1.0 AIR QUALITY MODELING

Potential concentrations of radionuclides in air as a result of soil movement activities at the York and Washington facilities were estimated using dust emission and air dispersion models. Potential dust emissions were estimated using models from the U.S. Environmental Protection Agency's (EPA) AP-42 (EPA, 1995). Air dispersion modeling was conducted using the Industrial Source Couple 3 Short-Term (ISCST3) model. The following sections briefly describe these models, why they were chosen, and the details of the analyses for this project. ISCST3 was used to estimate air concentrations at various receptor locations.

1.1 AP-42 MODELING

Three activities related to soil disturbance were evaluated for potential dust emissions: (1) Loading of dump trucks at the York facility; (2) dumping of soil at the Washington facility; and (3) grading of soil at the Washington facility. The following sections describe the modeling of these activities.

1.1.1 Truck Loading at York

Potential dust emissions from loading of dump trucks at the York facility were evaluated using the AP-42 (Section 13.2.4.3)emission factor equation for loading of aggregate onto storage piles via batch drop operation (batch drop equation). The following equation was used:

$$E = k\,(0.0032)\,\frac{(U/5)^{1.3}}{(M/2)^{1.4}}$$

where:

E	=	emission factor (lb dust/ton aggregate handled)
k	=	particle size multiplier (dimensionless)
U	=	mean wind speed [miles per hour (mph)]
M	=	material moisture content (%)

A particle size multiplier (k) of 0.11 was used because the issue of interest is radiation doses due to inhalation and this value of k presents particles with aerodynamic diameters of less than 2.5 μm. The input parameters and resulting emissions estimates are presented in Table 1 in Attachment 1. The estimated dust emission factor is 2.4×10^{-5} lb/ton. This was converted to units of lb/hr based on the following assumptions:

14	cubic yards (CY) soil/truck load
110	lb cubic ft (ft^3) of soil
27	ft^3/CY
2,000	lb/ton
1	truck load/hr

This conversions results in an emission factor of 5.1×10^{-4} lb/hr.

1.1.2 Truck Dumping at Washington

Potential dust emissions from dumping soil at the Washington facility were evaluated using the same AP-42 batch drop equation as we used above for loading the truck. The input parameters and resulting emissions estimates are presented in Attachment 5 of the December 19 document in the table entitled "Estimated Air Emissions from Dumping and Spreading of Soil." See Response to Comment 5 in the December 19 document entitled "Response to U.S. NRC Request for Additional Information" (December 19 document) for a discussion of AP-42 emission modeling results for truck dumping at Washington.

1.1.3 Grading at Washington

Potential dust emissions from grading soil at the Washington facility ware evaluated using the AP-42 (Section 11.9.2) emission factor equation for grading operations. this emission factor equation was derived based on observations at Western U.S. surface coal mining operations. The following equation was used:

$$E = 0.031 * 0.040 * S^{2.5}$$

where:

E = emission factor [lb dust/vehicle mile travelled (VMT)]
S = mean vehicle speed (mph)

The estimated emission factor in units of lb/VMT was converted into units of lb/hr based on the following assumptions:

24 feet per pass with grader
16 passes/truck load
1 truck load/hour

The input parameters and resulting emissions estimates are presented in Attachment 5 of the December 19 Document in the table entitled "Estimated Air Emissions from Dumping and Spreading of Soil." See Response to Comment 5 in the December 19 document for a discussion of AP-42 emission modelling results for truck dumping at Washington.

1.2 ISCST3 MODELING DESCRIPTION

The ISC3 model is a steady-state Gaussian plume model which can be used to asses pollutant concentrations from a wide variety of sources associated with an industrial source complex. This model can account for the following: settling and dry deposition of particles; downwash; area, line and volume sources; plume rise as a function of downwind distance; separation of point sources; and limed terrain adjustment. It operates in both long-term (ISCLT3) and short-term (ISCST3) modes (the latter was used here).

