COMPLIANCE INQUIRY MEMORANDUM
MALLINCKRODT NUCLEAR, ST. LOUIS, MISSOURI
LICENSE NO. 24-4206-1
REPORT OF EXCESSIVE THYROID BURDEN OF IODINE 131

Ex 6

Reference a letter dated October 20 from subject licensee in which a report is made of a thyroid burden in excess of the recommended average of 0.14 microcuries. The report is made for [REDACTED] for the week of September 17.

This exposure was brought to our attention during a discussion with licensee management on October 17. The measures outlined in the licensee letter of October 20 are among many that have been instituted in order to reduce the probability of additional thyroid burdens. The effectiveness of these steps, as they relate to the licensee's overall thyroid burden problems, will be watched closely during each inspection.

We do not plan any specific action at this time with respect to the report of [REDACTED] excessive thyroid burden.
