COMANCHE PEAK MEETING BETWEEN
NUCLEAR REGULATORY COMMISSION STAFF
AND TEXAS UTILITIES
MOTIONS FOR SUMMARY DISPOSITION

* * *

23 August, 1984

P R O C E E D I N G S

MR. BURWELL: Okay. My name is Spott Burwell. I am the licensing project manager for the Nuclear Regulatory Commission. We are gathered here today for a meeting between the NRC Staff and Texas Utilities to discuss, I believe it's two or three of the Motions for Summary Disposition which Texas Utilities has filed with the board, and I believe these were filed in June or July. The meeting today is open to the public in accordance with our procedure, and there has been a meeting notice issued. I doubt seriously if the parties down here have received it since when I left, why, we were one secretary short and still trying to get the thing in the mail. The meeting notice said that the meeting was open to the public. The meeting notice also stated that there was some possibility that it might be necessary for the members of the staff to go on site with the applicant to look at certain of these pipes and that any members of the public who needed or desired to attend that should make arrangements with the applicant. Now, I am not sure that will be necessary today. In any event, I think we are ready to basically proceed with the first Motion for Summary Disposition, which was a motion filed on June

1 the 17th. This relates to the applicant's motion
2 for summary disposition regarding stability on pipe
3 supports.

4 This discussion on this item is a continuation
5 of a discussion held on August the 8th and August
6 the 9th in Bethesda, meeting again between Texas
7 Utilities and the staff. With that, I turn the
8 opening of the discussion over to Mr. Ippolito.

9 MR. IPPOLITO: As you know, I set up this
10 meeting, and the purpose for me setting up this
11 meeting is that I read the transcripts of the pre-
12 vious meeting, and even though I'm not expert in
13 pipe support design, it was readily apparent to me
14 that we don't seem to be able to converge on the
15 resolutions of two issues. One that Spott just
16 mentioned that I will call stability, and the second
17 issue is generic stiffness, I believe. I felt that
18 both the staff and the applicants have been talking
19 about these two issues for about two or three meet-
20 ings, and I felt that was enough and that something
21 had to be done. We have present here, I think, the
22 people who could make these things happen. I think
23 that this meeting will conclude with a resolution.
24 And as I perceive the resolution, it's going to be
25 as follows:

1 One, let me speak -- I'm going to delay any
2 discussion on generic stiffness until Mr. Fair
3 arrives, he is down at the plant right now. I am
4 focusing now only on the issue of stability. As I
5 see the issue, we will resolve it in one of two or
6 possibly three ways. One is let's take the pipe
7 supports in question and fix them in the tradition-
8 al sense. Two, this is an "or," or provide an anal-
9 ysis -- the applicants to provide an analysis from
10 the responsible design organization. I guess what
11 I mean here is that if Grinnell was the responsible
12 organization, we want it from Grinnell. If Gibbs-
13 Hill was the principal design organization, then we
14 want it from -- okay? And then as you would guess,
15 these analyses must address all of the uncertainties,
16 all of the appropriate uncertainties. And the third
17 option is, and it's an option to you, you could do
18 both.

19 Now, I believe we're prepared to identify the
20 types of supports that we're talking about, and that
21 will help us focus on what we are talking about.
22 And I guess we leave it up to the applicant in dis-
23 cussion as to how to proceed from that point.

24 MR. VOLLMER: One element in that would be
25 preceding those options, we would want you to

1 establish a program and tell us what that program is,
2 too, for you to go out and identify those supports
3 in the plant which would fall under the criteria
4 that we're giving. So it would be your responsi-
5 bility to go out and identify where they are and
6 what needs to be done either the fixing or the
7 analysis. Okay. Dave, why don't you --

8 MR. FIKAR: Let me just make some remarks.
9 Tom, you made my opening remark awhile ago.

10 Obviously, we have been at this a long time.
11 We started filing these summary motions three months
12 ago, and we finally got them all. We haven't got
13 any of your responses. We're going to be ready to
14 load fuel here in the early part of October. The
15 hatch will be closed this weekend, and we're ready
16 and willing if you will specify just exactly what
17 you want us to do. We've got the resources here to
18 do it, so I'm right on with your approach, Tom, and
19 hopefully, while we're here today, tomorrow, or how-
20 ever long that takes, we'll have resolved this thing.
21 I suggest you be specific and stay with the motions
22 that were filed and not generate any new ones. That
23 always helps speed up things. Narrow the issues
24 rather than, as you pointed out, we need to work
25 towards some conclusion rather than a divergent set

1 of questions or so forth. With that, we are here,
2 have at us.

3 MR. TERAQ: I think one of the major problems
4 we had from the August 8th and 9th meeting as be-
5 tween the staff and the applicant is that we never
6 completely agreed on the definition of unstable
7 pipe supports. I believe we reached some under-
8 standing in concurrence on instability of piping
9 systems, but when it came to unstable individual
10 pipe supports, we never seemed to agree on a defini-
11 tion. We proposed a definition, and apparently it
12 was rejected by the applicant. So, in order to
13 achieve a viable means of resolution of this issue,
14 we believe it's necessary to first clearly establish
15 a mutually agreeable definition of instability and
16 then proceed with an analytical or physical fixes
17 for these, quote, unstable pipe supports. Now, the
18 definition that we proposed during the last meeting
19 was that instability would be the ability of a pipe
20 support to shift or move to an unqualified position.
21 In this respect, we aren't saying that it is
22 necessarily a safety concern to the extent that we
23 aren't implying that it necessarily results in an
24 unstable piping system or other collapsed mode
25 failure, but we're saying that if the support does

1 not have a positive controlled clamping mechanism
2 to assure that the support cannot slide or rotate
3 along the pipes, then we have difficulty accepting
4 the analysis for that support because of the uncer-
5 tainties involved in that design.

6 MR. IOTTI: I don't think we fundamentally
7 disagree with the definition. We tend to disagree
8 in the word unqualified position, because it
9 depends on how you define unqualified as to where
10 we may have some --

11 MR. BOSNAK: To me unqualified means unanalyzed --

12 MR. IOTTI: Unanalyzable. If it hasn't been
13 analyzed and all analyses -- any analysis has cer-
14 tain qualities. A support has to be in a certain
15 location the analysis puts it. It doesn't effect
16 the result of the analysis if the support is off a
17 certain amount. So if you could define unqualified
18 as being within those tolerances. And then I don't
19 think you yourself would have a problem with the
20 definition of the word, as long as the control
21 exists that prevents that support from moving
22 farther out than this region, within which the
23 analysis would hold, then you would consider that
24 stable.

25 MR. BOSNAK: I could accept that.

1 MR. IOTTI: In that sense, I think we would
2 agree with you. Also, in the second sense, is in
3 the word positive control. There's two things
4 that can be defined as positive control. One is
5 where you design a positive control intentionally,
6 in other words, you make sure -- absolutely sure
7 by design that that positive control exists. And
8 another way for positive control to exist where
9 the geometry of the system gives you positive
10 control and you don't necessarily have to design
11 for it.

12 MR. BOSNAK: That's a case-by-case situation.
13 The other is generic.

14 MR. IOTTI: We can agree -- with those two
15 caveats we can agree with that definition. That's
16 been the board's disagreement in the last meeting.
17 We can't agree on the definition of positive control.
18 We can't agree on the definition of unqualified
19 with -- another way of putting it is if there is
20 no control, and this thing can move in some manner
21 where the system becomes unanalyzable because the
22 uncertainties become so many that you can't possibly
23 address them.

24 MR. BOSNAK: There are uncertainties which
25 you might be able to identify, but you might not be

1 able to model.

2 MR. IOTTI: To me, it's the same thing as
3 unanalyzable. When I defined unanalyzable, I
4 just wanted to state for the applicant where we
5 disagree with the definition of instability that
6 was put forth by the Commission, by the staff,
7 last time. We don't disagree with the definition
8 itself, we disagree with some of the terms within
9 the definition.

10 MR. BOSNAK: Probably we didn't communicate.
11 In other words, we didn't get into the details
12 enough to understand how you could have solved
13 the problem, and, therefore, we couldn't -- we
14 could not agree.

15 MR. IPPOLITO: I think we have reached an
16 agreement. Am I wrong? I think Dave has defined
17 what we believe to be instability. You have said
18 you agree, provided that we agree in the two areas
19 mentioned, and I think staff would agree to that
20 as stated by Mr. Iotti.

21 MR. BOSNAK: One is a generic sense and the
22 other is a case by case.

23 MR. IOTTI: I mentioned yesterday the easy way
24 to proceed right now is to address those two areas,
25 positive control, and whether the problem is

1 analyzable or not. We have to talk specific, if
2 I recall that from our last meeting. We are not
3 talking about a large number of supports falling
4 into the category. You can correct me if I'm
5 wrong. You have a concern over a particular one,
6 there is only one of those.

7 MR. IPPOLITO: If we can agree to a definition,
8 I think that would be a milestone. Once we agree
9 with the definition, I want that for the record.
10 Do we agree with that definition? Then you may
11 want to proceed with the area in which you are
12 going.

13 MR. VOLLMER: One point needs clarification.
14 I think what Iotti had indicated in his concept
15 of definition, there was an implication that design
16 included certain margins under which the design
17 would still be applicable if there was motions
18 of the pipe support. Is this marging quantified
19 in design or is this something that is an inherent
20 process? In other words --

21 MR. IOTTI: Can be inherent in the geometry
22 of the design. That's where you have to discuss
23 each specific case.

24 MR. VOLLMER: You're saying that in the design
25 process that there are numbers called out that the

1 pipe support is normally plus or minus so much
2 that the design is applicable.

3 MR. BOSNAK: Those would be positive tole-
4 rances.

5 MR. IOTTI: Yes.

6 MR. BOSNAK: Quantifiable.

7 MR. IOTTI: Positive and negative tolerances.

8 MR. BOSNAK: But quantifiable.

9 MR. IOTTI: Yes, because you can analyze the
10 problem. So I guess we agree. If the staff can
11 agree to those caveats on the definition, we'll
12 agree with the definition.