ISCST3 is appropriate for the following applications:

- industrial source complexes;

- rural or urban areas;
- flat or rolling terrain;
- transport distances less than 50 kilometers;
- 1-hour to annual averaging times; and
- continuous toxic air emissions.

ISCST3 was chosen because it allows for sources that vary with time. Concentrations were calculated for one-hour averaging times. The elevation of the sources and receptors was accounted for, as was their height above ground.

1.2.1 ISCST3 Modelling for York

Meteorological data from two sources were used. Surface data from the Capital City Airport in Harrisburg were combined with upper air data from the Greater Pittsburgh International Airport for input into the model. These stations were chosen as they were the closest representative stations for which data were available. (Atlantic City is a closer upper-air station, but is in a maritime climate. Pittsburgh is more representative of York.)

It was assumed that emission rates, though developed for time periods less than an hour (see Table 1 for characteristics of activities), occur for an entire hour, as ISCST3 does not allow for time increments of less than an hour. It was further assumed that the time required to load a truck was less than one hour (30 minutes), and no more than one truck was loaded per hour.

There were seven sectors at the York facility that contained soil concentrations greater than 10 pCi/g. Five of the sectors were roughly circular and approximately fifty feet in diameter. Two of the sectors were larger and were subdivided. One sector near the center of the northern edge was broken into two sectors, and the large sector that dominates the eastern half of the facility was broken into nine smaller sectors. These sectors are depicted in Figure 1 in Attachment 1.

Emissions from truck loading in these sectors were modeled by using area sources, one in the center of each of the 16 sectors, that represented the bed of the truck carrying the soil. That is, each sector was modeled with an area source of two meters by three meters, with a release height of two meters, placed at the center of the sector.

Receptors were placed around the work areas (sectors) and on the fence-line. Specifically, eight receptors were modeled within each work area. Two receptors (one at a 2 meter flagpole height and one at a 3 meter flagpole height) were modeled at four locations placed 10 meters northeast, northwest, southwest, and southeast of the source. Four of the eight receptors were modelled at two meter flagpole heights to represent potential workers standing on the ground surface. The remaining four receptors in each work area were modeled at three meter heights to represent potential workers who would be operating equipment (i.e., trucks or backhoes). There were 36 fence-line receptors, placed at ten degree intervals around the facility. Attachment 2 contains the ISCST3 input parameters and a summary table of the air modelling output and Attachment 3 disks containing the model input and output.

Table 1 presents the results of the ISCST3 modeling run in terms of the modeled dilution factors, [i.e., the estimated air concentration (in units of $\mu g/m^3$) per unit emission rate (in units of lb/hr)]. The dilution factors listed in Table 1 represent the average and maximum estimated at the worker and fenceline receptors locations discussed above. The input parameters and resulting output for all receptor locations are presented in Attachments 2 and 3. These dilution factors are then multiplied by the emissions factors discussed above for truck loading at the York facility (5.1×10^{-4} lb/hr) to yield estimated average and maximum dust concentrations (in units of $\mu g/m^3$). The resulting dust concentrations are then multiplied by the average concentration of radionuclides in soil at the York facility [27 picoCuriesi/gram (pCi/g)], and converted to units of μCi/milliliter (μCi/ml). Table 1 presented the resulting estimated radionuclide concentrations in air in the work area and at the fenceline.

1.2.2 ISCST3 Modelling for Washington

See Response to Comment 5 in the December 19 document for a discussion of ISCST3 modelling for Washington. Attachment 2 contains hard copies of the ISCST3 input and output and Attachment 3 disks with the model input and output.

ICF KAISER

Worldwide Excellence in Meeting Client Needs

2.0 COMPREHENSIVE RADIOLOGICAL DOSE ASSESSMENT

The estimated on-site and fenceline air concentrations of radionuclides for activities at the York facility (Table 1) were evaluated to determine if monitoring of potential emissions is required. A dose assessment was performed in accordance with 10 CFR Part 20. In addition, the dose calculations for York were integrated with the dose calculations presented previously (ICF Kaiser, 1996) for the Washington facility, as one of the potential receptors (the truck driver) is potentially exposed at both locations. Therefore, this addendum represents a compilation of the dose assessment calculations for the entire project.

