circular, a  
4 Westinghouse service letter, a previous AEOD study in  
5 1984, an industry piece of feedback, and even a current  
6 information notice.

7 CHAIRMAN SELIN: All of which suggests the  
8 problem continues to exist.

9 MR. JORDAN: It continues to exist. The  
10 frequency of occurrence of finding the problem, even  
11 though it is, as I say, kind of a serendipity to find it,  
12 has, in the last three years, been greater than previous  
13 years. So, it still exists out there. And, so, I think  
14 that identifies one of the roles of AEOD very clearly, to  
15 continue to seek areas in which lessons simply haven't yet  
16 been learned, or fully utilized.

17 COMMISSIONER ROGERS: Well, I'd certainly agree  
18 with that bu', you know, it really strikes me as bizarre  
19 that such a problem of this has existed for so long. I  
20 mean, these valves have been used in industry for years  
21 and years, and it's got to be something that has been  
22 experienced in many other contexts, and why on earth, you  
23 know, it's still a problem, is beyond me.

24 MR. JORDAN: I wouldn't want to spend much more  
25 time on it, but there are some interesting --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER ROGERS: No, no, I think what  
2 you're doing is absolutely the right thing.

3 MR. JORDAN: No, I mean, in discussion. But  
4 there are some interesting features. The upstream check  
5 valve has to be assumed to be absolutely perfect, and the  
6 gate valve has to be assumed to leak a little bit in order  
7 not to have the problem. And the nature of things is that  
8 the upstream check valve is going to leak, and we've  
9 worked very hard on gate valves and leaks, and they seal  
10 very well now.

11 CHAIRMAN SELIN: Congratulations.

12 (Laughter.)

13 MR. TAYLOR: So much for diligence.

14 COMMISSIONER REMICK: Again, a point of  
15 clarification. You said something to the effect that more  
16 recently you've found more of these. Now, is this found  
17 that valves did not open when called upon, or found that  
18 people were not aware of the problem to fix, or --

19 MR. JORDAN: No, these are actual cases where  
20 the valve did not operate.

21 COMMISSIONER REMICK: Okay.

22 MR. JORDAN: And then the study, the review at  
23 six plants identified that those six plants had done very  
24 little, if anything, about this kind of an issue. And  
25 this was a nonregulatory type review -- you know, what is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 your experience? What do you do about this?

2 COMMISSIONER REMICK: Okay.

3 MR. JORDAN: Okay. Next is slide 14 -- (Slide)  
4 -- the incident investigation program. We have discussed  
5 that program extensively with the Commission.

6 And I think I would make the point in terms of  
7 our role -- slide 15 -- (Slide) -- we are managing this  
8 program for the Executive Director for Operations. We  
9 maintain documentation. We provide training for a cadre  
10 of people that are ready to do incident investigation, and  
11 we provide administrative support, review the report for  
12 completeness, and then -- I think the point I would want  
13 to make then is, we continue to follow up on the  
14 recommendations from the incident investigation program,  
15 from the diagnostic evaluation program, and from review of  
16 case studies, so that we are keeping track of those  
17 recommendations issued under the EDO's signature,  
18 verifying closure of those items, and looking at -- and  
19 this is more recently -- looking at the adequacy of those  
20 reviews.

21 COMMISSIONER REMICK: How many IIT so far,  
22 including the current one? Is it seven or eight now?

23 MR. TAYLOR: The current one will make it eight.

24 COMMISSIONER REMICK: Okay.

25 MR. JORDAN: Right.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER de PLANQUE: In the paper, you  
2 talked about the option of using that in a manner where  
3 you report directly to the Commission. How do you  
4 envision this?

5 MR. JORDAN: Okay. That's a new paper that's on  
6 its way.

7 MR. TAYLOR: It's signed.

8 MR. JORDAN: It's signed. Okay.

9 COMMISSIONER de PLANQUE: Okay. It's coming.

10 MR. TAYLOR: Right. It's in the mail.

11 (Laughter.)

12 COMMISSIONER de PLANQUE: It's in the mail.  
13 Okay.

14 MR. SPESSARD: We had anticipated that one would  
15 arrive before the other one.

16 COMMISSIONER de PLANQUE: Okay.

17 CHAIRMAN SELIN: Another example of excessive  
18 diligence, obviously.

19 (Laughter.)

20 MR. JORDAN: I can talk about it --

21 CHAIRMAN SELIN: It's okay. No. We'd rather  
22 have the paper in front of us before we get into a  
23 discussion on it.

24 MR. JORDAN: Okay. I'm going to Lee, and I'm  
25 going to hurt your feelings badly, skip over the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 diagnostic evaluations.