13 MR. BOSNAK: When you go out and identify
14 each of the problem supports, you would have to
15 then identify how you are going to solve it, whether
16 it be by the generic sense or --

17 MR. IOTTI: That's correct. That's consistent-
18 ly what Tom has said. We would tell you what our
19 plan of attack would be, if it's just changing it
20 because it's a lot faster. We might not even
21 agree with you that it's potentially unstable,
22 but it's a hell of a lot easier to change. Or we
23 may decide to analyze. If I am correct, we're
24 down to four supports. It's not worth spending
25 a month arguing over four supports.

1 MR. IPPOLITO: I think we have reached a
2 milestone. I think we've agreed on a definition.

3 MR. IOTTI: I don't know that I can speak for
4 David, I recognize that that is my own opinion.

5 MR. IPPOLITO: What was before, was before.
6 We have a definition. I think now we can proceed
7 with the definition. I think, David, what we were
8 going to do based on this definition, you are going
9 to identify certain groups or categories that you
10 feel fall within this definition.

11 MR. VOLLMER: I think his definition was
12 generic, and whatever it applied, I guess we could
13 discuss examples of that.

14 MR. IPPOLITO: Okay. Fine.

15 MR. VOLLMER: One point I think that needs to
16 be made, and it's perhaps inherent of what you said,
17 but I think it's an important one. We would not
18 expect, I say not expect, TUGCO to take a look at
19 the design drawings with the tolerances and say,
20 "Gee, that support fits within that," because any
21 lateral movement could be constrained to this
22 amount. We would expect that, I think as Tom
23 indicated, that the original design organization
24 would likewise find these acceptable, because that
25 would be needed to complete the design control

1 process.

2 MR. IOTTI: In essence, what you really are
3 telling me is that the initial design organization
4 must have gone through that thought process when
5 they designed or else --

6 MR. VOLLMER: Well, that's --

7 MR. IOTTI: We agree with that.

8 MR. BOSNAK: In other words, if they specified
9 a clamp, and it got changed somewhere along the
10 line, then whatever you ended up with has to go
11 back and be acceptable.

12 MR. IOTTI: That's correct. We don't disagree
13 with that.

14 MR. TERAQ: I think what I would also like to
15 add to your caveat is that in the specific supports
16 to have for each specific support some statement
17 from the effective -- effected design groups
18 regarding the acceptability of that support from
19 either I.T.T. Grinnell Home Office or M.P.S.I.
20 Home Office, whether they believe that support will
21 perform its intended function and not lose its
22 functionality because of any significant uncer-
23 tainties, and from the Gibbs-Hill offices an
24 assurance that the particular, quote, unstable sup-
25 port design will not effect the validity of their

1 piping analysis.

2 MR. IOTTI: Well, I'm not so sure I can inter-
3 pret that, because let's take a hypothetical that
4 that support is done by I.T.T. Grinnell, and I.T.T.
5 Grinnell, the home office, whoever designed it,
6 tells you in their opinion that support is stable,
7 it will behave stably.

8 MR. TERAQ: I didn't say in their opinion.

9 MR. IOTTI: Whatever. They say it's stable,
10 why should Gibbs-Hill do anything?

11 MR. TERAQ: Because ideally the supports, the
12 specific evaluations evaluated by the effected --

13 MR. IOTTI: The piping analysis group never
14 conducts that evaluation.

15 MR. BOSNAK: Who has the responsibility of the
16 whole piping system. You've got the supports and
17 you've got the piping, and there's always one or-
18 ganization that's responsible for the system as a
19 whole, and its performance. Piping and supports,
20 obviously one has an effect on the other.

21 MR. IOTTI: That's right.

22 MR. BOSNAK: So there's one group that does the
23 initial design, lays out the design specifications.

24 MR. IOTTI: That group is Gibbs-Hill. I
25 think what David is driving at, he would like

1 Gibbs-Hill to concur to that particular support
2 which is being stated as being stable. Gibbs-Hill
3 concurs with that. Gibbs-Hill is not responsible.

4 MR. TERAQ: I would like the design group,
5 the effected design group to evaluate the specific
6 unstable support in that design area from a func-
7 tionality standpoint of the pipe support, it would
8 be the I.T.T. Grinnell Home Office or M.P.S.I. Home
9 Office, but the effect of the support on the
10 validity of the piping analysis that would have to
11 be Gibbs-Hill.

12 MR. IOTTI: I understand. What I'm saying,
13 either I.T.T. comes back and says that support
14 we don't consider it stable, in which case the
15 only way Gibbs-Hill would have would be either
16 to remove it or simply confirm that that support
17 is assumed as being stable. Therefore, there is
18 no impact on the analysis. We can do it a lot
19 easier for us to have Gibbs-Hill review. I know
20 what the answer is already. The reason I keep
21 asking questions, I'm not so sure I understand
22 what you want.

23 MR. FIKAR: I am confused, also.

24 MR. TERAQ: There's quite a bit of difference
25 when Gibbs-Hill reviews an as-built drawing for

1 the general acceptability of that support verses
2 revealing a potential concern, a specific potential
3 concern, of a specific typed support configuration
4 to assess then that uncertainty on the validity of
5 the piping analysis.

6 MR. IOTTI: What you would like us to do if
7 there is a particular support which is alleged to
8 be potentially unstable, you would like to see
9 what the consequences of that instability if it
10 were in fact unstable would be on the system.

11 MR. TERAQ: If there's anything that the
12 piping stress analysis engineering group is aware
13 of that could either cause it to be more unstable
14 or whether or not they can see that.

15 MR. IOTTI: Okay. I had misunderstood what
16 you were --

17 MR. BOSNAK: If you take a generic approach,
18 what you're saying is correct, you know, the other
19 groups will establish the stability, but if you're
20 taking the case by case approach, you have set up
21 tolerances, and then those have to be --

22 MR. IOTTI: I understand. I misunderstood
23 what Dave was telling me. Now, I understand.
24 There's no problem for us to do that. But to a
25 larger extent, it will depend on the choice that

1 we make for each particular support, because if we
2 opt not to go through this route, we'll just fix
3 it to conform to what everybody will agree to, if
4 it's stable, that may be the simplest way. If we
5 choose the other way, then I agree we'll do so.

6 MR. TERAQ: I think we have reached an under-
7 standing.

8 MR. IOTTI: Okay.

9 MR. WADE: Do we need to talk about specific
10 types or are we set from the previous meeting as
11 to what these particular types are that you have a
12 concern with? Are they exactly the same ones we
13 discussed before?

14 MR. IOTTI: I think it's worth going back and
15 summarizing which one we have a concern so that
16 we --

17 MR. WADE: We don't need any misunderstandings
18 of what the scope of this is--

19 MR. IOTTI: I'm going to refer back to the
20 affidavit, David.

21 MR. WADE: That would be the easiest way, the
22 affidavit classifies them into different so called
23 types, so we'll refer to those type numbers.

24 MR. TERAQ: For the type one supports, these
25 are the box frames with single structure snubbers.

1 MR. BURWELL: I believe you're discussing --

2 MR. IOTTI: Page nine of the affidavit.

3 MR. BURWELL: Figure on page nine.

4 MR. IOTTI: Figure three, page nine.

5 MR. TERAQ: Figure four, page thirteen. .

6 These are the modifications made to the single
7 struts.

8 MR. IOTTI: Referring to the original design,
9 which is a box frame on a single strut. We no
10 longer have any of those, and the proposed modi-
11 fications or existing modifications to those are
12 listed on page thirteen, figure four, type one,
13 two, and three.

14 MR. TERAQ: I believe from our August 8th
15 and August 9th meeting, we commented about the
16 uncertainties involved in the modifications using
17 the index lugs and the additional strut. But the
18 modification used in U bolts we concurred that
19 from a stability standpoint, we found that the
20 U bolts when added to the box frame will preclude
21 either sliding or rotation of the box frames, the
22 pipe, so our concerns are only related to the first
23 two modifications.

24 MR. IOTTI: Okay. With regard to the index
25 lugs, at least I am prepared to tell you there is

1 only one. We haven't determined what we intend to
2 do. And I think one of the things we may want to
3 do is go look at it in the field. This is maybe
4 one of those situations where geometry is such that
5 it can't go anywhere in any case, and that which
6 way we're going to proceed --

7 MR. BOSNAK: Where is that location?

8 MR. IOTTI: I don't recall, but we'll take
9 you there.

10 MR. TERAQ: Let's move on to type two.

11 MR. IOTTI: Could you again refresh my memory
12 on your concerns for the type two, the ones for
13 the additional struts. There I don't think it's
14 so much lateral or axial movement.

15 MR. TERAQ: Both of those were either the
16 uncertainty involved in accounting for the friction.

17 MR. IOTTI: Unfortunately I don't have the
18 total number of these, but they are few. Okay.
19 So the second type is the one that had --

20 MR. TERAQ: The type two or the U bolts
21 single struts with thermal gap.

22 MR. IOTTI: Figure five, page fifteen of the
23 affidavit.

24 MR. TERAQ: The modifications that you have
25 proposed were to either sinch U bolts or to add

1 supplementary steel.

2 MR. IOTTI: Right.

3 MR. TERAQ: I believe our comments from the
4 stability standpoint on sinched U bolts, we felt
5 that your testing and analysis performed under the
6 different dispositions adequately precluded the
7 stability, the instability concern with this parti-
8 cular support, and with respect to the bumpers,
9 the supplementary steel, although we did not agree
10 with that fix, resolved the stability standpoint,
11 the stability concern, your analysis, which showed
12 that even without the supports on the main stream
13 line, the piping stresses were still acceptable to
14 us, makes this a mute point in the sense that I
15 think it's not worthwhile to argue whether or not
16 this is an acceptable size of restraint if the
17 analysis, even with this restraint excluded, shows
18 the stresses to be acceptable, and I don't think
19 we should argue the point any more.

20 MR. IOTTI: I agree.

21 MR. FIKAR: Good. We can make some copies of
22 this, of the affidavit.

23 MR. IPPOLITO: We've got one.

24 MR. TERAQ: I believe the one with the
25 bumpers, there was only one of those in the entire

1 plant.