A governing assumption in this dose assessment is that thorium-232 in soil at York is in equilibrium with its daughters.

2.1 EXPOSURE ASSESSMENT

Potential exposure to radionuclides in soil being transferred from York to Washington could occur at three steps in the project: (1) during excavation and loading of soil into trucks at York; (2) during transport of soil from York to Washington; and (3) during dumping and grading of soil at Washington. Six potential receptors were evaluated who could be exposed to radionuclides during these activities: (1) workers involved in excavation and loading of trucks at York; (2) truck drivers transporting soil from York to Washington; (3) workers involved in grading soil at Washington; (4) hypothetical fenceline receptors at York; (5) hypothetical fenceline receptors at Washington; and (6) the nearest potential residential receptor at Washington. Potential exposure pathways to radionuclides during these activities include direct radiation, inhalation of dusts and incidental ingestion of soil. The potential exposure pathways for each receptor are listed in Table 2 in Attachment 1.

Only the excavator and grader receptors have the potential to directly contact soil. Therefore, only these receptors were evaluated for potential ingestion exposure.

The potential doses associated with the above exposure pathways are a function of the frequencies and durations of exposure, which in turn, are a function of the specific activities associated with this project. Table 3 summarizes the details of the excavation, transport and grading aspects of this project that affect the degree of potential exposure to radionuclides.

The potential dose is also a function of the concentration of radionuclides present in the exposure media -- soil and air. The average concentration of thorium in soil being transferred from York to Washington is 27 pCi/g. As indicated in Table 1, the estimated concentration of radionuclides in air at the York facility is 2.2×10^{-16} microCuries per milliliter (μCi/ml). The estimated maximum fenceline concentration is 2.0×10^{-16} μCi/ml. The corresponding estimated maximum concentrations at Washington are 9.3×10^{-15} μCi/ml on-site and 7.0×10^{-15} μCi/ml at the fenceline (see the December 12 document). At both York and Washington, dose calculations presented here are based on the maximum estimated air concentration from Table 1 of this addendum and the table entitled "Estimated Air Emissions from Dumping and Spreading Soils" in Attachment 5 of the December 19 document. In addition, it should be noted that there are no residences at the fenceline at either York or Washington. Therefore, these concentrations represent conservative estimates of potential exposures to residents. The maximum concentration calculated for the nearest resident to the Washington facility is 6.2×10^{-16} μCi/ml (see the December 19 document).

2.2 DOSE CALCULATIONS

Separate dose calculations were performed for the following scenarios: (1) direct radiation to occupational receptors; (2) inhalation of dusts by occupational receptors; (3) incidental ingestion of soil by occupational receptors; (4) inhalation of dusts by fenceline receptors; (5) direct radiation to fenceline receptors; (6) inhalation of dusts by nearest resident receptors (at Washington); and (7) direct radiation to nearest resident receptors (at Washington). The results of these dose calculations are presented in Tables 4 to 11 in Attachment 1 and summarized below.

2.2.1 Direct Radiation to Occupational Receptors

The potential direct radiation doses to occupational receptors were evaluated by comparing the estimated direct dose to the occupational limit of 500 mrem before monitoring is required. Doses were estimated using Adjusted External Dose Equivalents (EDE) for the radionuclides present in soil. Table 4 presents the EDEs (in units of mrem/yr per pCi/g) for the radionuclides of interest from the Federal Guidance Report No. 12, External Exposure to Radionuclides in Air, Water and Soil. These were adjusted to take into account the concentration of thorium in York soil (27 pCi/g) and the abundance of each radionuclide. They were further adjusted to units of mrem/hr since all of the exposure pathways evaluated in this assessment are of relatively short duration (less than 1 hour). The resulting cumulative adjusted EDE for exposure to soil from York is 0.0498 mrem/hr.