2 COMMISSIONER REMICK: I have a couple of  
3 questions in that area, but --

4 MR. JORDAN: All right, sir, why don't I respond  
5 to your questions then.

6 COMMISSIONER REMICK: Okay.

7 MR. JORDAN: Or maybe Lee should respond to your  
8 questions.

9 COMMISSIONER REMICK: One -- and I must admit,  
10 this goes back a few years ago -- I had some personal  
11 concerns about parts of the diagnostic evaluation, in the  
12 human factors area, questions that were suggested where  
13 people quiz supervisors, what do they think of their  
14 supervisor, and so forth. I had concerns about that,  
15 those still continue. But some of the things that I have  
16 heard about diagnostic evaluation -- and I'm not  
17 criticizing the concept -- where there are indications  
18 that a plant might be heading for trouble, and the EDO  
19 approves a diagnostic evaluation to try to get at the root  
20 cause and get a better understanding, that concept is  
21 good.

22 Some of the things I hear from people, though,  
23 that have had them, are concerns about whether the  
24 findings and recommendations and the conclusions and  
25 recommendations relate to safety, or are they just

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 individual inspector's preferences.

2 Let me give you an example -- it's not an actual  
3 example, but it comes close to one that was related to me.  
4 I'm on a diagnostic evaluation. The inspector is talking  
5 to somebody -- one of the trainers in the training group,  
6 and he notes that they had intended to conduct some  
7 courses by the end of March, and they weren't conducted  
8 until the first week of April. And the guy says, "Yeah,  
9 yeah, we had really hoped to do that, but we had a whole  
10 group of new initial training candidates, and we have a  
11 shortage of classrooms around here, so we had to delay it  
12 about a week to get it done".

13 The inspector follows up with a training manager  
14 or vice president and says, "I understand that you don't  
15 enough classrooms to conduct your training". And the guy  
16 says, "Yeah, yeah, but we did get money for capital  
17 improvements, it's now out with the architect, and we  
18 expect in 18 months to two years, that we'll have an  
19 addition to our training center and have the classrooms".

20 The inspector goes back and indicates that he  
21 had found that there was an inadequate number of  
22 classrooms. No mention that this had been identified to  
23 him. No mention of the fact that there was a program  
24 under review. So, the finding comes out, inadequate  
25 classroom. Conclusion: Management not paying proper

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 attention to the operational needs of the plant, something  
2 to that effect.

3 So, that goes out. The licensee then has to  
4 spend some resources in responding to that, basically,  
5 saying what was told to the inspector, and it has to go  
6 through the review in their organization, through many  
7 favored channels, making sure that the answer is correct.  
8 Comes to the NRC, we go through the same process, and it  
9 ends up the NRC says closed out, so no harm.

10 But when you take this, one, I think the fact  
11 that it was not mentioned -- would have not been mentioned  
12 that this was identified by the licensee and there was a  
13 program under review or underway -- professionally and  
14 ethically, I question. It might make the inspector look  
15 like he did a good job, he uncovered something, and so  
16 forth.

17 But if you add all these up, and then the  
18 question of -- and I'm not questioning this and whether  
19 it's related to safety -- but that there are a number of  
20 things that people say "we can't find how it relates to  
21 our regulations, and we can't see how it really directly  
22 affects public health and safety", you add these up,  
23 people responding, and then the NRC saying, well, closed  
24 out, they are satisfied with the answer, is just  
25 expenditure of effort.

NEAL F. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1           My question to you is, what do you do to make  
2           sure that these findings and recommendations do relate to  
3           regulatory requirements, are professionally presented --  
4           in other words, giving credit where they were told these  
5           things, identify programs under review, and so forth, and  
6           that they do have some bearing on public health and safety  
7           rather than an observation. It might even be a good  
8           recommendation. In fact, I think in every case that  
9           people have made these comments, they say "we welcome good  
10          recommendations from anywhere", but when we have to  
11          respond on things that we already told the people when  
12          they were here, and we don't see the direct relationship  
13          to health and safety, why do we have to spend all this  
14          time answering these things, then the NRC reviewing them  
15          and saying, well, closed out.

16                 So, my question, what do we do in the diagnostic  
17          evaluation, to make sure that we're on target with our  
18          mission?

19                 MR. JORDAN: Okay. The example you gave as an  
20          illustrative example would bother me a great deal because  
21          that's exactly what we don't want to do. We don't  
22          encumber the utility with nits and trivia. And, so, the  
23          whole purpose of the diagnostic is to get an understanding  
24          of what the actual safety performance at a particular  
25          plant is, and do it independently of the normal program.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1           We find out what the region has done. We find  
2           out what NRR has done. And the team is composed of people  
3           that have not previously reviewed that site, been directly  
4           involved with the regulation of that site, not from the  
5           region, in fact, and so are there to get an understanding  
6           of that plant's status.