2 MR. IOTTI: That's correct.

3 MR. TERAQ: Type three, unstable supports, the
4 double-strutted frames. And as we pointed out at
5 the last meeting, I believe these are either double
6 strutted or triple strutted, but the concern being
7 addressed in the double-strutted frame dispositions
8 related to really the single-plane -- hard single-
9 plane frames that are supported by struts or snub-
10 bers, probably struts, I doubt if they are snubbers.

11 MR. IOTTI: To the best of my knowledge, I
12 haven't seen any with the snubbers.

13 -- MR. TERAQ: These we didn't know at the time
14 how many large single-plane frames there were.

15 MR. IOTTI: There's a total of three, and they
16 are all triple struts -- yeah, they are all triple
17 struts. And again, I would propose that before we
18 do anything else, we go look at them. There are
19 some in the odds building and some in the electrical
20 building or near the electrical building. I have
21 the drawings. We can go to elevation below eight
22 seventy-three and look at all of them.

23 MR. TERAQ: We still have a concern on these
24 particular frames.

25 MR. IOTTI: I guess what we had discussed, was

1 an option of doing a bounding analysis to show that
2 even if the frame were to move, you wouldn't have
3 reverse consequences. After we look at them, we
4 may stay with the same option, we may change the
5 option. In any case, I think it would be worthwhile
6 for all of you to see the supports, these gang
7 supports.

8 MR. VOLLMER: We saw two of them yesterday,
9 we didn't see the other one.

10 MR. IOTTI: Those are it.

11 MR. TERAQ: But our concern with the home
12 offices of I.T.T.Grinnell and M.P.S.I. and Gibbs-
13 Hill to comment on these frame designs not only
14 through a bounding analysis --

15 MR. IOTTI: Well, I guess it would apply if
16 our intent is to do an analysis. If our intent is
17 to change them, of course, I'm not so sure whether
18 it would be worthwhile to go back.

19 MR. VOLLMER: Fix them where they are?

20 MR. IOTTI: I guess I have to confirm how
21 many of these double-strutted box frames there are.

22 MR. BURWELL: Off the record.

23 [A short time was had off the record. There-
24 after, the following proceedings were had.]

25 MR. BURWELL: On the record, please.

1 MR. TERAQ: The type four restraints are the
2 single-strut snubbers with snub U bolts. From the
3 last meeting I believe our comments were that from
4 a stability standpoint and from the testing and
5 analysis that were performed on the U bolt sinching
6 summary disposition, we found that these restraints
7 were stable. At this point, what I would like to
8 do is to go back to our agreed upon definition of
9 instability and have the applicants then identify
10 if there's any other supports that fall under that
11 definition that are not included under these four
12 categories.

13 MR. IOTTI: Dave, I don't have the answer to
14 that question. We are going to be looking. We
15 don't think there are any, but we'll have to go back
16 and provide you with that answer.

17 MR. VOLLMER: Part of what we said we would
18 ask you for was a program using this definition to
19 go out and make sure that everything had been
20 looked out and identified.

21 MR. TERAQ: So then there's the fifth cate-
22 gory that we don't know what's in there at this
23 time?

24 MR. IOTTI: Whether there's any?

25 MR. TERAQ: Whether there's any, if it per-

1 forms under our agreed definition even it should be
2 addressed in this fifth category.

3 MR. HORIR: The point I would like to make
4 is that with respect to this fifth category that is
5 an area where we are getting beyond the scope of
6 the actual motion itself. My question to you, I
7 would like to get your opinion, we have our opinion,
8 is that when we go into areas that are beyond the
9 questions that we are raising in the motion itself,
10 perhaps it would be best to address those on a
11 separate track as opposed to leaving the motion
12 itself awaiting a resolution until we get to those?

13 MR. TERAQ: I believe that's a legal question
14 that our lawyer should be answering. Unfortunately
15 we don't have our lawyer with us today.

16 MR. IPPOLITO: Let me pursue that. As far as
17 I am concerned I think at this meeting we finally
18 defined what stability is. The motion concerns
19 the issue of stability. Now that we understand
20 each other, it's -- to me it's everything that fits
21 within that definition. I mean to me it properly
22 belongs to your motion.

23 MR. HORIR: The motion addresses the types
24 of supports which were identified by the inter-
25 vener as being potentially unstable, and the motion

1 was filed as part of a plan to resolve the inter-
2 vener's allegation.

3 MR. BOSNAK: We're interested in making sure
4 it meets all of the requirements.

5 MR. HORIR: We don't disagree with that at all.
6 We're just questioning whether the proper attack is
7 to include that within the motion itself.

8 MR. IOTTI: We keep talking as if there were
9 some that fall within category five. Why don't we
10 find out if there are any. I don't think there are
11 any. The other thing I would like to suggest, we
12 define functional ability by the definition, be-
13 cause someone along the line is going to challenge
14 our definition of stability.

15 MR. BOSNAK: We would prefer that.

16 MR. TERAQ: The way I described these supports,
17 I said that the word unstable is actually a mis-
18 nomer when applied to pipe supports individually,
19 that really the concern is that the precariousness
20 of the support that there is uncertainty, and it
21 does not necessarily fall under the classical de-
22 finition of stability -- instability.

23 MR. HORIR: Tom, before we leave the point,
24 could we get an agreement that will at least dis-
25 cuss with your legal staff, the proper approach for

1 this stiff category.

2 MR. IPPOLITO: I'll assure you that's what
3 we'll do.

4 MR. TERAQ: Leaving our established definition
5 of instability on individual pipe supports,
6 functional ability, precarious supports.

7 MR. IOTTI: It doesn't matter what we call it
8 here.

9 MR. TERAQ: From our last meeting, we did ask
10 for some further information on the acceptability
11 of the supports with the extended mass that we are
12 still looking for, but I do want to point out that
13 it doesn't fall under this specific category of
14 "unstable pipe supports".

15 MR. IOTTI: I'm sorry. I am missing a point.
16 Maybe your name -- the names you have given ex-
17 tended mass.

18 MR. TERAQ: There was an extended mass with a
19 trunnion and U bolts holding that extended mass on
20 to the pipe.

21 MR. IOTTI: Yes. I understand. We are
22 scheduled to have the information to you at the
23 end of next week. Okay. We haven't forgotten. I
24 just needed to refresh my memory as to what it was
25 that we are talking about.

1 MR. IPPOLITO: Does this mean this is another
2 technical issue which is or is not within the scope
3 of the summary disposition?

4 MR. TERAQ: No. I'm saying this is within the
5 scope of stability, but it's not under the scope of
6 our established definition of instability. This
7 actually falls under the classical sense of the
8 definition of instability that indeed these sup-
9 ports are unstable from a classical sense, and we
10 just wanted some verification of what was done to
11 justify that design.

12 MR. IPPOLITO: It is within or out. Do I
13 have to talk to the lawyers as to whether or not
14 this is to be discussed as our responsibility to
15 the summary disposition or do we put that in an-
16 other box?

17 MR. HORIR: That's another one we think should
18 be in another box. It wasn't addressed within the
19 scope of --

20 MR. BOLTZ: May I ask a question? On the
21 responses within the scope of the contention that
22 the utility is going to make the NRC, does case
23 receive a copy of this or is case going to receive
24 a copy?

25 MR. IPPOLITO: Yes.

1 MR. BOLTZ: And matters outside the scope of
2 the contention, if there are any, depending if there
3 are any supports that fall into the category, and
4 depending on what the two lawyers do, would case get
5 a copy of those?

6 MR. IPPOLITO: Yes.

7 Let me propose the following: We have not had
8 an opportunity to caucus with John. What I propose
9 is like a twenty minute break caucus with John and
10 we would proceed with the generic stiffness as we
11 have hopefully proceeded with the stability ques-
12 tion. Okay.

13 MR. BURWELL: Before we go off, may I raise
14 the question, I believe Dr. Iotti recommended that
15 we go look at the gang hangers. In any event, do
16 we desire to do that or not? I'm not comfortable
17 that a decision was reached on that.

18 MR. BOSNAK: We would like to go later after
19 this is over this afternoon.

20 MR. IOTTI: Not just the gang hanger, but
21 also what we call the keyed box frame if you would,
22 index lugs.

23 MR. VOLLMER: I would like to see the shield
24 as a separate issue, that is a separate issue. I
25 have time problems.

1 MR. IPPOLITO: Okay.

2 MR. VOLLMER: I also would like to set it up,
3 I have a five o'clock plane.

4 MR. FIKAR: That has nothing to do with this
5 hearing.

6 MR. BURWELL: What have you just told me? Are
7 you saying you want to do it now or do you want to
8 wait or try to do Mr. Fair next?

9 MR. VOLLMER: I would like to do Mr. Fair
10 next, and if it could be handled as expeditiously
11 as that was.

12 [A short time was had off the
13 record. Thereafter, the fol-
lowing proceedings were had.]

14 MR. BURWELL: I believe we are ready at this
15 point and time to discuss the motion for summary
16 disposition entitled Applicant's Motion for Summary
17 Disposition regarding use of Generic Stiffnesses
18 instead of Actual Stiffnesses in Piping Analysis,
19 my accent on that, that's A-c-t-u-a-l, actual
20 stiffnesses in piping analysis. This motion was
21 filed on May 21, 1984. I believe we received some
22 additional information on this item by letter
23 dated July 16, 1984.

24 MR. IPPOLITO: Okay. What I'd like to do is
25 to make sure we are all at the right -- all have

1 the correct understanding of where we are at this
2 point in time, because we have had again a number
3 of meetings. I would like to have John Fair
4 summarize for the staff where we believe we are
5 and see if we all agree, and then we will proceed
6 from there. Okay. John.