The above adjusted EDE was used to calculate potential direct gamma doses associated with exposure to soil during excavation and loading at York and dumping and grading at Washington. To assess the direct dose associated with truck transport from York to Washington, the EDE provided by Foster Wheeler Environmental Corporation (see Attachment 6 of the December 19 document) of 0.0077 mrem/hr was used.

Table 5 presents the results of the direct dose calculations. The EDEs described above (in units of mrem/hr) were multiplied by the estimated total duration of exposure (in hours) for each receptor. The following sections describe the calculations for each receptor.

Excavator. The excavator receptor is assumed to be exposed to direct radiation while excavating soil and loading the dump trucks. Each load is estimated to take 30 min (0.5 hour). An individual is estimated to load 5 trucks per day, resulting in 2.5 hours of exposure per day. An estimated 357 truck loads will be required to transfer all of the soil from York to Washington. At a rate of 5 loads/day, this will take 72 days. Thus, the cumulative duration of exposure for the excavator is 180 (72 × 2.5) hours. At an adjusted EDE 0.0498 mrem/hr, the total direct dose to the excavator is estimated to be 8.96 mrem.

Truck Driver. The truck driver receives a potential direct dose at York, on the road, and at Washington. The direct dose at York was estimated based on a frequency of exposure of 1 per day and duration of exposure of 30 minutes (0.5 hour) per load. Based on 72 days of exposure, the total duration of exposure is 36 (72 × 0.5) hours. The resulting direct dose (based on an adjusted EDE of 0.0498 mrem/hr) is 1.79 mrem. The direct dose while transporting the soil from York to Washington was estimated based on a frequency of exposure of 1 load/day, a duration of exposure of 6 hr/load, and a total of 72 loads, resulting in a cumulative duration of 432 hours. Using an EDE of 0.0077 mrem/hr, the resulting direct dose on the road is 3.33 mrem. The direct dose while dumping the soil at Washington was estimated using the same approach as at York except the duration of each event is 5 minutes (0.0833 hr). The resulting cumulative exposure duration is 6

hours, resulting in a dose (at 0.0498 mrem/hr) of 0.30 mrem. Summing the doses from the three exposure pathways, the cumulative direct radiation dose is estimated to be 5.42 mrem.

Grader Driver. Using the same approach as was used for the excavator, except for the duration of exposure per load (12 minutes versus 30 minutes), the total exposure duration is 72 hours. At an adjusted EDE of 0.0498 mrem/hr, the resulting direct dose is estimated to be 3.59 mrem.

2.2.2 Inhalation by Occupational Receptors

Potential inhalation doses to occupational receptors were evaluated by comparing the estimated radionuclide concentrations in air at York and Washington to Derived Air Concentrations (DACs) from Table 1, Column 3 of 10 CFR 20 Appendix B. Table 6 in Attachment 1 presents the DAC values for the radionuclides of interest as well as the estimated on-site concentration at both York and Washington. An Effective DAC was derived for each location by dividing the estimated on-site total radionuclide concentration by the DAC for each radionuclide and then summing the ratios. The Effective DAC values for York and Washington are 0.000496 and 0.021, respectively.

Potential inhalation doses were then evaluated by multiplying the Effective DAC values by the estimated total duration (in hours) of exposure for each occupational receptor potentially exposed via inhalation. The total duration of exposure for each receptor is the same as was calculated above for direct doses. These calculations are presented in Table 7 in Attachment 1. The resulting doses are expressed in DAC-hr. The cumulative inhalation doses for the three receptors are 0.09 DAC-hr for the excavator, 0.14 DAC-hr for the truck driver, and 1.51 DAC-hr for the grader.

2.2.3 Ingestion by Occupational Receptors

Potential soil ingestion doses were evaluated by comparing an estimate of the amount of radioactivity ingested from York soil to the Allowable Limit on Intake (ALI) for ingestion from Table 1, Column 1 of 10 CFR 20 Appendix B. These ALIs for the radionuclides of interest are presented in Table 8.