7           And the first thing that the team is directed to  
8           do is to understand what the utility's plans are, and most  
9           of these plants, as you indicate, have a corrective  
10          action, a get-well plan, already structured and perhaps  
11          ongoing. And we don't want to interrupt that, we want to  
12          take advantage of it. But we do want to understand  
13          whether or not it's the right plan, whether it does have  
14          the right elements in it.

15          And, so, we're trying to get a much bigger  
16          picture than that. We want to know fundamentally why  
17          things aren't going well or, if they are going well, why  
18          they are. And, so, the example would be foreign to what  
19          I expect. We do use senior managers from the staff, the  
20          regional division director level, as team leaders. Lee  
21          Spessard has led some of those teams. And maybe he's the  
22          one that had the detailed findings.

23               MR. SPESSARD: I doubt it.

24               COMMISSIONER REMICK: Are you saying that there  
25          are not findings and recommendations that can relate back

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to our regulatory requirements?

2 MR. JORDAN: Let me get to what may be the  
3 problem. Up until, I guess, about two or three years ago,  
4 the diagnostics carried forward all of the findings. The  
5 individuals wrote everything they found, and then in the  
6 summary and in the issues, only those higher level issues  
7 were then conveyed to the utility.

8 What we didn't realize was that the utility was  
9 then individually keeping book on those lower level  
10 findings as well, and the region was in their follow-up.  
11 And, so, we had burdened both the region and the utility  
12 with nits that didn't really affect safety.

13 COMMISSIONER REMICK: That was another point  
14 I've heard, it needs to track all these things which were  
15 uncovered.

16 MR. SPESSARD: We stopped that.

17 MR. JORDAN: Right. We stopped that.

18 COMMISSIONER REMICK: How recently?

19 MR. SPESSARD: Palo Verde was the last large  
20 size report that was issued, and from Zion forward we've  
21 had a shorter version.

22 MR. TAYLOR: Rightfully so, I think the licensee  
23 told us about it, and we tried to fix that. That was a  
24 useless exercise in some of the trivia that came out in  
25 the report.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. SPESSARD: Can I just add something?

2 MR. JORDAN: Yes. We thought we had burdened  
3 the region with follow-up that we didn't intend even.

4 MR. SPESSARD: I'd like to add that every team  
5 that goes out is trained before they go, what the  
6 expectations are of that team. They get a lecture from  
7 me, and Ed Jordan as well. We emphasize strengths and  
8 weaknesses when we see them. If the licensee has programs  
9 in place, the instructions given is, you'll assess that  
10 program and give them credit where credit is due. It's  
11 intended to be an objective evaluation -- in other words,  
12 it's balanced. It's not skewed one way or the other. But  
13 you report what you find and, if it's mostly negative,  
14 then the report is going to be negative. So, we have made  
15 some adjustments. But I will be honest, our evaluation is  
16 intended to be performance-based. It's intended to look  
17 at performance as it relates to safety, not necessarily  
18 regulations, and that has some licensees upset, but we're  
19 strictly interested in performance as it relates to  
20 safety.

21 COMMISSIONER REMICK: Is it easier to relate it  
22 to "safety" than it is regulatory requirements because, of  
23 course, almost anything one does in a plant, one could say  
24 somehow affects safety, but how significant is it?

25 MR. SPESSARD: The difference --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. JORDAN: I can respond and say what we were  
2 trying to do was to avoid making diagnostic a civil  
3 penalty hunt --

4 MR. SPESSARD: Or to read like an inspection  
5 report.

6 COMMISSIONER REMICK: Yes, I understand.

7 MR. JORDAN: So that it doesn't have the list of  
8 "contrary to's" and that kind of a regulatory form.

9 COMMISSIONER REMICK: That makes sense. Yeah.  
10 Well, I urge that you look very closely at those. It  
11 appears that you are reducing some of that trivia that  
12 I've heard comments about, and the extensive effort it  
13 takes then to close out things that should not have been  
14 necessary to close out, that they were basically closed  
15 out when the discussion -- I realize there could be  
16 differences there, but I'd urge you to continue to look  
17 very closely at those.

