1 just establish the first full item that I have got,
2 okay. We will get around to the stability and a number
3 of the others.

4 MR. FLECK: Spot, should I announce who I am?

5 MR. BURWELL: Yes, if you would please.

6 MR. FLECK: I am Hank Fleck from E-Tech. I
7 have some general and also some specific questions on
8 the U-bolt. Why don't I just go through them, and the
9 ones that are general can be provided later with some
10 answers or whatever. The specific ones, we can address
11 as we go along. Turning to the affidavit portion of
12 ascension data U-bolts, page 11, the A36 carbon steel
13 will relax to a state where at preload stresses will be
14 approximately 1/2 yield. In the report, I really have
15 not seen any material data specific to this material
16 that identifies how the material reacts. I would like
17 to get some clarification, either with tests or
18 analysis of the material itself that shows the
19 relaxation is approximately 1/2.

20 MR. IOTTI: There are no, you know A36 is kind
21 of, the garbage in the news.

22 MR. FLECK: Right. I tried to find some
23 livelihood reports and I didn't...

24 MR. IOTTI: The only data that I was able to
25 find, I brought it along for another reason, but I

BH
NRC-106
T-1
3

1 happen to have it with me. I went back. There is a
2 calculation from the STM60. I'm sure you are familiar
3 with this document, okay. There are several materials
4 in this calculation which have properties which are
5 similar to A36 steel, in fact, they could well be A36
6 steel as far as I know. Out of this whole table, there
7 are about five or six of them, that are very close to
8 the specification that STM puts in for the calculation
9 of the properties of A36.

10 Unfortunately, the data is scant, and we have
11 talked to a lot of the materials experts on that also.
12 We have got from them that there is simply not much
13 data available with relaxation of A36.

14 MR. FLECK: I ran into that same problem.

15 MR. IOTTI: So, what I did was went back and
16 found anything that could be as close as possible to
17 A36, and I found material number 2 here is about as
18 close as I can make it.

19 MR. BURWELL: May I interrupt, would you move
20 the mic over closer to you?

21 MR. IOTTI: I am quoting a particular document
22 right now which is entitled Calculation of Stress
23 Relaxation Data for Engineering Alloys. It is ASTM data
24 series publication DS60. This document is rather large,
25 but the only section that is of concern here is the one

1 that pertains to carbon steels. What this shows is that
2 there is very little data applicable to A36 type
3 steels, but there is some. In particular, as you look
4 through this calculation at or near room temperature,
5 it certainly would be below the 4/10's of the nothing
6 temperature of the material which is kind of critical.
7 We have certain material which exhibit a loss of
8 stress, I should call it. We will approximately have
9 within the first hour, after being strained to 2/10's
10 of yield, not to 2/10's yield of the percent, which
11 is...strain constitutes to yield.

12 We believe this characteristic exists because
13 of any material in this relaxation is really micro
14 strain relaxation conversion from lasting to, you know,
15 lasting type strain which occurs as you go through the
16 proportional limit someplace along the U-bolts. Okay,
17 it is not universal to any other U-bolt, but because of
18 that, and because of the way that these stresses are
19 measured, you, in fact are reducing stresses from
20 strained measurements. That can lead you to a, to the
21 kind of a conclusion that you are nowhere near the
22 proportional limit would in fact, at some locations of
23 the U-bolt you have exceeded the proportional limit of
24 the material. You may be cycling back and forth to that
25 proportional limit and this is what is causing some of

BH
NRC-106
T-1
5

1 this relaxation.

2 This material was not cycled in loading, this
3 material number 2 that I am referring. So, this
4 was uni-axial strain, and it was strain to 2% of the
5 strain, 2/10's of a percent strain. It exhibited a loss
6 of stress to about half of its original value in the
7 first hour. After ten hours, it was essentially still
8 at the same point.

9 MR. FLECK: Do they also include maybe what
10 the key facts that you made, or may not lose from the
11 fact that you are relaxing?

12 MR. IOTTI: Well, there is no mention of that.
13 I did find another material, material 20 which was
14 cycled. Now, the problem with material 10 is it will
15 cycle at a temperature of about 900 degrees Fahrenheit.
16 Nevertheless, the cycle did not seem to have as
17 profound an influence in strain. That is why I was let
18 to believe why we wouldn't have much of a problem. The
19 other thing, is we did do cyclic testing here, so we
20 can make some conclusion from that.

21 Let me get ahead of myself. One of the
22 reasons I ultimately believe in this half of a yield is
23 for the seismic tests that we have run, full seismic
24 tests, originally they have come back to me telling me
25 they had loaded 7,000 lbs. That 7,000 pounds would have

C-106
1

1 been just about half of the stresses calculated. You
2 know, on a linear basis. They were affording me about a
3 10-15% relaxation. I can't beat. The fear is shot. Are
4 you sure you have that. We confirmed that the load, in
5 fact was 8500 lbs., and that is where you get the
6 10-15% relaxation. So, there is some additional
7 evidence to us. This material behaves almost like a 3
8 or 4 type stainless steel.

9 MR. FLECK: I wonder, could we get some
10 documentation on that for the amount that you have?

11 MR. IOTTI: Sure. I can send you the whole
12 history. I can send you the original data from
13 Westinghouse which afforded 7,000 lbs. What you see
14 here is actually the revised data that was prompted by
15 my question to them. I said, look. It can't be right.
16 If I am correct, you can't be. And, as you see, the
17 data was then subsequently changed and they found the
18 load to be much higher.