7 MR. FAIR: Okay. The applicants have used
8 generic stiffness values as a modeling assumption
9 in piping analysis for class two and class three
10 piping systems. In designing these supports, how-
11 ever, they used a deflection criteria with the
12 applied load from the piping analysis. Therefore,
13 there was no direct correlation between the modeling
14 assumption and piping analysis and the supports
15 design. The item raised an issue with this assump-
16 tion used for the support design whether it ade-
17 quately represented the actual support stiffnesses
18 as built in the field. In order to answer this,
19 the applicants analyzed a few sample piping analy-
20 sis problems in their summary disposition. In one
21 of the piping analysis problems, it turned out that
22 a support was overloaded by approximately fifty-
23 seven percent. This staff did not agree that this
24 set of analyses demonstrated adequacy of the gene-
25 ric stiffness used. The applicant did another

1 sample of four piping analysis, and again identified
2 one case where the supports would be loaded above
3 the allowances. At the last meeting, we were still
4 not in agreement that this demonstrated the adequacy
5 of the design practice on stiffness. Therefore, the
6 applicants were going to go back and propose an
7 additional screening criteria to try to determine
8 which supports were of concern and how to resolve
9 the issue.

10 MR. IPPOLITO: Is that where we are?

11 MR. IOTTI: That's where we are. This is
12 precisely correct. Yes.

13 MR. IPPOLITO: I hope the applicant is able to
14 respond.

15 MR. IOTTI: The applicant is partly able to
16 respond, because our schedule to respond fully to
17 you was to respond by the 30th. Unfortunately, it's
18 not the 30th. I have some material with me that I
19 can -- if you wish to discuss it, but I would like
20 to go back a little bit to the beginning. Applicants
21 have submitted all of these analysis, not because
22 they believe there was anything wrong with using
23 the generic stiffness, that's being used by other
24 applicants in other plants, but there was a con-
25 cern expressed both by the intervener and by the

1 staff. We still don't believe there's anything
2 wrong with the approach of using generic stiffnesses.
3 You have to understand that some of the results that
4 have been achieved by the most recent analysis, still
5 have very significant conservatisms within them,
6 which we have chosen not to remove because we think
7 they are still applicable. We could still have the
8 opportunity to go back and remove the conservatisms,
9 and those results will probably show no overloading
10 of supports. I say probably, because we haven't
11 done so. Just my own opinion. We have to distin-
12 guish, I think, between what -- I don't want to call
13 it a standard industry practice, because unfor-
14 tunately there doesn't seem to exist a real stand-
15 ard industry practice with regard to using generic
16 stiffnesses with class two and three piping. Every-
17 body does it in a different manner. In this regard
18 we are no different than many. A lot of people
19 just use the assumption that these supports are
20 tctally rigid. It's the very same people that em-
21 ploy snubbers, the same snubbers we are employing
22 here. One of the conclusions that we have arrived
23 at from our analysis that the snubber turns out to
24 be the weak link in determining the actual stiff-
25 ness of the system, not always, but in a large num-

1 ber of cases. So again, let's distinguish those
2 two facts. Our analysis was done in the same
3 manner as being done in many many plants, the ma-
4 jority of plants in this country including the
5 plants of the vintage of Comanche Peak. What we
6 then have done is attempt to demonstrate even if
7 you were to use the actual stiffness, the same
8 approach employed there would be no safety concern.
9 It is true we have identified for some of the
10 analysis that some of the supports if you were to
11 do the analysis with the "Actual Stiffness", and
12 you have to bear in mind when we're referring to
13 actual stiffness, we're referring to calculated
14 stiffness, which may or may not be the real stiff-
15 nesses. They are out there. Okay. These are
16 calculated stiffnesses. Then you might calculate
17 some of the supports to be overloaded. Those that
18 we have found so far, we believe even though over-
19 loaded in the strictest sense, would not fail. So
20 again we don't think there is a safety impact. But
21 we also found as part of our work, that invariably
22 the supports that turned out to be not just over-
23 loaded, but overloaded by the rated load, actual
24 load verses rated load, turned out to be snubbers
25 and also snubbers which were initially very lightly

1 loaded. The combination of the light loading is
2 what prompted the stiffness of this particular
3 support to be much lower than the generic stiffness.
4 Let me take you through a numerical exercise if you
5 will. Let's take a particular support and let's
6 suppose that this support is comprised of a frame
7 and snubber attached to that frame. Because the
8 applicant uses the deflection criterion, they
9 would take the load as determined from the piping
10 analysis, and the load in the piping analysis you
11 have to understand has implicit in it that the
12 seismic deflection of the piping is very very small.
13 For instance, an average seismic deflection of
14 piping at the support point is generally left
15 in six mil, that gives you a load, but that load is
16 applied, as John Fair so well put, to a frame that
17 has to satisfy a deflection criterion of one-six-
18 teenth. Let's suppose that that load turns out to
19 be a low load. If you take a low load and you use
20 a one-sixteenth criterion of the frame, you can
21 have a frame that's very very low stiffness. Let's
22 say the frame deflects .06 inches, close to one-
23 sixteenth, to get stiffness, you just divide the
24 load by the deflection. So if the load let's say
25 is fifty pounds, you divide fifty pounds by .06.

1 You end up with a stiffness of nine hundred pounds
2 per inch. Let's say that this is a four-inch line.
3 The generic stiffness -- I think it's two times ten
4 to the fifth. Two times ten to the fifth. So right
5 there you have more than two orders of magnitude
6 change in stiffness. Of course, when you re-analyze
7 with the actual stiffness, you may see the load of
8 that particular support increase that drastically.
9 On the other hand, if you don't load it to fifty
10 pounds, so you don't get increase of a factor of
11 ten, so you don't load five hundred pounds. If it
12 shows a snubber, let's say a PFA one-half snubber,
13 you increase a factor of ten. This is all hypo-
14 thetical. We haven't seen this CASE, I am just
15 taking you through a numerical exercise. That snub-
16 ber would be calculated as being a load. So what
17 that does, what I'm telling you, is that that snub-
18 ber wasn't needed to begin with. The load was so
19 low you didn't need support to begin with. If you
20 take that support out, nothing happens, stresses in
21 the pipe are still okay. The other supports acco-
22 modate the remainder of the load. What all of our
23 sensitivity studies have shown that type of support
24 tends to be predicted as being overloaded. Our
25 supports, which are initially low loads and tend to

1 be standard components, which have rated low, and
2 the designer rather than using a conservative ap-
3 proach will take the standard components which is
4 next to it, so you normally have a little margin be-
5 cause of the particular set of circumstances. And
6 this is what prompted our suggestion that we could
7 arrive at a set of criteria that would enable us to
8 determine without doing an analysis which particular
9 supports per pipe size might be candidates were you
10 to take an analysis with these actual stiffnesses
11 for potentially overloading. I am prepared to dis-
12 cuss some of the initial findings, for instance, we
13 don't need to look at any lines that are four inches
14 or less. We just -- just no way that the normal
15 design process would lead you to under design sup-
16 ports now, and then in lines that are larger than
17 four inches but less than twelve inches, we would
18 be concerned with, if the applicant has used snub-
19 bers like a PSA one-half or PSA three-fourths, be-
20 cause the loads were very low. Then those snubbers
21 may not have significant capacity to accomodate
22 other load increases that might accrue out of actual
23 analysis. I am just describing for you the set of
24 criteria you will come up with. We have not fin-
25 ished the work. Even if the work is completed at

1 least what I have done, somebody has to check it,
2 verify it. We need to try it out and see how well
3 it works. That hasn't been done yet. As a matter
4 of fact, I was going to complete that and call John
5 and sit down and explain it to him what we have
6 done and see if he would agree with it. So that's
7 where we stand at that point. I would just like to
8 reiterate that so far none of the results that we
9 have seen, would tell you that we have a safety
10 problem. In other words, even if we were to remove
11 the snubbers that turned out to be overloaded, the
12 stress analysis would say your piping system is
13 okay, the remainder of the supports are capable of
14 accepting the loads. And to us that's really what
15 it boils down to. There's no question in our minds
16 that the generic stiffnesses approximation -- it's
17 a convenient approximation that's been made by many
18 others and ourselves. Whether it's a good assump-
19 tion, whether it's good engineering approach to be
20 taken for the design of the piping system, depends
21 on whether if you use it you have a piping system
22 which is safe as opposed to having a piping system
23 that's specified to the 10th degree. You will
24 never get there. If we were to use the actual
25 stiffnesses, those are not likely to be the actual

1 stiffnesses that you will see on sight, because
2 there is a small gap in any support or there is a
3 small place. In reality, the true actual stiffnesses
4 bear only some resemblance to calculated actual
5 stiffnesses. So we should not lose track of that
6 also, and that's why we think at that point, we've
7 gone as far as we can go other than completing the
8 lastest efforts that we've committed to do, which
9 we'll complete by the end of next week. I guess I've
10 said my piece at this point.

11 MR. WADE: It boils down, we think that we're
12 well within what has been done in the past in the
13 industry and that because of inherent conservatism
14 in the piping analysis that our approach is per-
15 fectly acceptable. We have no reason to believe
16 otherwise.

17 MR. IOTTI: There's one other item that I
18 would like to ask for completeness. Where the gene-
19 ric verses actual stiffness has the most pronounced
20 effect on the results of the piping analysis and
21 the possible safety implications of piping analysis
22 in the seismic analysis. You have to bear in mind
23 that this, because we also submitted affidavits on
24 safety factors. The reason we did so is so that
25 at least you will be aware that the seismic analy-

1 sis has inherent conservatisms which are present
2 in the analysis that are being performed. So what
3 I'm saying is there is conservatism in the analysis.
4 There is different types of conservatisms, some is
5 in the method of analysis itself. But in addition
6 to that to pinpoint to the analysis the input mo-
7 tions are already conservative. It's true you can
8 even play this game. The problem with generic
9 verses actual stiffness is that you can play this
10 game forever. In other words, we can go back and
11 analyze every piping system in the plant, and two
12 months after we do, we're analyzing them again be-
13 cause some information says, "Well, the stiffness
14 there is really not what you should assume, you
15 should assume something else."

16 MR. WADE: Two different analyst can come up
17 with different results depending on how he models
18 the piping system itself. These things all come in
19 to play. Simplifying the assumption in generic
20 stiffness is certainly acceptable with the conser-
21 vatisms that are built in to account for those un-
22 certainties.

23 MR. FAIR: I said before that I agreed that
24 generic stiffness was a standard practice used by
25 the industry. I have no problem with the generic

1 stiffness using those assumptions in piping analysis.
2 I disagree with your statement that you do it ex-
3 actly like the rest of the industry. There are
4 variations amongst the industry. Some of the in-
5 dustry actually calculated the supports stiffness
6 by other stiffness criteria.

