U.S. Nuclear Regulatory Commission  
Attn: Document Control Desk  
Washington, D.C. 20555

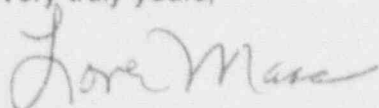

Gentlemen:

**Re: Completion of Follow-up Corrective Actions for Bulletin 91-01 Reportable  
Condition of May 21, 1992 (NRC Report No. 23510)**

On May 21, 1992, Siemens Power Corporation (SPC) reported a criticality safety condition to the NRC Operations Center under NRC Bulletin 91-01. The condition related to the inability of SPC to be able to guarantee moderation control in certain  $UO_2$  powder preparation equipment under all fire fighting scenarios. A 30-day followup report issued to NRC on June 24, 1992, documented immediate corrective actions undertaken by SPC to address this issue as well as a number of longer range actions to be completed in the future.

The purpose of this correspondence is to report the completion of all long term corrective actions identified in the June 24, 1992 report. Documentation addressing the completion of these items was provided to Region V inspection personnel who were onsite at SPC over the week of February 8-12, 1993. If you have questions regarding SPC's responses to this reported condition please contact me on 509-375-8537.

Very truly yours,

Loren Maas, Manager  
Regulatory Compliance