19 So, there is no hard and fast evidence of
20 that. On the other hand, we also ran to make sure,
21 because we couldn't understand some instances why were
22 getting relaxation, for instance, on the load of the
23 U-bolt. If the U-bolt stays totally elastic, don't
24 exceed the proportional limits, why should we have a
25 relaxation. We ran a finite element analysis, just do

BH
NRC-106
T-1
7

1 the free load, where the U-bolt modeled as elastic
2 elements as well as the pipe.

3 As it turns out, as you load the U-bolt right
4 at the deflection point, your bending stress out of the
5 outer fiber exceeds to proportional limit. Everytime
6 you do so then you load or preload in a cyclic mode,
7 you actually go through the proportional limits; which
8 indicates that that is probably where you are getting
9 the relaxation even though you may be at reasonably low
10 total stresses. This was the curve, the stress strength
11 curve we used for the computer model. We only ran free
12 load. It wasn't something you were aware of, I just did
13 it last week.

14 Essentially, this is how much loading you
15 get. So, when you attempt to cycle about this, you
16 don't start up.

17 MR. FLECK: Right. In most material you will
18 tend to do that. In some materials, you will tend to
19 lose some of the fatigue problem. In other words, you
20 don't get a free ride. Somewhere along the line, you
21 are going to pay for it.

22 MR. IOTTI: Right.

23 MR. FLECK: Do you feel that most of the
24 relaxation is occurring in material? Could some of it
25 be slopped in the threads?

1 MR. IOTTI: There has been some of that for
2 the preload that we have been using in the plan. We
3 don't expect, really, any relaxation.

4 For the type of testing that we did, most of
5 the relaxation was in the material thread, or in the
6 thread. There was one particular test where, in the
7 four inch schedule 160, we actually exceeded yield in
8 the thread area. Clearly, we had a lot of relaxation at
9 that point.

10 MR. BURWELL: A point of clarification...You
11 said, in the material as opposed to the thread. You
12 mean, in the bend of U-bolt as opposed to the...

13 MR. IOTTI: It is eternal to the material. It
14 is actually a conversion of elastic strain the material
15 has into some interelastic strain which does not
16 recover easily. Essentially, you have lost.

17 MR. FLECK: Well, if I read Bob right, he
18 could take a tension specimen and demonstrate the same
19 thing. Unfortunately, this material was something that
20 most people haven't tested. I tried to find data like
21 that in the library that I could say yes, I believe it,
22 or no, I don't have enough data to believe it or
23 disbelieve it.

24 MR. IOTTI: The problem with this material is
25 there is so much of it. It is so different. A36, has

BH
NRC-106
T-1
9

1 got a large carbon spread all the way up to .25
2 percent. You get up in the maganese and the silicon
3 again, you can be up to the 15 percent, or you could be
4 down to as little as .2. Each of these materials
5 behaves slightly different.

6 MR. FLECK: The other thing that you have
7 mentioned now, as you have indicated, in all
8 probability, you don't believe you will be even with
9 the torques that applied will even be close to you?

10 MR. IOTTI: Well, that is correct. You see,
11 the way we ultimately will end up at the plant after
12 the inspection to make sure that the minimums are to be
13 acquired. That minimum torque has been determined by
14 finite element analysis to be high enough to cause the
15 problem of relaxation.

16 So, we have to be careful. We can't be too
17 high in the freeload, because, if we are too high in
18 the freeload the material will relax down to where it
19 wants to be to start with. So, our concern was if it
20 relaxes down to where it wants to be, do we have
21 sufficient preload maintained as pure stability.

22 Our answer, the finite element analysis was
23 the test. We indicated that that would be the case.

24 MR. FLECK: Okay. I guess then, I would like
25 to see two things. One, the limited data you have on

1 that, and also verification that the maximum applied
2 torque would be on the yield under whatever, 90% of
3 yield. So, the question would disappear as far as to
4 whether A2A, or A36 whatever batch you had, whether it
5 was the worst or the best wouldn't really have a
6 concern as far as relaxation because you are never
7 really going to be close to yield.

8 MR. IOTTI: The problem is you do relax if you
9 are not. That is the point that I want to make. In
10 reality, that is not really the case. What is
11 happening, I will use this as an illustration. The
12 typical plot of financial data A36. That is from the
13 Bethlehem Steel. We are due to get some more, but I
14 haven't received it yet, because there is quite a
15 spread. What happened is all the stresses that we
16 deduce here by finite element analysis by test, in
17 particular by test. Make certain assumptions. If you
18 are smart, in the finite element you actually monitor
19 the behavior to proportional limits. So, the finite
20 element turns out to be, perhaps, more accurate than
21 the test. In the test, what is generally done is
22 assumed that the yield strenght is 36,000, and the
23 yield strength by the finish is 2,000 of a percent of
24 strain. So, you can draw the line in between.

25 Then, you deduce you are at half the stress

BH
NRC-106
T-1
11

1 from the strain. From reality, that strain would put
2 you way up to the proportional limit. So, you in fact
3 are getting relaxation before you think you are. One of
4 the reason, one of the reasons this halfpoint comes out
5 is that when you go to the strain that causes the half
6 point below the proportional limit, I mean you are not
7 getting that...

8 When I say half the yield strength, I mean in
9 the neighborhood. It could be 40%, it could be 60%.

10 MR. FLECK: The material, too, could be
11 anything from 36 up to 60.

12 MR. IOTTI: That is correct. In fact, the
13 material number two, the one that I quoted you has a
14 yield strength of about 52. It drops to about 26 in one
15 hour. What I wanted to do, and I didn't have enough
16 data to bring for this meeting. I am still expecting
17 it, and if I get it, I will forward it to you. It is
18 actually plot all of the A36 and show by test if you
19 take the strain that corresponds to half the stress
20 along the true stress strain curve, whether in fact you
21 have billowed the proportional limits.