18 MR. JORDAN: Thank you.

19 MR. SPESSARD: If you used a real example, I'm  
20 totally unfamiliar with it.

21 COMMISSIONER REMICK: No, it was not a real  
22 example.

23 MR. TAYLOR: But there was some of them that we  
24 had that problem.

25 MR. JORDAN: We had that problem, I agree.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 I think the last thing I would like to talk  
2 about is the follow-up of recommendations, and could I  
3 have slide 22, please. (Slide)

4 And I'll use that as a typical of what we do for  
5 both incident investigations diagnostics and case studies.  
6 Where we compile and maintain a status of the  
7 recommendations, and these are recommendations that were  
8 transmitted from the EDO's office to the Program Office  
9 or, in the case of case studies, recommendations I made to  
10 the Program Office, that we track and verify on an annual  
11 basis that we maintain the status.

12 Thus far, there have been something like 32 case  
13 studies conducted, that had 120 recommendations, and there  
14 are of the order of 15 remaining. Some of these have been  
15 partially closed out since these numbers were generated.

16 And, so, once again, from my perspective, we  
17 haven't accomplished anything until we have conveyed a  
18 lesson and, in fact, the lesson has taken. And I think  
19 one of the things we've learned over the last few years is  
20 that it is becoming more important for us to look harder  
21 at how well those lessons have taken because some of them  
22 are a fraction, that some utilities did it, some didn't,  
23 some utilities did better than others and, of course, even  
24 within the NRC, we ourselves learn lessons that don't  
25 stick, and we have to just keep working at them.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1           Could I have the last slide, please. (Slide)

2           In summary, our role is to provide the  
3 independent review and assessment of licensee safety  
4 performance and, in doing so, we expect to reduce the  
5 likelihood that a safety lesson will remain unlearned, or  
6 that a safety lesson would become unraveled.

7           We provide some redundancy, diversity, and a Q-A  
8 role -- and I left off of my summary slide -- we provide  
9 appropriate feedback of experience both to the agency and  
10 to the industry.

11           Our reviews complement the assessments done by  
12 the Program Offices. We try not to duplicate -- I mean,  
13 if the Program Office is doing a particular activity, we  
14 don't replicate that activity. We are responsible for  
15 closing out our recommendations and, once again, to make  
16 the last point, we have to continually review the  
17 corrective actions, to assure that the lessons have a  
18 permanence or, if the lesson is changed slightly, that it  
19 be re-established. That's all I had prepared.

20           CHAIRMAN SELIN: Mr. Jordan, as you well know,  
21 I'm very pleased in general with the operation of the  
22 office, and even more so with the concept that having a  
23 group that's relatively independent, that can look at the  
24 empirical results without being so wrapped up with the  
25 arguments about why we did this or that in the first

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 place, is invaluable. And I'm struck, even though  
2 occasionally we do need the help of outsiders to point out  
3 questions such as the thermal-add question, or the boiling  
4 water reactor level indicator question that perhaps hasn't  
5 gotten as much attention within the agency, nevertheless,  
6 it is impressive to me, given how complex reactors are and  
7 just how much engineering there is, that so many of these  
8 problems are found by our own efforts and, in large part,  
9 by your office's efforts.

10 I'm equally impressed, but in a negative sense  
11 rather than positive sense, on the material side, such as  
12 the medical side, how often evidence shows up that we just  
13 don't know ourselves, that comes -- and, you know, a  
14 couple of reporters, in a few weeks, can find dozens of  
15 cases of incidents that we really are not aware of, as an  
16 institution, ourselves. And bearing in mind that the  
17 relative effort in reactors versus, say, materials is  
18 quite different, I think that's appropriate.

19 Do you see a potential role for -- I don't want  
20 to call it the "incident investigation", or the  
21 "independent investigation", it's not that formal -- but  
22 a role that you think your organization could play in  
23 providing a certain amount of evaluation so that the  
24 Commission isn't so dependent upon the regulators, to tell  
25 us how they are doing, and would have an independent

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 source of empirical information on some of the material  
2 side? In this case, I'm obviously very much concerned  
3 about the medical side, but I wouldn't limit it to that  
4 question. This is the speculative question I've been  
5 threatening you with for an hour --

6 MR. JORDAN: Yes, sir, I was afraid --

7 CHAIRMAN SELIN: -- in case you hadn't noticed.

8 MR. JORDAN: You're correct, we do a very small  
9 effort in this area. We spend the order of two dedicated  
10 individuals --

11 CHAIRMAN SELIN: Out of how many?

12 MR. JORDAN: Out of 116, sir. We, in fact, have  
13 just made a recent selection, so that those two people,  
14 one will look at the medical side and the other at the  
15 nonmedical side of the entire materials program. And in  
16 that way, they can only look at the tip of the iceberg.  
17 They can only survey some of the statistical information,  
18 and cannot provide true independent review.