7 MR. WADE: A lot do not.

8 MR. FAIR: I disagree, that having to evaluate
9 the stiffnesses is a non-ending loop. We have
10 established that you can vary quite a wide range
11 with those assumed generic stiffnesses with no im-
12 pact on piping analysis. And as we have already
13 identified, it's just those cases that come out
14 very lightly loaded of supports that have very high
15 flexibility that can have an impact on the piping
16 analysis.

17 MR. FIKAR: It's a non-ending loop, Tom. We
18 filed this thing in May. We're going to load fuel
19 in six weeks. We ain't there. We would like to get
20 there if there's some -- if we could narrow that
21 down, let's close that loop, whatever it is. You
22 know, it's really not -- it's, I guess, the way
23 some sampling was done or some analysis.

24 MR. IOTTI: I think it's categorized correctly.
25 I didn't mean an unending loop you and I could

1 never agree as to when we would finish. Rather I
2 am saying there will always be a third person come
3 in and say, "I disagree of how you've done the cal-
4 culation of stiffness, and you'll have to do it over
5 again." And in that sense, it's not something that
6 can be precisely addressed.

7 MR. FAIR: We're not talking about precision
8 here. We have established that within your -- with-
9 in an order magnitude of your generic value, you
10 didn't have any significant impact on piping analy-
11 sis based on your samples. I agree with you that
12 you cannot precisely calculate the stiffness of
13 supports in the field to three decimal places. But
14 in order of magnitude, is a reasonable number to
15 shoot for.

16 MR. IOTTI: Well now, I would agree with you,
17 but you can certainly calculate it within a factor
18 of two. I think our disagreements are getting less
19 and less. The question is what do we do next.

20 MR. WADE: We need a conclusive practice to put
21 this issue to bed so that when we finish this effort
22 we know that results are going to be the end, and
23 there is not going to be another loop that we have
24 to go through.

25 MR. IOTTI: Our intention is to complete this

1 designing criterion definition which will tell you
2 how you would identify per pipe size the supports
3 which could be susceptible to overloading were you
4 to do an analysis. The designing criteria will ex-
5 clude certain pipe sizes, because there doesn't seem
6 to be a way in which you will ever get into an area
7 of specific loads at which -- there is no reason to
8 believe that there may be some supports as being
9 overloaded. The load itself is not the criteria,
10 the load in combination with the type of standard
11 components is really the criterion. For instance,
12 there will be variability loads. Let me give you
13 an example. We may say for a sixteen inch line,
14 any support which -- if there are any supports which
15 are loaded less than three hundred pounds, we ought
16 to look at that particular stress problem, because
17 there would be a support which will have both a very
18 low stiffness, something of the order of two orders
19 of magnitude less than generic stiffness. That
20 particular support happens to be a standard component
21 instead of PSA3, which you would expect to see on
22 size line maybe a PSA1 or one-half then that could
23 be overloaded. That's the type of criterion we'll
24 have for you. I want to confirm that's what we're
25 gearing to.

1 MR. WADE: What is your acceptance criteria
2 for all that? What does it take to satisfy you.

3 MR. FAIR: We would like to see what you are
4 proposing. I am in agreement with Dr. Iotti that
5 the correct criteria is the lightly loaded support
6 and it should be based on pipe size.

7 MR. IOTTI: To go further, what then we pro-
8 pose to do is, one, we identify that particular
9 stress problem that is a candidate to have some of
10 these supports. We have two options to go, one of
11 them to take that support out and rerun the analy-
12 sis without calculating the stiffness, take out to
13 see if anything happens. Okay. If you don't need
14 it to begin with, who cares. The other option is
15 actually calculate the actual stiffness and re-
16 route that particular stress problem and then de-
17 termine what the consequences would be, and they
18 might show us an overload or not. And what Dave is
19 trying to add that we're shooting an elusive target,
20 we don't exactly know how far you want us to go in
21 this or what would be acceptable to you. In other
22 words, where do we draw the line? We will review
23 every stress problem from this standpoint looking
24 at the results, identifying the stress from this
25 criteria, define which stress problem may have to

1 be looked at again. That far we can go.

2 MR. WADE: We don't want to proceed with the
3 re-analysis until we know what the accepted criteria
4 is, once we have that, we can proceed beyond that
5 point.

6 MR. FAIR: We certainly have acceptance crite-
7 ria for the design supports and pipe at the facility.
8 I don't see there is any question of what the
9 acceptance criteria is.

10 MR. IOTTI: I think he's looking at something
11 else. Let's say there are two thousand stress pro-
12 blems in the plant. We've seen seventeen thousand
13 supports. Okay. And we can look at all two thou-
14 sand stress problems. That's one way to do it. You
15 can only look at a percentage of those and draw a
16 conclusion that you have a certain confidence. Say
17 if you look at two hundred and fifty of those, and
18 you find nothing within two hundred and fifty with
19 regard to safety, you can draw a conclusion, you can
20 say, "Well, if I were to look at the other one thou-
21 sand, whatever, one thousand and six hundred or so,
22 you would find no more than maybe a certain number
23 of supports which would fall in that category." You
24 can say that with a certain confidence level. What
25 he's saying, what is the criterion? One hundred

1 percent confident there is none, ninety-five percent
2 confident there is less than one percent.

3 MR. FAIR: You just said a couple of thousand
4 stress problems. How many exactly greater than four
5 inch piping analysis problems.

6 MR. IOTTI: I don't know, that's part of the
7 stuff I have got to do next week.

8 MR. FAIR: I thought it was in the order of a
9 couple of hundred.

10 MR. FIKAR: We don't want to do everything and
11 satisfy there is no problem. That's a waist of
12 time. Maybe I am addressing Vollmer and Bosnak.
13 Go out there and look at that plant. You have
14 never seen hangers as massive in any plant you have
15 been into as you have seen here. The seismic zone
16 is the lowest in the country. Conservatism, con-
17 servatism, conservatism. We don't want to waist
18 our resources doing a bunch of studies which we are
19 absolutely confident are going to come out all
20 right. That's what we're pleading for. We didn't
21 put snubbers in, because we didn't think they were
22 needed based on our criteria. Again if you want to
23 re-analyze and somebody says you can't do that,
24 you'll probably analyze that one way. I don't want
25 to give the impression we put something in there we

1 didn't need. And it's generally standard industry
2 practice. That's what's concerning us.

3 MR. FAIR: I haven't agreed in total that your
4 total design practice being standard industry
5 practice all the way through. I believe there is
6 part of it that do conform with the standard in-
7 dustry practice. The other side is as far as
8 acceptance criteria once we determine a proper
9 screening criteria to look at the supports where-
10 ever we come across the supports, we ought to agree
11 on --

12 MR. IOTTI: Okay. I mentioned two options,
13 one of them is re-analysis, the other one is re-
14 moval and re-analysis with generic. Where the
15 most uncertainty comes in, in my opinion, is not
16 re-analysis with the generic stiffness, because
17 that's standard method. But if you then get down
18 to the calculations of all the actual stiffnesses
19 for that particular systems -- I mean what's the
20 merit of doing that if your approach is to just
21 take that support out.

22 MR. FAIR: Well, I'm not in agreement with
23 that statement. If we had determined from your
24 affidavit and studies that there is a range of
25 stiffness which has no significant impact on the

1 piping analysis, then why do you have to calculate
2 the stiffness of every support that passed your
3 screening criteria.

4 MR. IOTTI: Then I don't have any disagreement
5 with you. Then we'll just either take the support
6 out or -- in other words, it's our option at that
7 point as to what we're going to do. So I guess what
8 we have agreed to do, is that we'll wait until we
9 formalize the screening criteria. I can go over
10 with you my scratch notes. I haven't formalized
11 them yet. You will know all of what it is you're
12 going to get at the end of next week, it will come
13 as no surprise. Particularly if you don't agree
14 with it, I would like to know now, because it will
15 save me an exercise in futility. I have tested
16 over a few piping systems, it seems to work. In
17 other words, I have been able with this criterion,
18 to come to the same conclusions as I did with all
19 of the analysis that has been submitted to you. We
20 would predict a few more supports than what we have
21 actually found to be overloads. It would identify
22 the stress problems that we analyzed but found
23 nothing wrong with. So at least it meets that test.
24 But I want to do it a little bit more. What I
25 don't have is how many stress problems we'll end up

1 with when we apply this screening criteria. I don't
2 know that yet, because that's the part that we'll
3 be doing next week. He'll go back and look at
4 every stress problem and identify the supports, and
5 then either include or exclude that particular
6 stress problem.

7 MR. FAIR: Let me ask you a question. If you
8 were to select the option where you would just as-
9 sume the support is not in the analysis, what would
10 you do in the field with that support?

11 MR. IOTTI: Remove.

12 MR. FAIR: Okay.

13 MR. IOTTI: I don't want it there. If we
14 can't remove it, then that option is not viable to
15 us. We would re-analyze the actual stiffness.

16 MR. FIKAR: Well, I am concerned we are going
17 to get involved with a whole bunch of re-analysis
18 and overly cautious concern, and it's going to cost
19 us time, money, and effort. That's my problem.
20 You all after having hearing this, maybe we can get
21 together.

22 MR. IPPOLITO: I'm going to say what I think
23 I heard, and I will demonstrate my ignorance of the
24 subject. I think I can summarize what I'm hearing.
25 I summarize what I'm hearing is that you propose to

1 use a method of analysis to consider generic stiff-
2 ness.

3 MR. IOTTI: Well, that method of analysis. It
4 was reviewed. It was approved by the F.E.R.

5 MR. IPPOLITO: Fine, but in going back and
6 looking, we find that generic stiffness, does that
7 envelope all of the system or all of the supports?
8 The question is now that we know that, what do we
9 do about it now? I change that statement. Now that
10 we know that, what are you going to do about it?
11 And what upsets me a little bit about this conver-
12 sation, I'll tell you frankly, you seem to be tell-
13 ing us, the N.R.C., tell me how much is safety. I
14 think the applicant has to sit down and say, "Given
15 this problem, how do I resolve this problem." Okay.
16 And then we'll review that problem, I mean your
17 recommended solution to that problem.