22 The only theory that I see as holding water
23 is the microstrain conversion from elastic to
24 interlastic. We are not in a crete region, not that I
25 can see. We are at too low a temperature for that. So,

1 this is the only cause that we can think of would make
2 the material relax at those low temperatures and at
3 these low loads.

4 In addition, what I will try to do is, there
5 is actually data from all of the tests, that if you
6 read it in a certain manner will tell you, the material
7 had in fact been stretched over half of the yield. You
8 know, this is relaxed down to where this would again be
9 half a yield. Every one of these tests, where the tests
10 at any point unit was over a half a yield, ultimately
11 that brought...

12 MR. FLECK: That would be good to see then.

13 MR. IOTTI: I'll send that to you. Some of it
14 is in these plots, but they are not that specific.

15 MR. TERAQ: Unfortunately, I guess what Paul
16 was mentioning, do you have enough data there to show
17 the spread so you can get a statistical basis, yes what
18 we have would be a minimum or whatever. I don't know
19 whether with the amount of testing you have done...

20 MR. IOTTI: We have done quite a bit of
21 testing, remarkably in spreading data. Now, we have to
22 be careful now in talking about spreading data. With
23 regard to proving that everytime we see that yield at
24 any point that we experience a relaxation which was
25 proportional to how much over the half a yield we were.

BH
NRC-106
T-1
13

1 We have a fair amount of data. I can all put
2 it on one sheet. Some of it comes from the freeload
3 test, some of it from the thermal cycling test, some of
4 it comes from the seismic tests.

5 MR. TERA0: I would have one question here,
6 now. What means would you have to establish for that
7 particular U-bolt what yield of that A36? So, there we
8 would have a big unknown.

9 MR. IOTTI: That's the bit unknown. There is
10 nothing I can do about it. Well, I may be able to
11 phrase back to the heat of that particular U-bolt
12 through the ITT Grinnel.

13 MR. TERA0: If that is possible, that would
14 be...

15 MR. IOTTI: I think we can do that. We think
16 the yield is around 42, this material. We asked, but we
17 don't actually have the data.

18 MR. TERA0: Is that ascertainable material?

19 MR. IOTTI: Yes.

20 MR. TERA0: So, you could go back to ITT and
21 have them ascertain, tell you what potential is allowable
22 in the yield.

23 MR. IOTTI: That is correct.

24 MR. TERA0: We would need that for a base.

25 MR. IOTTI: None of these are NPSI's. The ones

C-106
1

1 that we tested, none of them were, they all came up
2 from ITT, right?

3 MR. TERAQ: They came from the site.

4 MR. IOTTI: But were they provided by ITT?

5 MR. TERAQ: I don't know. We have the data.

6 MR. FLECK: I just have one question. When you
7 mentioned the variability in the carbon content, I
8 believe you said it varies from about .2 to .8%.

9 MR. IOTTI: No. No. Not the carbon. Hold on, I
10 can tell you. ASTM specifications give you certain
11 limits. Carbon can be a maximum of .26 percent. BUT, it
12 could be as low as .04. Maganese can go as high as .8,
13 and silicon, again, can be as high as .15. Anything in
14 between can be construed to be 36 type material. In
15 addition, there are other impurities that are
16 permissible. So, it is truly garbage material. I think
17 that is one reason why very little data is available,
18 when you test. You test this A36 with the next A36.

19 MR. FLECK: I don't know whether I would
20 characterize that as garbage material or not. I think
21 there is a problem with this particular non-headed bolt
22 that it originally was formed under the A307 spec, and
23 then for under the A307 spec which I would characterize
24 more as a garbage spec and A36 for non headed bolts
25 then he said for anchorages would have to be

BH
NRC-106
T-1
15

1 requalified for A36, which has much more requirements
2 say or tensile tests or chemical requirements than
3 A307.

4 MR. IOTTI: Well, when I meant garbage. You
5 are right, I shouldn't use that word. To me the
6 material has so much variability. It is almost
7 impossible to test on a global manner to determine what
8 it is going to test aside. Because you would have to
9 essentially test every chemical composition.

10 MR. TERAQ: Why do you say this was made for
11 A307?

12 MR. FINNERAN: A307 is the base expect for
13 bolts.

14 MR. TERAQ: Not bolts, U-bolt material.

15 MR. FINNERAN: I couldn't hear what you were
16 saying.

17 MR. FINNERAN: A307 is the base expect for
18 bolts. There is also the requirement, A307 for
19 non-headed bolts which need upgraded to the tensile and
20 chemical requirements of A36.

21 MR. FINNERAN: Our U-bolts, I don't think are
22 made from a bolt spec. They are made from A36 rod. They
23 are not made to a bolt spec. It is an A36 rod that has
24 been threaded and formed to a U-bolt shape.

25 MR. TERAQ: In either case, whether they were

1 formed, I guess I was think in terms of the Richmond
2 inserts also. They have A36.

3 MR. FINNERAN: No. That is A36 rod that has
4 been threaded also.

5 So, neither the notes in the Richman inserts
6 or he U-bolts are made to an A307 spec.

7 MR. TERAQ: I just noticed there was some
8 confusion in the record about the difference between
9 A307 and A306. I thought maybe we could clarify that a
10 little, maybe we have to some extent.

11 MR. IOTTI: There is really no difference in
12 material per se. It is more a difference in
13 requirement.

14 MR. TERAQ: A difference in testing, right.

15 MR. BURWELL: Off the record a moment.

16 (Off the record discussion.)