19 We are managing for Jim Taylor, the incident  
20 investigation into the oncology services incident, and --

21 CHAIRMAN SELIN: Is this the first medical IIT  
22 that we've done?

23 MR. JORDAN: It's the first medical. We did a  
24 materials, the Amersham lost source event as an incident  
25 investigation, and each of those has identified a large

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 number of lessons. So, I am uncomfortable. I think I  
2 would have to have a discussion with Jim Taylor, and come  
3 back to you as to what we would want to propose.

4 CHAIRMAN SELIN: When you have the discussion,  
5 one other thing I'd like you to think about is -- again,  
6 I realize that performance indicators are based on a huge  
7 basis of corporate experience that we have. We have a lot  
8 of data, we have a lot of people who know a lot of things.  
9 You have SALP scores, you have all kinds of things you can  
10 refer to and say it is plausible. But it seems to me  
11 that, particularly in the medical area, that we sorely  
12 need some kind of overall performance indicators to really  
13 say, you know, how's the industry doing? How are we  
14 doing? Are we spending all this time worrying about the  
15 one event in a million that is bound to slip through where  
16 humans are practicing medicine, or do we have a serious  
17 problem that we've been sort of overlooking in a lot of  
18 quality assurance data?

19 So, it's not just whether we can do the  
20 specifics, which I think is the more important of the two,  
21 but whether we can have some way of measuring relatively  
22 objectively, how are we doing? How are our programs  
23 doing? How are the people we regulate doing? Are they  
24 getting better? Are they getting worse? Is the risk  
25 involving nuclear medicine comparable with the risks that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 are involved in other ways of practicing medicine at such  
2 a high level? Is there -- particularly, I'm interested in  
3 is there a big disparity with what happens in the devices  
4 we don't license, like accelerators and x-rays, compared  
5 to the ones that we do license? Are people avoiding using  
6 medical byproducts just because we cause them more  
7 trouble, good or bad, than going to electrical sources of  
8 radiation? There are all kinds of questions that are  
9 really evaluation questions, and I know it's a lot to ask,  
10 but I wonder if there's a role for AEOD and the kind of  
11 evaluations you do, at least getting a little bit of a  
12 start on these very troublesome questions.

13 MR. TAYLOR: Mr. Chairman, I'd like to come back  
14 to you. There are a couple of sets of information, those  
15 are in states in which we have jurisdiction and those in  
16 the agreement states, where -- the division of the 29  
17 agreement states where they oversee the medical aspects.  
18 So, there are several different sets of data and  
19 information, but to your broader question, I think we need  
20 to -- Jordan and I need a little time to work through that  
21 and see how much effort we're able to do within the  
22 current resources, but the absence of the information is  
23 very evident.

24 CHAIRMAN SELIN: It may be quite premature, but  
25 this approach of looking at the data and not getting

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 involved in what was it we were trying to do in all the  
2 defense of this stuff is so powerful, and you've really  
3 done it very well.

4 Commissioner de Planque, you haven't had a  
5 chance --

6 COMMISSIONER de PLANQUE: Just one more comment  
7 along those lines, it always strikes me as interesting  
8 that in the report we send to Congress, there's a fair  
9 number of nonreactor incidents that go in there. And if  
10 you look at the balance in that report, reactor versus  
11 nonreactor, then you have to wonder about is the balance  
12 here consistent with that?

13 MR. JORDAN: Yes.

14 MR. TAYLOR: That's right.

15 COMMISSIONER de PLANQUE: And in view of the  
16 fact that it's not, what's wrong? Which one is out of  
17 balance?

18 MR. TAYLOR: Reasonable question, it's been  
19 asked a number of times through the years. It's a  
20 reasonable question.

21 COMMISSIONER de PLANQUE: Yes. A couple of  
22 questions. We haven't touched at all on what goes on in  
23 a similar way in the international arena. Are we getting  
24 events reports from the international community, and how  
25 helpful are they in your efforts?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. JORDAN: Yes, and, Jack, why don't you  
2 answer that with the IRS.

3 MR. ROSENTHAL: Well, we formally reviewed the  
4 International Reporting System reports, and incorporate  
5 them into our own products. We have a lot of data  
6 ourselves, so you have to question how useful they are.  
7 But we are also involved in rare event analysis. An  
8 example, on the slide there was power oscillation at a  
9 boiling water reactor. And at the time, we knew of only  
10 one in the United States, but there were two other events  
11 that had been reported internationally, and that was a  
12 deciding factor in whether to go forward or not, and we  
13 had written it up in the report.

14 So, although it's far less data, it's usually at  
15 a higher threshold than the 2,000 LERs a year that we get.  
16 So, we do find it a valuable source.