18 MR. FIKAR: I don't even know if we have a
19 problem.

20 MR. IPPOLITO: That's fine.

21 MR. IOTTI: I'll make a stronger statement
22 than that. We have done enough in our opinion to
23 have satisfied ourselves that there was no safety
24 implications, so we didn't -- if we had taken the
25 attitude that you are trying to characterize us

1 with, what we would have done, we could have stone-
2 walled this. We have done what other industry has,
3 why should you do anything with actual stiffness, we
4 didn't do. We put in the actual stiffnesses. We did
5 sampling, and on that sampling basis, we determined
6 -- applicants did, and I concur with that. I am
7 not the applicant per say. There is no safety con-
8 cern. That's my opinion at that point. How much
9 further, well, I can go further. I can do more
10 samples, and again I expect the result to be the
11 same.

12 MR. VOLLMER: You drew that conclusion based
13 on the fact that even though you had supports over-
14 loaded, it was your presumption that enough con-
15 servatisms existed so that there would have been no
16 failure.

17 MR. FIKAR: No safety issue.

18 MR. VOLLMER: Hear my words. I said you drew
19 a conclusion based on an assumption that otherwise
20 existed. I would like a demonstration of that.

21 MR. IOTTI: Well, it was based on two things.
22 One, that even though the supports were overloaded,
23 it wouldn't fail. That was one thing, because the
24 type of overloading we saw was not so large as to
25 cause the particular standard component in our

1 opinion to really fail, clearly exceeded the rated
2 load. And the second portion of our position is
3 that there was inherent in the input of analysis and
4 the method of analysis conservatisms that far out
5 weighed the nonconservatisms introduced by these
6 gneric stiffnesses. I want to make a statement that
7 I don't think it's fair to characterize the ap-
8 plicant that they don't have the concern. They did
9 what they thought was sufficient to satisfy the
10 commission; there was no safety problem. What we're
11 disagreeing is the degree to which we need to
12 satisfy the staff. That's why we have to ask the
13 question, because obviously we were satisfied our-
14 selves.

15 MR. FIKAR: We want to satisfy you within
16 some reasonable bounds, that's all I'm saying.

17 MR. IPPOLITO: Let me ask John a question.
18 Were you presented with the basis upon which these
19 conservatisms were considered to be bound, the
20 problem?

21 MR. FAIR: Well, they had two separate basis.
22 Dr. Iotti had the test data on a particular snubber
23 which showed that it would not fail under the load
24 they had calculated.

25 MR. IOTTI: That's the same snubber that was

1 calculated to be overloaded, PSA1.

2 MR. FAIR: And the second basis was another
3 summary disposition on safety factors of the seismic
4 design, which is somewhat of a -- we characterize
5 them as medium margins of safety in various ana-
6 lytical processes in the seismic design. There was
7 enough uncertainty associated with them that we
8 wouldn't use those numbers straight from that affi-
9 davit.

10 MR. IOTTI: That, of course, was your char-
11 acterization. The medium margin of safety we're
12 talking about is a factor of safety of forty-four
13 zero. Maybe we still consider that medium. We
14 never made a statement that that was the true mar-
15 gin of safety there, but it's of that order. We
16 are not talking factual twenty percent, forty per-
17 cent, fifty percent, we are talking large factors
18 in input. Primarily, that doesn't come from the
19 method of analysis, it comes from the actual seis-
20 mic input.

21 MR. FIKAR: That's my point, again, that the
22 seismic criteria, we get such a large safety factor,
23 which is really what this is all about, looking at
24 the plant and knowing what we've got here, there's
25 got to be some reason to all of this.

1 MR. BOSNAK: When we were here two years ago,
2 this was the problem at that time, and it sounds
3 like it still is. We haven't made much progress.
4 And the point was that it was not that you couldn't
5 use generic stiffness, but it was the deflection
6 criteria on the supports particularly where you had
7 a light loaded support, and we recognize that, you
8 know, seismic load. The definition that goes into
9 the load is very conservative, but in a way, that's
10 an apple and an orange we're looking at.

11 MR. IOTTI: I agree with that.

12 MR. BOSNAK: It sound like you're making some
13 progress on how do you identify the supports that
14 we need to worry about, and I don't think we want
15 to introduce the -- you know, the effect of seismic
16 analysis and the conservatism there. We are trying
17 to look at a particular support load path and which
18 ones are we going to be concerned about.

19 MR. IOTTI: The reason I made that statement,
20 was because Tom was a little offended at what he
21 thought was the applicants' attitude. That's not
22 the applicants' attitude. We have been concerned,
23 what do we do now that actual stiffnesses are dif-
24 ferent. We concluded in our own mind that it wasn't
25 a safety problem, and we stopped.

1 MR. BOSNAK: I think you're going down the
2 right path. The thing is when you have finished
3 what you have started, then we need to take a look
4 at what you have.

5 MR. IOTTI: I agree with that. The reason
6 we're asking the question is that, for instance,
7 when I complete the designing criteria and I apply
8 it, I would consider -- I will go far enough to
9 satisfy myself. I am assuming I will find no sur-
10 prises. I am assuming that it has convinced me.
11 So far that again has been worn out. I will be
12 very suprised if I don't. Given that, I will say
13 I have done enough, I'm happy, there's no safety
14 problem. That might not satisfy you.

15 MR. BOSNAK: We may or may not agree depending
16 on what you have looked at, I guess.

17 MR. IOTTI: I guess to the extent that you have
18 agreed that that's the proper way of proceeding,
19 I'm happy. At least I know what I'm shooting for.
20 I am not shooting at an open-ended type of approach.

21 MR. IPPOLITO: Are we sending that message?
22 Is that the message you want to give them?

23 MR. BOSNAK: Yes.

24 MR. IPPOLITO: Okay. I just wanted to make it
25 clear.

1 MR. IOTTI: Well, maybe the 30th of this month,
2 this whole thing will be put to bed. I hope so.

3 MR. IPPOLITO: Okay. Good.

4 MR. FIKAR: I do too, I hope so.

5 MR. IPPOLITO: Anything else on this subject?

6 Okay. We're ready to go on to another of your
7 summary dispositions. John, correct me if I char-
8 acterize it wrong. It's U bolts or U bolts used as
9 two-way restraints.

10 MR. FAIR: That's correct.

11 MR. IPPOLITO: John was in the process of com-
12 pleting his evaluation, and what he wanted to do is
13 to apparently go look at what were identified as
14 maybe eight or so of the most significant of these
15 U bolts and just confirm that, yes, in fact the
16 plant is built as you have indicated in your de-
17 sign and in your drawing. He went this morning with
18 your people, and the thermal "agra, whatever was
19 over it, was removed in front with John present.
20 John made some measurements. And I would like to
21 have John tell you what he discovered while he was
22 there. Did you see all eight?

23 MR. FAIR: Yes.

24 MR. IOTTI: John, are these the same eight
25 that we have identified as the --

1 MR. FAIR: Yes. I was going to lead this with
2 a little recap of the motion. These are the cases
3 where you use U bolts for one-way restraints with
4 the presumption that they provided no lateral re-
5 straints to the piping system. There were a limited
6 number which you identified in the affidavit. The
7 argument in the affidavit, the steps of the argu-
8 ment, went this way: there was a sixteenth of an
9 inch gap designed in these U bolts. You identified
10 eight of them where the total movement exceeded
11 that one sixteenth of an inch total seismic plus
12 thermal. You did some sample re-analysis, seismic
13 re-analysis, assuming no gap present for two of the
14 U bolts that had the largest total displacement,
15 found no problem with the piping analysis. Tested
16 a couple of sizes of U bolts, determine that they
17 could take substantial lateral deflections, and
18 then concluded that there was no safety concern
19 with these seventy U bolts. I have no problems with
20 your technical arguments that you put forth. The
21 only thing I wanted to do was to go out to the
22 field and take these eight U bolts and confirm the
23 existence and nonexistence of these gaps. As it
24 turns out, when I took the measurements this morning,
25 the sixteenth of an inch gap existed in the direc-

1 tion of restraint and not in the lateral direction.
2 As a matter of fact, six out of the eight supports
3 I checked had lateral gaps less than one sixteenth
4 of an inch, and only two of them had a sixteenth of
5 an inch gap or better in the lateral direction.

6 MR. IOTTI: I'm not sure I follow. What do
7 you consider directional restraints? Directional
8 restraint is up?

9 MR. FAIR: That's correct.

10 MR. IOTTI: Can you resummarize it again? You
11 said six out of eight had no gap laterally?

12 MR. FAIR: Had lateral gaps less than one
13 sixteenth of an inch, this is total lateral gap on
14 both sides.

15 MR. IOTTI: Right. That's the way it's
16 stated here.

17 MR. FAIR: There was one that had practically
18 zero gap in the lateral direction.

19 MR. IOTTI: That's total?

20 MR. FAIR: Total, both sides. Therefore, I
21 was unable to confirm that the sixteenth of an
22 inch gap exists on these U bolts.

23 MR. IOTTI: You said something else about the
24 restraint direction having a sixteenth of an inch--

25 MR. FAIR: I also looked at the drawings as

1 I was reviewing these supports, and the sixteenth
2 of an inch gap that is specified on the drawing is
3 in the direction of the restraint and not the
4 lateral direction.

5 MR. IOTTI: Which systems were they on? Do
6 you recall?

7 MR. FAIR: Majority of them were component
8 tooling.

9 MR. IOTTI: Okay. So that's been tested,
10 hasn't it?

11 MR. FIKAR: Uh-huh.

12 MR. IOTTI: All right. Well, I don't have an
13 answer to this question for you. I would like to
14 discuss what the impact of this would be on any of
15 our technical results, because I don't believe it
16 would have any in terms of the lateral capability
17 even if it acts as a restraint, which it would, it
18 would still not impact, because if anything, the
19 gaps are small, and we assume the loads on lateral
20 would be even smaller. There would be some impact
21 on thermal, which had been discussed. So far as
22 the conclusion on our affidavit, that would not
23 change. We may have a different thing that we need
24 to address as to why the sixteenth of an inch of a
25 gap is not there. Did you follow what I said?