17 MR. FLECK: Okay, well I don't have anything
18 further until we get some data to look at. This is Hank
19 Fleck again from E-Tech. Dave, the next question I have
20 is on page 25 and 26 here, unless Dave has got some
21 questions prior to that.

22 MR. WADE: No.

23 MR. FLECK: I guess I am a little confused on
24 one thing when you read the deposition and then you go
25 back to the finite element or the test data trying to

BH
NRC-106
T-1
17

1 see how the statements relate to facts. Here is one
2 area that I really got a little confused, I guess. In
3 my crete test. This indicates that crete is not a
4 problem, yet I look at your test data in figure 25, and
5 it shows for 24 hours the U-bolts lost a preload of
6 1-2% Well, that is hard to believe that crete is not a
7 problem. In one day you lose 1%. This is primary crete,
8 and the secondary crete would have a different rate.
9 But, not knowing what the primary and secondary crete
10 rates would be for this material, just taking that one
11 percent in one day, that means in 100 days I have lost
12 all preload just through the crete.

13 So, I dispute that crete is insignificant
14 when the test results and the party who reported it
15 shows 1-2% loss.

16 MR. IOTTI: Okay. Did you look at the next
17 figures on the one that was also heated up at the same
18 temperature and shows, in fact that it gains strength?

19 MR. FLECK: The next one, let's see. Let's
20 take a look and see.

21 MR. IOTTI: I guess you are referring to
22 figure 25 which is 4". If you look at figure, and it's
23 true for the 4".

24 MR. FLECK: Okay, let me preference one thing
25 Bob. Four inch, the hottest one. The next one for the

1 ten inch is around 180,200. I wouldn't expect anything.

2 MR. IOTTI: Given the fact that I am talking
3 about the U-bolt temperature at 250, 32" carbon steel.

4 MR. FLECK: There I have a question. What do
5 you mean by apparent strain? In other words, were these
6 strain gauges temperature compensated?

7 MR. IOTTI: Yes, they were.

8 MR. FLECK: Then, I kind of look out at the
9 test for the 32" and I can't make head or tail of it.

10 MR. IOTTI: That's a problem too.

11 MR. FLECK: Something was lost there.

12 MR. IOTTI: The system has variability.

13 MR. FLECK: I don't know whether the gauges,
14 whether the gauges were lost to get a statistical
15 analysis to get a max/min, that is fine. But, for crete
16 tests it doesn't show me anything. So, I go back to the
17 four inch pipe which definitely shows a trend. Now,
18 again, not having enough basic data on A36, I would
19 assume if it is a reasonably good carbon that crete
20 wouldn't occur until about 5-550.

21 Now, I look at A307, basically that is cut
22 off in the ANSI B31 at 400, which said crete has
23 probably occurred after that.

24 MR. IOTTI: Well, we obviously owe you more
25 explanation than this one. The reason we made the

BH
NRC-106
T-1
19

1 statement, and we will have to get to some of the raw²⁰
2 data. We believe what caused this load was the
3 relaxation and not crete.

4 MR. FLECK: And not crete? Okay, I would have
5 to look at...To do a crete test in 24 hours doesn't
6 really show you anything. I would expect you would have
7 to do a crete test for a month if you wanted to find
8 it.

9 MR. IOTTI: We had a problem with that, of
10 course. The problem with that is simply enough, we
11 didn't have 6 months to do it.

12 MR. FLECK: I understand that, and I will say
13 that for the time you had it, I think you put out a
14 reasonably good report, but there are some conclusions
15 you are drawing from it that I can't buy. That is one
16 of them.

17 MR. IOTTI: Okay. I guess I will have to give
18 you more data to enable you either to conclude with us
19 we are correct or definitely say you guys don't know
20 what you are talking about.

21 MR. FLECK: Yes. For the ten inch, I wouldn't
22 expect to see any load. Because the temperatures, when
23 you are in the 400 degree piping area, I have concern.
24 I would like to get some more backup on that.

25 The other thing, what are your nuts on that?

1 Are they 307 material? They would tend to start
2 relaxing at 400 degrees, crete?

3 MR. IOTTI: I don't remember what those were,
4 I will have to check.

5 MR. FLECK: I think you owe us a little more
6 than to agree with you or disagree with you. That is
7 not enough to really conclude much test.

8 MR. IOTTI: Let me make a note here to check
9 on the material on the nuts.

10 MR. FLECK: If it did become a problem, then I
11 come back to maybe you need inservice inspection. That
12 would take care of your problem. That is what you would
13 hang your head on.

14 MR. IOTTI: That is not where we are hanging
15 our hat. Crete is not a problem. Would you give us that
16 for the time being, that that is the result, and then
17 ultimately we will be able to mention that this
18 business of relaxing to this half is not required.

19 MR. FLECK: Right. But, until we have enough
20 data to reasonable conclude that, I don't think at this
21 point we could agree with you that this inspection is
22 not required.

23 MR. IOTTI: We are in the process of putting
24 together more elaborate.

25 MR. FLECK: I realize that your time span is

BH
NRC-106
T-1
21

1 very condensed.

2 MR. BURWELL: Do you find a submittal on
3 preservices, I mean in-service inspection?

4 MR. IOTTI: No.

5 MR. BURWELL: Pre-service inspection, I guess.

6 MR. IOTTI: No.

7 MR. FLECK: I am going to, until this is
8 resolved, request for a service inspection. If this is
9 resolved, then that would disappear. If not, there
10 would be an in-service inspection requirement and the
11 timespan for it would have to be decided whether it is
12 a year, eighteen months, or six months, and for what
13 temperature pipes that this would be required for.