17 COMMISSIONER de PLANQUE: Okay. Also, in the  
18 international arena, do regulatory bodies in other  
19 countries have a group similar to yours and, if so,  
20 anything to learn from that?

21 MR. ROSENTHAL: Yes, but different. My  
22 equivalent in Germany is GRS, who really are not feds.  
23 France has a very similar group.

24 COMMISSIONER de PLANQUE: Is there much  
25 interaction?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS  
1323 RHODE ISLAND AVENUE, N.W.  
WASHINGTON, D.C. 20005

1 MR. ROSENTHAL: Yes. Yes.

2 COMMISSIONER de PLANQUE: Okay. Based on your  
3 independent experience, would you like to offer some  
4 comments on SALP, whether you think there should be any  
5 changes?

6 MR. JORDAN: I think SALP is a very valuable,  
7 beneficial tool, and the early correlations we made in  
8 validating performance indicators reinforced that view.  
9 So, I'm a supporter of SALP.

10 COMMISSIONER de PLANQUE: As it's currently  
11 structured?

12 MR. JORDAN: Yes.

13 COMMISSIONER de PLANQUE: Okay. In the  
14 diagnostic evaluation areas, I had the impression that  
15 this often confirms the notion of poor performance. There  
16 are exceptions, of course. Is there any way to better use  
17 this -- and you were touching upon this, too -- in more of  
18 a predictive mode?

19 MR. JORDAN: It's expensive. We spend two to  
20 two and a half full-term equivalents in doing a  
21 diagnostic. And we did one at a plant that was not a  
22 serious question, as a calibration early on, and we have  
23 gotten some good news from diagnostics.

24 COMMISSIONER de PLANQUE: Yes, I know.

25 MR. TAYLOR: We've found it's better than we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 really might have thought, when we've done them, which is  
2 also good. That is, we came out with --

3 CHAIRMAN SELIN: If I might just break in on --

4 COMMISSIONER de PLANQUE: Go ahead.

5 CHAIRMAN SELIN: What I would hope you would do,  
6 when you do this overall regulatory review that you've  
7 proposed, that you take a look at how the resources that  
8 we apply to plants is correlated with the perceived  
9 performance of the plants -- obviously, the DETs as well  
10 as the team inspections -- would be very high up on the  
11 list of where do these go. I mean, the idea of doing a  
12 two-stage process where you first sort of look for what a  
13 lawyer would call "probable cause", and then put the  
14 resources in where there is rather than just randomly, is  
15 clearly an interesting prospect to look at, and I would  
16 hope you would include the DETs as well as the team  
17 inspections as being the very large discretionary  
18 activities that we do.

19 COMMISSIONER de PLANQUE: That's all I have.  
20 Thank you.

21 CHAIRMAN SELIN: Commissioner Roberts?

22 COMMISSIONER ROGERS: Yeah. Well, just while  
23 we're on the performance indicator question, and somewhat  
24 along the lines of Commissioner de Planque's question, a  
25 couple of years ago, you were attempting to develop a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 leading indicator, and I know that that looked promising  
2 for a while, and there were some enthusiastic reports to  
3 us, and then it just sort of petered away and we haven't  
4 heard anything more about it. And have you totally  
5 abandoned that approach, or that attempt to find a leading  
6 indicator, something that tells you in advance that the  
7 plant is going to get into some trouble?

8 MR. JORDAN: Yes. I give up.

9 COMMISSIONER ROGERS: Give up.

10 (Laughter.)

11 CHAIRMAN SELIN: As Yogi Berra likes to say,  
12 "It's hard to make predictions, especially of the future".

13 COMMISSIONER ROGERS: Right.

14 MR. JORDAN: No. Being maybe a little more  
15 direct --

16 COMMISSIONER ROGERS: I think that was very  
17 direct.

18 (Laughter.)

19 MR. JORDAN: Well, it's not --

20 COMMISSIONER ROGERS: It couldn't be much more.

21 MR. JORDAN: We certainly see the trends in  
22 various information, as being perhaps predictive that  
23 things are getting worse, but in finding some unique  
24 feature of the plant that we can measure that predicts  
25 plants are going to get worse, I don't -- I give up.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 COMMISSIONER ROGERS: Well, it seems as if it's  
2 a quest for something that's very difficult to find.

3 MR. JORDAN: Yes.

4 COMMISSIONER ROGERS: Yes. I noticed in your  
5 discussion you mentioned that you have a daily interaction  
6 with NRR. No mention of any periodic interaction with  
7 NMSS, certainly not daily, maybe not weekly, maybe not  
8 monthly, but I suspect that seems to be on an ad hoc  
9 basis, when you get to NMSS. And my observation relates  
10 somewhat to this question of how we're following the  
11 incidents in the medical area -- we're hearing so much  
12 about that right now, just currently -- and whether we're  
13 following up medical misadministrations in the same way we  
14 would follow up some kind of a problem that's been  
15 discovered in a nuclear power plant.