1 MR. IPPOLITO: I think that's what John said
2 was he had no problems with your analysis, but the
3 plant apparently does not conform to your analysis.

4 MR. FAIR: Well, I'm not sure that that's the
5 case.

6 MR. IOTTI: What I'm trying to say if we were
7 to analyze, but that I would come out even better.
8 I've made worse assumptions. To me the larger the
9 gap -- when I analyzed it, I analyzed it without any
10 gap. The larger a gap, the more a deflection. What
11 I assume that lateral load is higher, because I'm
12 letting it deflect to a larger portion, so with the
13 gap, there's even less -- I would have even less of
14 a load. The results don't change. His problem is
15 where's the sixteenth inch of a gap.

16 MR. FAIR: Let me say I have two problems. One
17 problem is that the summary disposition motion with
18 it states that there is a sixteenth of an inch gap,
19 that leads me to the conclusion that the sixteenth
20 of an inch gap was in a lateral direction, and there-
21 fore, we were only concerned with eight total sup-
22 ports. We took a sample of the worst two and showed
23 no problem, and I thought it was a pretty good
24 sample. The second is in the basic assumption of
25 ignoring the lateral restraints. Now, if you do

1 have a gap in there and it did exceed the movement,
2 I have no problem with making that assumption.
3 However, if the gap does not exist there, I consider
4 that a bad assumption even if it does not turn out
5 to be a safety problem. I think that was a poor
6 engineering practice.

7 MR. IOTTI: Well, yeah, maybe it was. I'm not
8 quarreling with that, because I don't see any rea-
9 son to go over spilled milk. I mean that has al-
10 ready been made abundantly clear before. But is
11 there an adverse consequence from a bad assumption?
12 The answer is no in any case. I don't necessarily
13 agree with your characterization either when you
14 say the gap is less than sixteenth of an inch. But
15 how much less. Clearly in the case where there is
16 no gap, I may agree with you.

17 MR. FAIR: Let me state I only looked at those
18 supports, those eight, which the movements were
19 greater than one-sixteenth.

20 MR. IOTTI: Total thermal plus seismic. I
21 guess implicitly we agree with you in that instance,
22 it would act as a lateral restraint. Okay. But
23 there is no safety implication for adverse -- you
24 know, implication reversed to safety from that
25 U bolt acting as a restraint. I would like to keep

1 the two issues separate whether the gap is really
2 there or not from the conclusion of the affidavit
3 if I can. If I may from the work that I did, this
4 is my own personal work. From what you tell me,
5 that doesn't invalidate any of this other than the
6 dimensions may not be correct in this particular
7 support. The conclusion would still be the same
8 that there is ample ability of the bolt to with-
9 stand the lateral load that would be imposed on it,
10 in fact the lateral load might even be left less.
11 Secondly, that the stresses on the piping system
12 would not be adversely affected, because we assumed
13 in our analysis that there was no gap.

14 MR. FAIR: You analyzed just the seismic, and
15 at the meeting I asked you why you didn't analyze
16 the thermal, and you said the gap existed.

17 MR. IOTTI: Yes, that's true. The thermal had
18 been analyzed, they had analyzed the thermal.

19 MR. FAIR: They had no sample.

20 MR. VOLLMER: No gap.

21 MR. IOTTI: I have to go back. For some reason
22 this whole section has disappeared from my affi-
23 davit. Do you have the affidavit with you? I think
24 we need to take some time to go find my attachments.
25 They were attached, the table was one, and all of

1 the attachments later, I don't remember the number
2 now, disappeared from my entire package here, so I
3 need to refresh my memory.

4 MR. BOSNAK: I think normal practice would be
5 to do it without a gap. I don't know what they did.

6 MR. IOTTI: Rather than make a fool out of
7 myself and me say one way or the other, I would say
8 no.

9 MR. FAIR: I believe from the last meeting we
10 had determined that those particular analyses may
11 be superceded by some field work.

12 MR. IOTTI: Unfortunately, I don't have the
13 stuff with me. It would seem to me it was probably
14 analyzed without the gap, but I can't assure you of
15 that.

16 MR. FAIR: I would assume that that would have
17 been correct, but as I was saying, I believe that
18 those analyses may be superceded because of some
19 field modifications.

20 MR. IOTTI: That's correct. The prior
21 analysis where the thermal analysis indicated that
22 the restraints -- that the U-bolts would act as a
23 two-way restraint where the thermal expansion was
24 larger, so through that sixteenth of an inch gap,
25 they modified the support.

1 [A short time was had off the
2 record. Thereafter, the fol-
3 lowing proceedings were had.]

4 MR. IOTTI: When we left off, there was some
5 question as to what Gibbs-Hill might have done with
6 regard to some of the analyses with the two-way
7 restraining action of the U-bolt had been con-
8 sidered in determining stresses, independent of
9 that later on, whatever supports had been found
10 constraining the motion was modified. There was
11 also -- I was also to confirm what we had done
12 with regard to re-analysis in the affidavit. And
13 let me add the second portion first in re-
14 assessing typing stresses increased in supports
15 other than those that would act as two-way
16 restraints and also increased in support loads as
17 added to it as would be happening to the supports
18 that act as two-way restraints. The applicants
19 only re-analyzed the seismic portion. And the
20 reason we did so is because it was believed that
21 the sixteenth inch gap or whatever lateral would
22 not effect the thermal analysis at all. So we
23 were interested as to how the seismic load would
24 be effected, seismic stresses, seismic loads that
25 would remain tube support, that's one item.

1 However, in assessing the capability of the U-bolt
2 to take whatever loads might be imparted to it and
3 what margin it would have on that load, I want to
4 again clarify that applicants used the combination
5 of thermal plus seismic. We assumed the total
6 displacement as calculated on the basis there would
7 be no lateral combination of thermal and seismic
8 would be applied, so insofar as a U-bolt on accepted
9 loads, I don't think there is any question in my
10 mind that it is capable of doing so with regard to
11 possible effect of pipe stresses since no analysis
12 has been redone with regard to the effect on thermal
13 if the gap that is supposed to be there is not
14 there. All I could do is go back to some of the
15 initial analyses of the same problem, for instance,
16 problem AB-162E was re-analyzed by applicants for
17 the purpose of the affidavit. It was analyzed by
18 Gibbs-Hill. When Gibbs Hill ran the analysis with
19 the gap as being non-existent to find out what the
20 effect of the restraining action would be insofar
21 as thermal results, the stresses of the equation
22 ten went up to about twenty-five percent, not
23 everywhere, but the highest stresses went up to
24 about twenty-five percent. If you were to take
25 that as being the characteristic of the responses,

1 you would get that you might see that is added on
2 to the stresses, if you were to calculate the
3 normal stresses, just the normal. If you were to
4 do just thermal, it would go up twenty-five percent.
5 Thermal is not a significant portion of the analy-
6 sis, but I haven't done an analysis, so you have
7 to take this with a grain of salt. I did not do
8 the prior analysis, Gibbs-Hill did, so I can only
9 look at their results and attempt to draw conclu-
10 sions from those results.

11 MR. FAIR: I think that we're going to have
12 to get this particular motion straightened out
13 with what actually exists where the applicants
14 designed their sixteenth of an inch gap in the
15 supports and a conclusion on the safety conse-
16 quences.

17 MR. IOTTI: Well, I don't anticipate any
18 problem with that, and it's a short turnaround.
19 All we'll have to do is add the thermal analysis,
20 the same problem again, that is with regard to the
21 safety issues, with regard to why the gap that's
22 shown on the drawing is not there. I consider
23 that a separate issue.

24 MR. FAIR: Let's get that straightened out.
25 I happen to have all the drawings with me. The gap

1 that's shown on the drawing in the direction of the
2 restraint. I have gone and essentially confirmed
3 that that gap does not exist in the direction of
4 the restraint. The concern here, of course, is
5 not the restraint, but the unrestrained direction.
6 And I have measured various gaps from practically
7 zero to slightly above a sixteenth of an inch
8 total on each side. You may want to reconfirm
9 that by your own measurements, but it wasn't very
10 easy to do on some of those supports.

11 MR. IOTTI: I think the most straightforward
12 way is for us to assume there is no gap and tell
13 you what the consequences are.

14 MR. FAIR: I also have to conclude that it
15 would have been appropriate whether or not this
16 turns out to be a safety concern, it was an
17 inappropriate assumption not to assume that these
18 supports provided lateral restraint. There was
19 no basis for making the assumption.

20 MR. IOTTI: I guess I would have to agree
21 with you for that fact that they were also intended
22 not to have any gap. The conclusion is fairly
23 inescapable.

24 MR. WADE: According to John Byner that I
25 just talked to, he said that's intended for there

1 to be a restraint rack on the drawings.

2 MR. IOTTI: He's talking about unrestrained.
3 These confirmed that that is not the problem. The
4 problem is the other. Okay. I guess we'll have to
5 modify the affidavit to reflect that new analysis.
6 That's a short turnaround. We can have that done
7 by the end of next week. That's not the problem.
8 The other part, I guess I have to talk to some
9 more people here why it's not there and why the
10 drawings show it as such.

11 MR. FAIR: I want to reiterate the gap as
12 exists as shown in the drawings.

13 MR. IOTTI: Your question is why do we say
14 there was no restraining action where it wasn't
15 supposed to be? Yeah, I think it's a point we
16 have to address clearly. It was obviously our
17 understanding that it was, we would have never
18 written it otherwise.

19 MR. IPPOLITO: I would appreciate you reviewing
20 those drawings.

21 MR. IOTTI: Well, we'll do so, you can rest
22 assured.

23 MR. IPPOLITO: As a double check, because if
24 we are wrong, I would like to know we are wrong,
25 but, you know, we will look at those drawings, and

1 if they are the correct drawing and all that shows
2 that its dimensions not given.

3 MR. IOTTI: We understand your point, and we
4 will address it. Does the approach we have out-
5 lined satisfy you? Same problems, give you the
6 results drawing the same conclusions as we did in
7 the affidavit plus the question of the drawings
8 and the appropriateness of making that assumption.