14 Then, I switch to page 59, and I believe,
15 that is a typo. So, we can eliminate that very quickly.
16 Your table asks for the 32" mainsteam. The allowable of
17 1.5S, 13KSI. I don't believe that is correct.

18 MR. BURWELL: That is on page 59?

19 MR. FLECK: Fifty nine of the affidavit.

20 MR. IOTTI: No. That is a typo.

21 MR. FLECK: Again, when it came to an obvious
22 typo, I put it down. That is no big...

23 MR. IOTTI: When we take a break, I will go
24 back to the original stuff and see if I can find the
25 acutal value.

1 MR. FLECK: I guess I am really confused what
2 the 29 is there too. That might be part of the typo
3 too.

4 MR. IOTTI: Which one?

5 MR. FLECK: The 32SM29.

6 MR. IOTTI: Mainsteam?

7 MR. FLECK: Yes. What the 29 represents. There
8 is no standard gauge for it. I think that is a typo
9 also.

10 MR. IOTTI: Maybe that was the allowable?

11 MR. FLECK: Yeah. I think that is right. You
12 might want to verify that.

13 MR. IOTTI: I don't know how that 13 got in
14 there. I brought most of the original stuff with me
15 just in case.

16 MR. CHEN: At the top of page 126, 29.1.

17 MR. IOTTI: The 29 has got to be the
18 allowable.

19 MR. FLECK: Yeah. I think 29 is the allowable.

20 MR. IOTTI: What I am puzzling is where the 13
21 came from.

22 MR. CHEN: 13.26 which is the SM divided by
23 29.1.

24 MR. IOTTI: .13.

25 MR. FLECK: Again, I don't think it is any big

BH
NRC-106
T-1
23

1 concern, it was an obvious, and it didn't look like it
2 was correct.

3 On attachment 2, then, page 4 and 5, the same
4 thing as before on the crete test. I would like to
5 get...

6 MR. IOTTI: Attachment two...

7 MR. FLECK: Item E. I had that problem too,
8 when you guys were on the phone flipping back, Monday.

9 MR. IOTTI: Okay. Statement of material facts.

10 MR. FLECK: Okay. That is the crete tests, and
11 that tied into what we said before. So, additional
12 data. Okay, on page 7 of that attachment, I guess in
13 reading all of this, I am still wondering when I read
14 it, and I keep going through it looking for certain
15 items. I don't see anywhere where it is spelled out
16 what the minimum freeload requirement would be to keep
17 the cross bar with enough friction to keep it stable.

18 MR. IOTTI: Well, I believe we gave you
19 some...Well, first of all, we have got to define
20 stability. We are getting ahead of ourselves. When we
21 talk stable here, we are talking stable in the truest
22 sense. The U-bolts and bark, friction holder...For
23 that, I think we provided some figures in the affidavit
24 of he minimum freeload for the pipe size, for instance,
25 which were tested and analyzed. I believe for the 4" it

C-106
1

1 was 25 foot pounds. For the ten inch, would believe
2 after all of this time I don't remember. I can't
3 believe that.

4 I thought I had this memorized by now. Twenty
5 five, fifty foot pounds for the 10" and 250 foot
6 pounds, that is on page 74 of the affidavit.

7 MR. FLECK: As I say, I went back and forth.

8 MR. IOTTI: Well, it is understandable where
9 you may miss one here or there.

10 MR. FLECK: I see 25 foot pounds. Now that is
11 the value that the mechanic is talking to, right?

12 MR. IOTTI: No. This would be the minimum
13 value that we will make sure exists in each, in the
14 U-bolts.

15 MR. FLECK: So, these values in Table T
16 represent the minimums.

17 MR. IOTTI: This would be the minimum, not
18 that they are not there now, but they would be the
19 minimum after we get through with our pre-service
20 inspection in torquing up. Now, there was also a table
21 2, I believe. Letters and tables, we should be totally
22 confused now.

23 MR. FLECK: It is around 25 or 24.

24 MR. IOTTI: No. That's...Right here. Right
25 after, keep going to the end of that would be Table 1.

BH
NRC-106
T-1
25

1 Those represents the torques that are present now in
2 the field. There are some instances, that you can see,
3 where the torques are below the minimum value.

4 MR. FLECK: For the 4"?

5 MR. IOTTI: Seven and one half. In those
6 instances it is possible for you to have a seismic
7 event that the U-bolt and the bar would rattle. We have
8 had that happen to us in the test. But, it also still
9 carried the load which is really the function of the
10 support.

11 MR. FLECK: I guess we are committed to make
12 sure it doesn't rotate, even though we don't want to
13 get back into...

14 MR. IOTTI: Well, I'm not so sure that that
15 commitment was ever made. We are committing right now.

16 MR. FLECK: You are. You are retorqued to 380.
17 That it shouldn't rotate...

18 MR. IOTTI: That is a commitment that we are
19 making because we think it is a hell of a lot simpler
20 than trying to fight it, okay.

21 MR. FLECK: Yes, I agree.

22 MR. IOTTI: But, we don't necessarily agree
23 that it is necessary. We just committed to do it.

24 MR. FLECK: Well. Now that you are committed
25 to do it though, I feel that it is my responsibility to

1 make sure you have established minimum torque values as
2 well as maximum torque values to accomplish one not
3 exceeding the one half a yield, and also providing
4 enough frictional force to prevent it from yielding.
5 That is what I was concerned with there.