16 MR. JORDAN: Right. Resource-wise, we clearly  
17 are not. We do have a coordination meeting with NMSS on  
18 occasion, not as often as a periodic one with NRR. When  
19 there is an event call related to materials, we do share  
20 and participate in the call with NMSS. The frequency of  
21 their events that make a telephone notification is much,  
22 much lower than reactors, so they are not a part of a  
23 morning call. They do receive, of course, the daily  
24 report information, but I think a good point has been  
25 raised. They are treated differently. The nonreactor and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 reactor areas are getting a different ratio of effort.

2 Now, I'd like to correct maybe a number I gave  
3 you of 2 to 116 as being more like 2 to the order of 50,  
4 since another part of our office is training and  
5 operations center, and so that wasn't really a fair ratio,  
6 but it's still obviously a large difference.

7 COMMISSIONER ROGERS: Well, it just seems to me  
8 that maybe the general question of how we're following  
9 through longitudinally on the areas of medical and  
10 materials problems maybe is something that merits more  
11 attention.

12 CHAIRMAN SELIN: Anything, Commissioner?

13 COMMISSIONER de PLANQUE: No.

14 CHAIRMAN SELIN: Commissioner Remick?

15 COMMISSIONER REMICK: No further questions, but  
16 I would say that I think it was a good decision some years  
17 ago to set AEOD up in a semi-independent role. I  
18 personally take a lot of comfort from the fact that you  
19 are out there doing the job that you are, and it's been a  
20 pleasure for me to observe the last decade, a little bit  
21 more, what I see not only as an improvement, but a better  
22 job all around, really knowing now what you are about and  
23 so forth. So, I think the AEOD has come a long way from  
24 those very early days when it was trying to find itself in  
25 the organization, and I think you're making a real

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 contribution.

2 MR. JORDAN: Thank you.

3 CHAIRMAN SELIN: I like your Dragnet phrase,  
4 "Just the facts, man, just the facts". I mean, the fact  
5 that you're so far from the policy and you're really just  
6 looking at what's really happening is a great source of  
7 comfort. Thank you very much.

8 MR. JORDAN: We'll be pleased when we are next  
9 door to you.

10 CHAIRMAN SELIN: Yes.

11 (Whereupon, at 11:30 a.m., the meeting was  
12 adjourned.)

CERTIFICATE OF TRANSCRIBER

This is to certify that the attached events of a meeting  
of the United States Nuclear Regulatory Commission entitled:

TITLE OF MEETING: BRIEFING ON ROLE OF AEOD IN OVERSIGHT  
OF OPERATING REACTORS

PLACE OF MEETING: ROCKVILLE, MARYLAND

DATE OF MEETING: DECEMBER 17, 1992

were transcribed by me. I further certify that said transcription  
is accurate and complete, to the best of my ability, and that the  
transcript is a true and accurate record of the foregoing events.

## OUTLINE

Operational Experience Assessment

Feedback of Experience

Incident Investigation

Diagnostic Evaluation

Followup of Recommendations

Summary

## OPERATIONAL EXPERIENCE ASSESSMENT

- Events Analysis
- Accident Sequence Precursors
- Human Performance
- Trends and Patterns
- Performance Indicators
- Abnormal Occurrences

## EVENTS ANALYSIS

- Event Report Screening
- Daily Events Conference Call
- Classify LER Significance
- Initiate Engineering Study
- Initiate Human Performance Study
- Perform ASP Analysis

## ACCIDENT SEQUENCE PRECURSOR PROGRAM

- Systematic Risk-Based Evaluation
- Estimates Conditional Core Damage Probability
- Discovers Plant Vulnerabilities
- Failures Not Always In PRAs
- Identifies Important Events

## HUMAN PERFORMANCE STUDIES

- Case Study AEOD/C92-01, "Human Performance in Operating Events"
- Information Provided
  - Control Room Staffing, Organization
  - "Dual Role" Shift Technical Advisor
  - Shift Resources, Crew Teamwork
  - Task Awareness, Use Of Procedures
  - Human-Machine Interface

## TRENDS AND PATTERNS

- Analysis of Operational Events & Conditions
- Development of Tools and Procedures
- Develop Trends for
  - Hardware-Related Items
  - Human Performance
  - Regulatory & Safety Issues
  - Industry Initiatives
- Assess Risk Significance of Trends