The calculation of the amount of soil ingested by the occupational receptors is presented in Table 9 in Attachment 1. Exposure duration was estimated to be 72 days as described previously for direct dose. The estimated soil ingestion rate for these workers is 200 mg/day. However, for each worker, only a fraction of the total day is spent in activities associated with soil from York. For the excavation worker, this fraction is estimated to be 0.3125 based on an estimated total duration of 2.5 hr/day (calculated as described above for direct dose) relative to an 8-hour work day. The corresponding fraction for the grader is 0.125 based on a total exposure duration of 1 hr/day. The resulting soil ingestion rates are 62.5 mg/day for the excavator and 25 mg/day for the grader. The total intake of soil for each worker is, therefore, 4.5 grams (g) and 1.8 g, respectively. At a concentration of 27 pCi/g, the total radionuclide intake is 121.5 pCi for the excavator and 48.6 pCi for the grader. Table 8 presents a comparison of the ingestion ALIs for the radionuclides of interest to these estimated intakes. As indicated estimated intake is a small fraction of the ALI.

2.2.4 Inhalation by Hypothetical Fenceline Receptors

Potential inhalation doses to hypothetical fenceline receptors were evaluated by comparing estimated fenceline concentrations to effluent boundary limits from Table 2, Column 1 of 10 CFR 20 Appendix B. The effluent concentration limits for the radionuclides of interest are presented in Table 8. These effluent limits were then compared to the estimated fenceline air concentrations of total radionuclides at York and Washington, which are also presented in Table 8. The ratio of the estimated

concentration at each location to the effluent limit was calculated. However, because the limit is for an annual exposure and these activities are expected to take place for a relatively short period of time, the comparison was adjusted to account for the less than annual exposure duration (2.5 hr/day × 72 days = 180 hours for York, and 1 hr/day × 72 days = 72 hours for Washington). The resulting ratios were summed.

At York, the estimated fenceline concentration is less than 1 percent of the effluent concentrations (0.0017 times). At Washington, the estimated fenceline concentration of total radionuclides is 1.64 percent of the effluent concentration limits.

2.2.5 Direct Radiation to Hypothetical Fenceline Receptors

Molycorp performed Microshield calculations on a slab of soil to determine the dose rate at the fenceline at Washington (see Table 7 of Attachment C of the February 8, 1996 letter from B.K. Dankmyer, Molycorp, to L.S.Person, NRC). Using a distance of approximately 80 feet to the nearest fence, the annual dose rate was a small fraction of 50 mrem. Note that this assessment was conducted to a point on Molycorp property and thus not accessible to the public. The dose rate at the nearest unrestricted area, as required in 10 CFR 20.1301, would be even lower.

2.2.6 Inhalation by Nearest Resident Receptors

Potential inhalation doses to the nearest resident receptor to the Washington facility were evaluated using the same approach as was used for the fenceline receptors. The results of these calculations are presented in Table 10. As indicated, the estimated air concentration is well below (0.00145 times) the effluent concentration limits.

Potential inhalation doses to the nearest resident receptor at the York facility have not been performed. Based on the estimated fenceline concentrations at York, and the observation that the nearest off-site concentration at Washington was an order of magnitude lower than the highest fenceline concentration at Washington, a similar relationship was expected at York. Thus, off-site modeling is not necessary.

2.2.7 Direct Radiation to Nearest Resident Receptors

Molycorp previously performed Microshield calculations on a slab of soil at Washington to estimate doses at the fenceline and at off-site locations (see Table 7 of Attachment C of the February 8, 1996 letter from B.K. Dankmyer to L.S. Person, NRC). Based on the results of that assessment, the annual dose to the nearest resident, located approximately 680 feet from the proposed Temporary Structure, would be a small fraction of 50 mrem.

