Dear Sirs:

The following pages are submitted for your review in compliance with 10CFR§21.21, Report of Defect.

Should you have any questions or concerns in this matter after review of this information, please feel free to contact the undersigned directly.

Sincerely,
NUCLETRON CORPORATION

S.P. Teague
Technical Manager

PART 21

REPORT OF DEFECT

microSelectron-High Dose Rate Remote Afterloader

Abbott Northwestern Hospital

February 4, 1993

Prepared by:

S. P. Teague
Technical Manager
Nucletron Corporation

In compliance with 10CFR§21.21 Nucletron Corporation is submitting the following report with attachments as listed on the Table of Contents Page.

Submitted by:

Stephen P. Teague
Technical Manager
Nucletron Corporation

Date of Report:

February 4, 1993

Facility:

Abbott Northwestern Hospital
850 E. 28th Street
Minneapolis, MN 55407

Device:

microSelectron-HDR S/N 9282
S&D No. MD-497-D-104S

Device Supplier:

Nucletron International B.V.
Waardgelder 1
3905 TH Veenendaal
The Netherlands

Device Installer:

Nucletron Corporation
9160 Red Branch Road
Columbia, MD 21045

Nature of Defect:

See attached

Initial Notification:

- a. By facility 1/6/93
- b. To NRC OPS Center 1/7/93
- c. To Regional Office 1/7/93

Installed Base

See Appendix I (User List 1/93)

Corrective Action Plan:

- a. Action: Replace defective board
- b. Responsible Party: Nucletron Corporation
- c. Time Schedule: Immediate

Final Notification:

- a. to facility 1/7/93
- b. to NRC OPS Center 2/4/93
- c. to Regional Office 1/7/93

Authorization:

This preparation of this report is authorized by the following Corporate Office:

2/4/93
Date

Herbert G. Rice, Jr.
Herbert G. Rice, Jr.
Vice President of Operations

TABLE OF CONTENTS

History of Event

Failure Analysis

Conclusion

Summary

Corrective Action

Appendix I - User List

Appendix II - CPU Board Drawing

History of Event:

January 6, 1993 Nucletron Corporation was advised by telephone by Abbott Northwestern Hospital that a failure of the display circuit on the Control Unit of the microSelectron-HDR occurred. The timer display did not correctly reflect the ongoing treatment. The operator responded appropriately in terminating the treatment at that time and a subsequent attempt to place the unit back into treatment was met with the same failure. The unit was then removed from service. On January 7, 1993, the technical manager and a field service engineer from Nucletron Corporation arrived on site to evaluate the failure and develop a corrective action plan. The investigation started with an interview of the individuals involved in the clinical treatment during which this error occurred. The chronology of events leading up to the failure and operator intervention after the failure was detected was noted and was consistent with previous information given to the vendor.

Failure Analysis

The unit was powered on and successfully completed a Power On Self Test procedure included in the design of the unit. A treatment comparable to the one under which the error occurred was programmed and the unit placed into treatment mode. The treatment was successfully completed without failure. This process was repeated several times and no failures were detected. Examination of the electronic schematics of the device indicated that the situation could occur if the solid state oscillator that drive the Center Processing Unit on the Control Unit were to fail (Appendix II). The microSelectron-HDR contains two identical CPU's, one in the Treatment Unit, and one in the Control Unit. Both were evaluated. The history of the

error as related by the operators could only be duplicated if the oscillator were removed from the circuit of the Control Unit CPU board. The condition was duplicated several times by removing a jumper that connects the clock output to the input of the CPU chip. The oscillator on the CPU board of the Treatment Unit in the shielded room was also tested. An entirely different series of error codes were generated that differed from the operators description of the event. Iterative testing of the board failed to find a consistent failure of the oscillator circuit. However, the failure could be duplicated repeatedly by interrupting the output line from the electronic circuit.

Conclusion:

Intermittant failure of a Center Processing Unit oscillator prevented the operator console display from being continuously updated with treatment times. The CPU in the Treatment Unit continued to perform its design function by treating with appropriate time intervals as programmed. Only the operator display portion of the circuitry was affected. Had the operator not intervened explicitly in this situation the normal treatment for that channel would have been completed and the source retracted to the shielded safe of the unit. An Error Code would have been generated at that time alerting the operator to a failure of the CPU timer.

Summary:

An intermittent failure of a computer clock oscillator caused a timer display to fail to update as designed.

Corrective Action:

Replacement of the affected CPU board resolved the situation and extensive testing demonstrated that the failure would not reoccur. The defective computer board has been removed from service.

As this failure is a single point failure of an individual component on a discrete circuit board, no system wide corrective action is taken by the vendor at this time. This is the first reported instance of this failure in a five year history of this device.

Selectron User List - North/South America