## PERFORMANCE INDICATORS

- One of Several NRC Management Tools
- Plant Performance Analysis
  - Identify Performance Trends
  - Identify Performance Strengths/Weaknesses
- Industry Performance Trends

## ABNORMAL OCCURRENCE REPORT

- Identification of Proposed Abnormal Occurrences
- Coordinate with Program Offices and Regions
- Quarterly Issuance
- Develop Criteria and Prepare Guidance

## FEEDBACK OF EXPERIENCE

- Air Systems - Generic Letter 88-14
- BWR Power Oscillation - Bulletin 88-07
- Service Water - Generic Letter 89-13
- Motor-Operated Valves - Generic Letter 89-10
- Solenoid Operated Valves - Generic Letter 91-15
- Pressure Locking of Gate Valves

## PRESSURE LOCKING OF GATE VALVES

- Safety Issue: Potential Common Mode Failure to Open Important Valves
- Phenomena: Valve Motor Operator Cannot Overcome High Loads
- Cause: Bonnet Pressurization Locks Gate Valve Closed

## PRESSURE LOCKING OF GATE VALVES

- AEOD May 1992 Site Survey Results
- Pressure Locking a Credible Problem
- Plant-Specific Failure Experience Lacking
- Engineering Analyses of Phenomena Not Conservative or Complete
- Most Licensees Have Not Implemented Recommended Valve Modifications

## PRESSURE LOCKING OF GATE VALVES

- NRC Circular 77-05, 1977
- W Service Letter, 1977
- AEOD Pressure Locking Study, 1984
- Industry Feedback, 1984
- Recent LERs Show Problem Continues to Exist
- NRC Information Notice 92-26, 1992
- AEOD Special Study, December 1992

## INCIDENT INVESTIGATION PROGRAM

### PURPOSE OF IIP

- Investigate Serious Operational Events
- Full Understanding of the Issues
- Increase Effectiveness of NRC Programs

## INCIDENT INVESTIGATION PROGRAM

### AEOD'S ROLE

- Maintain Documentation and Provide Training
- Evaluate and Recommend Events for IITs
- Propose IIT Charter and Members
- Provide IIT Administrative Support
- Review Draft IIT Report for Completeness
- Propose NRC Actions and Monitor Status
- Document Action Closeout in Annual Report

## INCIDENT INVESTIGATION PROGRAM

### EXAMPLES OF TECHNICAL LESSONS

- Shutdown Risk Management Issues
- AFW Turbine Overspeed Trip Deficiencies
- MOV Switch Setpoint Problems
- Check Valve Reliability Issues
- Fuel Facility Criticality Safety Control Issues

## INCIDENT INVESTIGATION PROGRAM

### EXAMPLES OF REGULATORY LESSONS

- MOV Testing and Surveillance Requirements
- Event Classification and Reporting Requirements for Loss of Criticality Safety Controls
- Shutdown Risk Management Requirements
- Emergency Plan Initiating Event Guidance
- NRC IN/Bulletin Content Guidance

## DIAGNOSTIC EVALUATION PROGRAM

### PURPOSE OF DEP

- Independent Assessment of Performance
- Augment SALP and PI Information
- Determine Root-Causes for Problems

## DIAGNOSTIC EVALUATIONS

### AEOD'S ROLE

- Maintain Program Documents
- Evaluate Performance and Recommend DEs
- Provide DET Core Members
- Prepare DE Plan and Provide Admin Support
- Provide Oversight to DET Manager
- Propose NRC Actions and Monitor Status
- Generic Action Closeout in Annual Report

## DIAGNOSTIC EVALUATION PROGRAM

### COMPLETED DET'S

Dresden - Nov 1987

Arkansas - Dec 1989

McGuire - Mar 1988

Palo Verde - Mar 1990

Turkey Point - Jun 1988

Zion - Sep 1990

Fermi - Nov 1988

Oyster Creek - Feb 1991

Perry - May 1989

FitzPatrick - Dec 1991

Brunswick - Jul 1989

## DIAGNOSTIC EVALUATIONS

### EXAMPLES OF DET LESSONS

- Senior Manager Perspectives on Performance Changed
- Service Water and MOV Deficiencies Identified
- Licensee Improvement Plans Revised
- NRC Staff Reviews of IST Programs Accelerated

## FOLLOWUP OF RECOMMENDATIONS

## SUMMARY OF AEOD ROLE

- Independently Review and Assess Licensee's Safety Performance
- Reduce the Likelihood that a Safety Lesson Will Remain Unlearned
- Reviews Complement Assessments Conducted by Other Program Offices
- Formally Closeout AEOD Recommendations
- Evaluate Adequacy of NRC/Industry Corrective Actions