2.2.8 Minimizing Exposures

Attachment 4 provides Molycorp's radiation protection policy. Prior to implementing the work, a project-specific Health and Safety Plan will be developed. As discussed in response to Comment 7 in the December 19 document, Molycorp anticipates the use of dust control measures to further reduce the potential for airborne radionuclides. During field activities, a PDM-3 Miniram (or equivalent) will be used to monitor dust conditions. Monitoring of dust will also be conducted at the fixed monitoring locations illustrated in Figure 2 in Attachment 1. Engineering controls, such as misting will be implemented as needed to maintain airborne dust concentrations within acceptable levels. In addition, access to the work area will be strictly controlled.

Section 3

ICF KAISER

Worldwide Excellence in Meeting Client Needs

3.0 CONCLUSIONS

A compilation of the dose calculations and a comparison to applicable limits is presented in Table 11. The comparison indicates that estimated doses to the worker and fenceline receptors are well within acceptable limits. The calculated dose for the nearest residential receptor at Washington is also within acceptable limits. As expected, the dose to the residential receptor is less than at the fenceline.

WASHINGTON ISCST3 INPUT AND OUTPUT

**MODELOPTs: CONC RURAL ELEV FLGPOL DFAULT

*** MODEL SETUP OPTIONS SUMMARY ***

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

-- SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
1. Final Plume Rise.
2. Stack-tip Downwash.
3. Buoyancy-induced Dispersion.
4. Use Calms Processing Routine.
5. Not Use Missing Data Processing Routine.
6. Default Wind Profile Exponents.
7. Default Vertical Potential Temperature Gradients.
8. "Upper Bound" Values for Supersquat Buildings.
9. No Exponential Decay for RURAL Mode

**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: 1-HR

**This Run Includes: 1 Source(s); 1 Source Group(s); and 26 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours

m for Missing Hours
b for Both Calm and Miss. Hours

**Misc. Inputs: Anem. Hgt. (m) = 10.00 ; Decay Coef. = 0.0000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Input Runstream File: DUMP84.DTA ; **Output Print File: DUMP84.LST

**MODELOPTs: CONC RURAL ELEV FLGPOL DFAULT

*** MODEL SETUP OPTIONS SUMMARY ***

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

-- SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
1. Final Plume Rise.
2. Stack-tip Downwash.
3. Buoyancy-induced Dispersion.
4. Use Calms Processing Routine.
5. Not Use Missing Data Processing Routine.
6. Default Wind Profile Exponents.
7. Default Vertical Potential Temperature Gradients.
8. "Upper Bound" Values for Supersquat Buildings.
9. No Exponential Decay for RURAL Mode

**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: 1-HR

**This Run Includes: 1 Source(s); 1 Source Group(s); and 26 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours

m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Anem. Hgt. (m) = 10.00 ; Decay Coef. = 0.0000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Input Runstream File: DUMP84T.DTA ; **Output Print File: DUMP84T.LST

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  --  SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO WET SCAVENGING Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
           1. Final Plume Rise.
           2. Stack-tip Downwash.
           3. Buoyancy-induced Dispersion.
           4. Use Calms Processing Routine.
           5. Not Use Missing Data Processing Routine.
           6. Default Wind Profile Exponents.
           7. Default Vertical Potential Temperature Gradients.
           8. "Upper Bound" Values for Supersquat Buildings.
           9. No Exponential Decay for RURAL Mode
```

```
**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:   1-HR

**This Run Includes:     1 Source(s);      1 Source Group(s); and     26 Receptor(s)

**The Model Assumes A Pollutant Type of:  PM

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
        Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
        Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Anem. Hgt. (m) =    10.00 ;    Decay Coef. =   0.0000     ;    Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  --  SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO WET SCAVENGING Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
          1. Final Plume Rise.
          2. Stack-tip Downwash.
          3. Buoyancy-induced Dispersion.
          4. Use Calms Processing Routine.
          5. Not Use Missing Data Processing Routine.
          6. Default Wind Profile Exponents.
          7. Default Vertical Potential Temperature Gradients.
          8. "Upper Bound" Values for Supersquat Buildings.
          9. No Exponential Decay for RURAL Mode
```