6 MR. IOTTI: So minimum values were quoted to
7 you.

8 MR. FLECK: In table P, in this I guess they
9 were established probably through the finite element.

10 MR. IOTTI: A combination of the finite
11 element and the test.

12 MR. FLECK: These were reasonable minimums and
13 not the absolute minimums. You can go through an
14 iteration in the finite elements.

15 MR. IOTTI: In some instances, it may actually
16 differ. We have got down as low as nine pounds minimum.
17 We said it could be stable, but the test said hey,
18 maybe we ought to stay around 25. The reason for that
19 is, we have noted that testwise, for instance we were
20 always stable when the U-bolt would contort well.

21 At 25, we were getting the perfect contort,
22 so we said we are going to use 25, regardless of
23 whether the finite element tells us nine.

24 MR. FLECK: So, table P would be a minimum.

25 MR. IOTTI: We're talking conservatism.

BH
NRC-106
T-1
27

1 MR. FLECK: When the fellow in the field
2 torques, he is going to be given a max and a minimum in
3 tolerance to establish.

4 MR. IOTTI: We have given, to the best of our
5 knowledge, we haven't established that it is going to
6 be done. I believe it is going to be given the minimum.
7 You cannot be below the minimum.

8 MR. FLECK: Okay.

9 MR. IOTTI: I don't think it is necessarily
10 going to be given the maximum.

11 MR. FLECK: So the minimum would have a 10%
12 allowable for the field person torque?

13 MR. IOTTI: The reason that we don't perceive
14 it is necessary for us to specify maximum is from a
15 sample you will notice we have had no guerillas out
16 there, literally, in torquing this thing way up. Even
17 if there may have been a guy who took it, it has
18 relaxed back down to where we wanted it to be anyway.

19 MR. FLECK: Well that depends on, again,
20 getting more data on A36, and if it does relax and
21 damage due to fatigue is insignificant, then the
22 minimum value is the one you want to put the tolerance
23 above. I would agree with that.

24 Okay, then the next question I would have
25 would be in your attachment 3, the finite element.

1 MR. IOTTI: Yes.

2 MR. FINNERAN: On page 11, figure, Roman
3 numeral III-1, it shows .75 thickness, but in the
4 enclosure for what the certified drawing Rev
5 3RC-1-018-016-GCB/R, it shows a quarter of an inch
6 thickness. I would like to have some justification of
7 why the difference.

8 MR. IOTTI: Those were actual measurements
9 taken in the test.

10 MR. FLECK: Yes, but the drawing says it
11 should be a quarter of an inch.

12 MR. IOTTI: Which drawing?

13 MR. FLECK: That's the drawing for the four
14 inch, the one that was included in the submittal. You
15 will see where I have yellow lined. Now, is the
16 certified drawing correct? If so, the tests would have
17 to be redone. Or then, is the certified drawing wrong?

18 MR. IOTTI: Why should the tests be redone.
19 You are jumping to a lot of conclusions. First of all,
20 what are we trying to establish in the test?

21 MR. FLECK: Okay.

22 MR. IOTTI: First of all, what we wanted to do
23 was make sure the finite element matched the test,
24 because that is the only way you can correlate the
25 bolts.

BH
NRC-106
T-1
29

1 MR. FLECK: Right, agreed.

2 MR. IOTTI: We are not saying that that test,
3 in order to find that element are representative of
4 every support in the plant has a four inch U-bolt.

5 MR. FLECK: Alright. If the cross piece is a
6 quarter of an inch in stiffness you had between the
7 pipe and the U-bolt and cross beam is going to change
8 immensely unless your freeload is going in the pipe. I
9 was led to believe, I guess, that was the enclosure
10 here. Therefore, I would assume all four inch
11 scheduled pipe are a quarter of an inch thick for the
12 crossbeam.

13 MR. FINNERAN: I think we might have an error
14 in his drawing or something.

15 MR. FLECK: I would probably agree with you.

16 MR. FINNERAN: We do not have a quarter inch
17 plate on the this torque for that.

18 MR. FLECK: I guess then, I would come back to
19 say what does, then a certified drawing really mean?
20 This comes to another question, I guess.

21 MR. FINNERAN: I think you may have a bad
22 drawing, would be my first guess.

23 MR. FLECK: I would probalby agree with you,
24 but I would like to have that verified, tracked.

25 MR. IOTTI: We can verify what the minimum

1
2 plate is. It was high, I believe it was 3/4, but I just
3 don't want to jump to the conclusion tat all of them
4 are 3/4 for the 4".

5 MR. FLECK: Yeah. I don't want to have to
6 jump to that conclusion either, and this leaves me to
7 believe maybe, then, the certified drawing is
8 incorrect. But then, it also brings out a question in
9 my mind, I say, are all four inch pipes standard for
10 the pipe plant U-bolt, or could some of them be a
11 quarter.

12 MR. IOTTI: No. They are not.

13 MR. FLECK: That we would need some
14 verification for.

15 MR. IOTTI: Nor are all 4" pipes schedule 160.

16 MR. FLECK: I agree. I kind of expected the
17 drawing to agree with the test though. I guess that was
18 my first subtelty.

19 MR. IOTTI: This is not right. It should be
20 3/4.

21 MR. FLECK: I used the magnifying glass too, I
22 thought my eyes were wrong.

23 MR. IOTTI: Well, the drawing is obviously
24 wrong here because we measured that just to make sure.

25 MR. FLECK: Well, my concern would be what is
in the field, what you have tested and what finite

1 element model is represented as one thing, what is in
2 the field is...