9 MR. FAIR: Yes.

10 MR. IPPOLITO: Is there another agenda item?

11 MR. BURWELL: I believe you wanted to get a
12 status report on the original insert information,
13 is that true?

14 MR. IOTTI: Well, again, I don't have all the
15 answers, but I've got enough, I think, that I can
16 give you a status report on it.

17 MR. BURWELL: I just wanted to clarify that.
18 The next item that we are discussing is the
19 applicants' motion for summary disposition regard-
20 ing the design of Richmond insert and the applica-
21 tion to support design. This motion was filed with
22 us on June the 2nd, 1984.

23 MR. IOTTI: As we left the meeting of the 8th
24 and 9th, we had agreed upon a set of action items.
25 Applicants were supposed to provide additional

1 information to the staff. One of the items we
2 don't have today, this is the details of the 8th
3 Richmond insert pattern, and I am not in a position,
4 even if I wanted to, to give you the plan on it.
5 That is something that is going to have to wait
6 until John gets back, again our schedule of com-
7 pleting it and getting it by the end of next week.
8 You will have all this. One additional item was --
9 we did go back and the particular elements -- the
10 stresses are computed as are outlined elements.
11 There is a finite layer on the outside. They are
12 not an extreme fiber, on the other hand, it's a
13 fin element. There were two aspects to the
14 question. Whether one should even attempt to
15 derive the bending movement to the finite element.
16 The other one is, of course, where the stress is
17 being calculated. To attempt to answer the
18 question as to why we felt it was necessary to go
19 to finite element analysis. We believed there was
20 sheer contribution to this particular stress
21 pattern in the bolts, it wasn't just pure bending.
22 As I pointed out to you, we had two test cases
23 that were run, one under torsion and the other one
24 under sheer in the field with the tube steel off-
25 set -- the hole in the tube steel offset to the

1 point in one particular instance you could only
2 see pure bending. If you are ever going to get
3 pure bending in the bolt, that's going to be the
4 case. We then looked at the results of the test
5 and attempted to superimpose on those results the
6 loads. The one we calculated assuming pure
7 bending, MC over I , and we did so by simulating
8 the bolt as a simple cantilever and also a guided
9 cantilever, because its behavior as a guided
10 cantilever was a difference of the two between
11 them. Again, these results are fresh off the
12 press, if you will, and they haven't been reviewed,
13 so I'm somewhat hesitant to show them to you. If
14 you look at that particular one, it shows in
15 either case the cantilever, the guided cantilever
16 are not quite full. The loads depicted by the
17 test is higher than what you would predict by the
18 analytical approach using MC over I . That means
19 there's some resistance there. It isn't just
20 bending resistance, that's why we elected to go
21 to finite elements to find out how much of that
22 resistance was due to bending and how much was
23 due to shear. We don't know of any other way to
24 do so other than to do a finite analysis. You are
25 welcome to glance at these results. Again, bear

1 in mind, they haven't even been reviewed, they
2 have just become available.

3 MR. FAIR: I'm not sure what you just told me.
4 You are relying on the load reflection on the test
5 to verify --

6 MR. IOTTI: To verify that there is more to
7 the bolt -- that simulating the bolt as if it --

8
9 [A short time is had off the
10 record. Thereafter, the fol-
lowing proceedings were had.]

11 MR. IOTTI: What I was saying is that as you
12 plot load reflection, you can equally plot move-
13 ment rotation if in fact what you see in the bolt
14 is essentially pure bending, then that bolt
15 essentially behaves as a cantilever or guided
16 cantilever. You should be able to match the
17 results of the test fairly well to the results
18 you have there. If that bolt doesn't behave, a
19 flectual member -- it's a short stout flectual
20 member, as well as both sheer, you have to deter-
21 mine which part is due to sheer, which part is due
22 to flectual resistance. The only way we know how
23 to do that is to find finite element analysis,
24 that's a way of rationalizing where we went to
25 finite analysis of the bolt. We suspected that it

1 was something more than just M over I effects,
2 and the results that we got out of finite elements
3 did confirm that. So we think this addresses the
4 particular action as to why we can reduce the
5 stresses that you would compute from bending if
6 you just use the MC over I approach. That's what
7 I thought was one of the action items that we
8 agreed on, and this will be provided to you as a
9 rationalization. If you don't agree, your next
10 question will be how many more of those supports
11 of table A or B will be added to the number that
12 will have to investigate further. I don't recall
13 the exact number, but it seems like twelve more
14 supports will have to be added, if I recall correct-
15 ly, so we are not talking about a large number, in
16 any case. The third action item is confirmed with
17 the fatigue analysis that we had done included in
18 the affidavit was performed using S836 or had in
19 fact accounted for the high strength bolt. We did
20 go back, and it was done strictly on S836. Now,
21 we have gone back and redone a fatigue analysis for
22 those few high strength bolts. We were also to
23 go back and verify whether in some tube steels are
24 there still instances with the MZ Movement -- the
25 MZ Movement rotating is not being released. And

1 the answer to that is there aren't any MZ Move-
2 ments also released.

3 MR. FAIR: This is current design practice.

4 MR. IOTTI: Well, no. This is something that
5 I don't want to get too much into it, but we may
6 have to modify our affidavit. There was some mis-
7 understanding of what we believe the MZ design
8 people -- the analysis was misinterpreted. They
9 in fact gave us the MZ Movement. The MZ Movement
10 apparently was always released. So that's the
11 information I have as of today, but I haven't had
12 a chance to go back and talk to the people who
13 actually did the analysis, so take that with a
14 grain of salt again. The last time it was -- on
15 providing additional information, the prying
16 action for larger size tube steel, that would be
17 forty-eight inches as opposed to twenty-four inch.
18 Again, I'll give you an unreviewed result, but it
19 appears not to be a problem from the standpoint of
20 prying force, not necessarily the prying action,
21 the prying ratio. Okay. Because ultimately it's
22 the prying force. The six-by-six tube steel with
23 one-inch inserts. We will be providing you with
24 the table that shows the various tube sizes from
25 four-by-four, three and three eighths, all the way

1 to eight-by-eight by a half, and it will show the
2 reaction with or without the end restraints and
3 give you prime factor for each of them. So I think
4 that addresses all of the action items that we
5 agreed upon at our last meeting. As I said, I
6 don't have any information at all on this eighth
7 insert pattern. If you want, we'll try and define
8 it this afternoon and go look at it, but I have
9 got nothing at all with regard to that.

10 MR. FAIR: I think that may be worthwhile to
11 walk out and take a look at it.

12 MR. IOTTI: First, we've got to identify where
13 it is. I haven't the foggiest idea. It will take
14 us some time. Once we identify it, we'll take
15 you there.

16 MR. FAIR: Let me recap on this MZ Movement.
17 If you confirm that your information is correct,
18 it was never modeled as fixed.

19 MR. IOTTI: That's correct, which means that
20 our affidavit makes an unwarranted assumption that
21 the information that we have to be correct or to
22 our best belief may in retrospect turn out to be
23 incorrect, because the analysts were confusing in
24 the MS Movement.

25 MR. FAIR: The other side, there are some

1 longer spans than your typical twenty to twenty-
2 four inches, and the longest is forty-eight inch.

3 MR. IOTTI: The longest is forty-eight. We
4 looked at all different type tube steels to address
5 your question on prying action, and we have that
6 tabulated both in terms of prying factors as well
7 as the prying force.

8 MR. FAIR: And that was done in a generic
9 fashion versus looking at specific supports.

10 MR. IOTTI: Well, it was a combination. The
11 study was done in generic fashion, but what was
12 done specifically is to confirm there was nothing
13 longer than forty-eight. There are some six-by-
14 six-by-three eighths with a one-inch insert.

15 MR. FAIR: I think that's it.

16 MR. IPPOLITO: Just let me ask, this is going
17 to be submitted when?

18 MR. IOTTI: The whole package, everything that
19 we have agreed upon the meeting of the 8th will be
20 turned over to you hopefully by the 30th.

21 MR. IPPOLITO: And this includes the revision
22 of the affidavit, too?

23 MR. IOTTI: Yes, if in fact we can confirm
24 that. You can understand now, I am thoroughly
25 confused, because I investigated that quite

1 extensively and actually sat down with the
2 analysts as we were doing it. I mean, really, if
3 in fact we have to revise the affidavit, the 30th
4 submittal will also include that the end of next
5 week.

6 MR. BURWELL: I believe the remaining part of
7 it would be a visit to the plant to get a look at
8 some of the hangers. I believe those three gang
9 hangers were specifically one of the areas and the
10 vertical hangers that was represented by figure
11 one on page -- or type one on page nine of your
12 affidavit on stability.

13 MR. WADE: Before we leave, we have another
14 action planning going on axial restraint rotational
15 resistance question that we discussed a couple of
16 weeks ago. I am assuming since we are not discus-
17 sing that here, that plan in your mind will solve a
18 plan that will bring that issue to an end or are
19 there other issues there that we ought to discuss
20 right now.

21 MR. IPPOLITO: Let me make this clear, I
22 called a meeting primarily to resolve what I
23 thought were the two significant areas where the
24 staff and the applicants could not converge. When
25 I was briefed last week, when I was back in

1 Washington, these were identified as areas that,
2 you know, we are never going to get there unless
3 something is done, so we came here prepared to do
4 that while we're here. John said that, "Hey, I
5 can clean up one of the areas by going down and
6 looking at this gap." So that's the reason why,
7 you know, we included on the agenda, and I don't
8 know whether we're prepared to talk about anything
9 else or not. Staff, tell me we're not, and we'll
10 cut it off right here.

11 MR. FAIR: We're not.

12 MR. BURWELL: We're not on the other, so in
13 answer to your question ---

14 MR. IPPOLITO: In answer to your question, I
15 don't know if we've got a problem, but it wasn't
16 presented to me as a problem that I had to, you
17 know, focus on.

18
19 [A short time is had off the
20 record. Thereafter, the fol-
lowing proceedings are had.]

21 MR. IPPOLITO: We have agreed that we will
22 tour the site at two o'clock, and that will close
23 the meeting up.