```
**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:   1-HR

**This Run Includes:    1 Source(s);      1 Source Group(s); and     26 Receptor(s)

**The Model Assumes A Pollutant Type of:  PM

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
        Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
        Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Anem. Hgt. (m) =    10.00 ;    Decay Coef. =   0.0000     ;    Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

YORK ISCST3 INPUT AND OUTPUT

**MODELOPTs: CONC RURAL ELEV FLGPOL DFAULT

*** MODEL SETUP OPTIONS SUMMARY ***

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

-- SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
1. Final Plume Rise.
2. Stack-tip Downwash.
3. Buoyancy-induced Dispersion.
4. Use Calms Processing Routine.
5. Not Use Missing Data Processing Routine.
6. Default Wind Profile Exponents.
7. Default Vertical Potential Temperature Gradients.
8. "Upper Bound" Values for Supersquat Buildings.
9. No Exponential Decay for RURAL Mode

**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: 1-HR

**This Run Includes: 1 Source(s); 2 Source Group(s); and 8 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours

```
                                                    m for Missing Hours
                                                    b for Both Calm and Missing Hours

**Misc. Inputs:  Anem. Hgt. (m) =    10.00 ;    Decay Coef. =   0.0000     ;    Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                  ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Input Runstream File: YORK85-4.DTA                          ;  **Output Print File: YORK85-4.LST

*** MODEL SETUP OPTIONS SUMMARY ***

- -

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

-- SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
1. Final Plume Rise.
2. Stack-tip Downwash.
3. Buoyancy-induced Dispersion.
4. Use Calms Processing Routine.
5. Not Use Missing Data Processing Routine.
6. Default Wind Profile Exponents.
7. Default Vertical Potential Temperature Gradients.
8. "Upper Bound" Values for Supersquat Buildings.
9. No Exponential Decay for RURAL Mode

**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: 1-HR

**This Run Includes: 6 Source(s); 6 Source Group(s); and 56 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours

m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Anem. Hgt. (m) = 10.00 ; Decay Coef. = 0.0000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Input Runstream File: york85-2.dta ; **Output Print File: york85-2.lst

**MODELOPTs: CONC RURAL ELEV FLGPOL DFAULT

*** MODEL SETUP OPTIONS SUMMARY ***

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

-- SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses RURAL Dispersion.

**Model Uses Regulatory DEFAULT Options:
1. Final Plume Rise.
2. Stack-tip Downwash.
3. Buoyancy-induced Dispersion.
4. Use Calms Processing Routine.
5. Not Use Missing Data Processing Routine.
6. Default Wind Profile Exponents.
7. Default Vertical Potential Temperature Gradients.
8. "Upper Bound" Values for Supersquat Buildings.
9. No Exponential Decay for RURAL Mode

**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: 1-HR

**This Run Includes: 6 Source(s); 6 Source Group(s); and 56 Receptor(s)

**The Model Assumes A Pollutant Type of: PM

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours

```
                                                    m for Missing Hours
                                                    b for Both Calm and Missing Hours