3 MR. FINNERAN: Well, actually we have the
4 clamp mechanism fabricated from this drawing.

5 MR. FLECK: Then it was done wrong.

6 MR. FINNERAN: You have a bad drawing, that is
7 all.

8 MR. FLECK: Well, then I would wonder what the
9 drawing system is really doing to you guys.

10 MR. FINNERAN: No. I just think you have a
11 drawing that was copied badly, or something.

12 (Pause)

13 MR. FLECK: Okay. Then on page 21, it looks
14 like another slight error there. The figure 4, Roman
15 Numeral IV-3 shows the strut attachment 90° from what
16 the drawing MS-1001-005-S72R. I think that is
17 insignificant.

18 MR. IOTTI: That is in fact, the strut got
19 attached the wrong way. My recollection is in the field
20 and in the test.

21 MR. FLECK: Then, I would, I think for your
22 test it makes a small difference but...

23 MR. FINNERAN: It was intentional for him to
24 allow him to use the mechanism test.

25 MR. IOTTI: Otherwise, the test.

1 MR. FLECK: I guess what you are saying is the
2 drawing is right but in order to get the test fixture
3 in you had to change it.

4 MR. FLECK: Okay. No problem. I was just
5 curious after seeing the other just what the problem
6 may have been.

7 MR. IOTTI: In the finite analysis we tried
8 to...

9 MR. FLECK: I don't think it would make any
10 significant difference one way or the other. I was just
11 curious why the drawing and the test were different and
12 that explanation was adequate.

13 Okay, on page 29, I think I know what you
14 mean but I would like to get a further clarification
15 just so I am thinking the same path that you are. When,
16 the preload was, excuse me. That is the preload
17 cynching due to U-bolts, due to torque on the U-bolts.
18 This was done by imposing a negative temperature on the
19 U-bolt which resulted in the shorting of the lathe.
20 This then, how do you accomplish it physically in the
21 program? Did you shorten it by alpha delta pi?

22 MR. IOTTI: Yeah. You actually put it in and
23 the program does it automatically. There is an
24 eternal program within the temperature of the U-bolt.
25 There is two ways you could do it. You could largely

BH
NRC-106
T-1
33

1 apply the load.

2 Westinghouse said this worked. We tried it,
3 but independently, we get the same answer.

4 MR. FLECK: So, actually, if the program would
5 just take alpha delta ti it would do it. I kind of
6 thought that, but I wanted to...

7 MR. IOTTI: The key here is you only want to
8 do it in the straight portions. Otherwise you get
9 fictitious answers.

10 MR. FLECK: Yeah. You get an radio that really
11 doesn't correspond.

12 MR. IOTTI: We ran independent tests upon the
13 loads just to make sure that Westinghouse was totally
14 right.

15 MR. FLECK: So, within the NASTRAN printout,
16 you could see physically that you were in the axial, or
17 straight portion of what the axial preload should have
18 been?

19 MR. IOTTI: Yes. As a matter of fact, it was
20 tuned to make sure that it matched the preload of the
21 tests so we could correlate it.

22 MR. FLECK: Okay.

23 MR. IOTTI: Don't be surprised if the
24 agreement on the preloads is so spectacular to be good.

25 MR. FLECK: Well, that is true. And, in order

RC-106
1

1 to understand some of it, I have to know how the
2 boundary cases of this particular case are put in. That
3 was one thing that I just wanted to get clarification
4 so I would know how in tune or how tuned it was, and
5 how close it should be.

6 Okay, page 42 I had a question in the same
7 area here. I guess what I had a question or hard to
8 accept is the statement where it says stresses measured
9 in the test and calculated for the 32" pipe crosspiece
10 and U-bolt are comparable,

11 MR. IOTTI: Comparable.

12 MR. FLECK: Comparable, rather. I guess
13 really, in looking at the results of the 32" pipe I
14 would say that they are the worst that I have ever
15 seen. Things don't correlate very well with span gauge
16 and test. The other pipes do, and I just can't buy that
17 statement, I guess. The 32", you explain, you did have
18 problems in the fabrication received. So, I just look
19 at that statement adds no meaning to the test results.
20 I just take issue with that statement being due to the
21 fact that the 32" hardware...

22 MR. IOTTI: Do you take issue with the fact of
23 the stresses alone?

24 MR. FLECK: No. I do not.

25 MR. IOTTI: That's maybe, we put it in other

BH
NRC-106
T-1
35

1 words. What we wanted to get across is hey, they are so
2 low.

3 MR. FLECK: Okay, I guess the word is
4 compatable then.

5 MR. IOTTI: We wanted to make sure that it
6 wasn't a failure of the strain gauges that causes the
7 low stresses in the test. The finite element analysis
8 predicts the same thing, that they are very low.

9 MR. FLECK: Yeah. I think it was worded that
10 way. I wouldn't have taken any issue. Just a
11 clarification of when you look at the test data it
12 doesn't really give you that same fealing. They are
13 small, we will definitely agree with that.

14 Then, starting on page 54, where the ground
15 work is layed for what the allowable stresses would be,
16 either I didn't take enough time or I need further
17 clarification of equasion 9 and 12 equal to 3SM.

18 MR. IOTTI: Would you like to explain what you
19 mean by clarification. What you are driving at?

20 MR. FLECK: I went from 54 on to the numbers.

21 MR. FLECK: There are two methods, as you
22 represent here.

23 MR. FLECK: I may have gotten lost in the two
24 methods, to be quite frank with you.

25 MR. IOTTI: The problem is that the code does

1 not provide the right guidance. So, we are to invent
2 some new acceptance criteria. There are two ways we
3 could proceed. If you proceed a traditional way, you
4 dump all of the secondary stresses into equation 12 and
5 13, and in fact, since the code doesn't address these
6 local secondary stresses, you ignore them. You pass.
7 Well, what does that tell you? Have you really passed?
8 That is the second approach. We took the standard
9 equation 9, and then all of the secondary stresses.
10 Most of them are secondary into equation 12. The code
11 tells you not to consider them anyhow. Then we said,
12 well what makes sense. What we really want to do here
13 is make sure the material does not fail. We don't want
14 any gross failure or anything that could lead us until
15 possibly a big problem later on.