**Misc. Inputs:  Anem. Hgt. (m) =    10.00 ;    Decay Coef. =   0.0000     ;    Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                 ; Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Input Runstream File: york85-1.dta                          ; **Output Print File: york85-1.lst
```

MOLYCORP RADIATION PROTECTION POLICY

Molycorp, Inc. - Washington, PA

RADIATION SAFETY OFFICER'S OPERATING MANUAL (Updated 1/15/97)

The following items should be checked by the Radiation Safety Officer (RSO) at the frequency suggested.

A PERSONNEL

1. Safety Orientation of all who work with radiation producing equipment and/or radioactive material, who frequent areas in which this equipment or materials are used.

   Frequency: Initially pre-placement, prior to change in type, amount, use of affecting degree of radiation risk.

2. Personnel onitoring (film badges)

   a. Insurance by RSO to all persons who work with radiation producing equipment (x-ray diffraction equipment), and all personnel working in plant area where exposure is possible during decontamination and decommission activities.

   b. Records of results of personnel monitoring are checked and initialled by RSO upon receipt each month: reviewed quarterly - summarized annually.

   c. Exposure Investigation - without delay, RSO attempts to find cause for unusual exposure of personnel monitoring devices documented by employee's written report to be reviewed by RSO together with employee's supervisor, and recommendation made to avoid reoccurrence.

3. Notice to Employee Form NRC-3, and Pa " notice to employees" shall be posted by the RSO at such location that those employees involved with radiation equipment and/or radioactive material will be able to read the document. Check posting quarterly.

4. Personnel Protection: Will be considered in the job specific health and safety plan which will be developed by RSO in conjuction with consultants health physicist and consultant

5. Air Monitoring: will be performed anytime earth moving activities are planned in areas of potential contamination

B. CONTROL OF RADIOACTIVE MATERIALS AND RADIATION PRODUCING EQUIPMENT

1. Procurement RSO shall be notified of all requests for purchase, sale, transfer or disposal of any radioactive materials or any electrical equipment which is known to, or suspected of being capable of producing ionizing radiation. RSO shall immediately check to assure company complies with regulations of US-NRC and Pa. concerning registration and license restrictions. Copies of purchase orders, bills of lading shall be filed with RSO.

2. Posting and Labeling RSO shall monitor all shipments (in and/or out of Molycorp) to assure compliance with US-NRC and US-DOT regulations relative to proper labeling of contents, posting of areas and placarding of vehicle.

3. Radiation Survey

   a. Weekly physical inspection shall be conducted by the RSO of the integrity of the licensed material pile, cover, fence and signs. International Technology Corporation shall conduct a quarterly radiological survey of all areas where radioactive materials are stored. International Technology Corporation shall conduct annual inspection of x-ray equipment. More frequent inspections or surveys shall be performed if personnel monitoring indicates a potential problem. Documentation of all surveys shall be kept on file by RSO.

   b. The RSO shall make certain that exposure to employees and the public shall not exceed current permissable levels and that licensed radioactive materials are stored in accordance with applicable regulations and the conditions of the company's license.

   c. Emergency Survey RSO shall monitor without delay an area suspect of causing or threatening to cause radiation

risk. Results of such surveys shall be recorded and official notification made in accordance with NRC regulations.

4. Health physics instrument, procurement, calibration, and maintenance shall be under the supervision of the RSO and International Technology Corporation It is the RSO's responsibility to maintain a sufficient number of portabl radiation survey instruments in working condition to monitor accuratel (± 10 %) Alpha, beta, and gamma radiation.

   a. Portable survey meters shall be calibrated annually or before use following any repair.

5. Training The RSO shall provide radiation safety orientation for all employees whose jobs may involve working with radiation producing equipment. He will present factual information concerning the nature of the radiation risks and methods of assuring that the control radiation risks and methods are effective. The RSO will also inform employees of the availability of sources of additional pertinent information including the following:

   a. Molycorp Radiological Safety Procedures Manual
   b. NRC regulations

C. RECORDS

1. Radiation Records and files shall be maintained for or by the RSO in an accurate orderly manner, readily available for inspection by authorized federal, state, and company officials. Among those files and records maintained for or by the RSO shall be the following:

   a. Personnel radiation monitoring: Monthly film badge reports.

   b. Radioisotope inventory: (1) shipping and receiving records. (2) source materials.

   c. Radiation survey reports: Quarterly by International Technology Corporation.

   d. Instrument calibrations: portable surbey meters by International Technology Corporation.

e. Training records: (1) employee indoctrination, safety orientation. (2) RSO training.

f. Inspection reports on file: (1) US-NRC. (2) Pa Health Dept. (3) Other.

g. Licenses and registrations: (1) US-NRC source materials. (2) x-ray producing equipment.

h. Regulation: (1) US-NRC Title 10-CFR-30, 32, 33, 34, 35, and 40. (2) US-DOT. (3) Pa regulations.