16 What we elected to do is to take the
17 secondary stresses that are bending secondary stresses
18 and consider them as if they were primary local
19 membrane and put them into equation 9. This is the
20 front part. Because of that, we thought it was
21 appropriate to increase the allowable equation to 3.
22 Because, we felt that this might be building settling,
23 with a one time load. That is why you see in equation
24 12, approach from the 3 years.

25 MR. FLECK: When you use equation 9 this way,

BH
NRC-106
T-1
37

1 would you use the C in the C's in the normal moments in
2 the pipe or would you peak in the C's?

3 MR. IOTTI: This where we used the B and C's.

4 MR. FLECK: I guess there I haven't digested
5 this enough to really feel that we should use the C in
6 the C's for the regular pipe moments with the 3SF, or
7 whether we should use the B. So, again, I have been
8 unfortunate. I have been on jury duty and haven't had
9 time to digest some of the more subtle things here.

10 MR. IOTTI: As you go through these, once
11 again, we are not claiming...We didn't feel it was
12 appropriate for us to say we know better than the code
13 people. So, we took both approaches to make sure that
14 both instances in our own mind they are okay. It is the
15 combination in the both that led us to believe we don't
16 have a problem as opposed to just the first one of the
17 second.

18 MR. FLECK: Well, maybe this might be an area
19 that we have to do more homework too on. But, it may
20 still be an open issue. At this point, I don't think I
21 could stand firm either way. Unfortunately, the numbers
22 that you have provided here, I can't backtrack enough
23 to see what the differences may or may not be. The
24 stress table that you provide in 72 on doesn't...

25 MR. IOTTI: The only way you can backtrack is

1 go back to the normal stresses in the pipes and then
2 change the C & C's. I think I would ask Westinghouse to
3 do that. I would ask them to reuse the C&C one time.
4 They said they were still okay.

5 MR. FLECK: I would probably see it that way,
6 because I get the impression we are doing it both ways.

7 MR. IOTTI: Well, I asked them, because I had
8 the same concern.

9 MR. FLECK: But then, I see only one way and
10 then I see well...I go along with it to a certain point
11 an if you are using equation 9 with primary and
12 secondaries, which you are combining all the effects,
13 well then, the piping moments should have the highest C
14 in the C's to include primary and secondary effects if
15 that were the case. But, as I say, we may have to do
16 more homework on that.

17 MR. IOTTI: One of the reasons too, that
18 ultimately I believe Westinghouse decided to stay with
19 the B & the C's was they weighed the moment was
20 included in the, at the location of the support. It was
21 not by actual stress analysis by Gibbs and Hill, by an
22 equivalent method which was already considerably
23 comparative to the Gibbs and Hill calculation.

24 MR. FLECK: Okay. That would be nice to see
25 the comparison of the conservatism there, because I

BH
NRC-106
T-1
39

1 realize you are not going to go through every pipe and
2 get the true moment at that spot and use it.

3 MR. IOTTI: I believe someplace in here we had
4 included that spot, because I could foresee that
5 question coming up. Didn't I provide a table which
6 actually provides the Gibbs and Hill calculation,
7 maximum calculated...I would have sworn I had.

8 (End of tape.)

C-106

1

1 MR. FLECK: You have a lot of data there.
2 There's a possibility coming back and forth that once
3 I have a point that I want to have a question, it may
4 have been answered later and I missed it when I went
5 back.

6 But I'd like to see a little more there and
7 in numbers so I can really get a feel for just what's
8 happening there. And when I get to page 59...

9 MR. IOTTI: I have those numbers because I
10 actually have the... We asked Gibbs and Hill to go
11 back and search for these type pipes, what the maximum
12 stresses were, bending stresses and, you know, just
13 total stresses.

14 And what we then did, compared those against
15 the ones that Westinghouse had been calculated, these
16 hand calculation or method used in the industries, and
17 we determined that in all cases Westinghouse was being
18 conservative, and sometime by almost too much of a
19 margin.

20 MR. FLECK: Because the other thing I can
21 really foresee here with setting a precedent that I'm
22 not going to put the burden on as far as what the ASME
23 code may or may not consider it, and it would be better,
24 I think we'd have a complete set of data that we can
25 look at, see just how it is.

1 MR. IOTTI: Well, we try not to attempt to
2 set a precedent here, okay?

3 MR. FLECK: Right, I understand that.

4 MR. IOTTI: We said if the code people
5 couldn't come up with anything over many, many years,
6 we weren't going to be able to do that in two months.
7 Nevertheless, we had to do something. We just
8 couldn't say here are our results.

9 MR. FLECK: I agree. The only thing right
10 now, as I say, we may have to do more homework to
11 agree or disagree with you on a firmer ground, and
12 right now I need clarification.

13 I can't really, from what the data is
14 presented here, go one way or the other. I need
15 some more input, I guess, is what I'm saying.

16 MR. IOTTI: I can have... No problem for
17 us to give you the comparison, for instance, between
18 the Westinghouse calculated normal pipe stresses and
19 the Gibbs and Hill. We have... I thought it was
20 included here and I guess...

21 MR. FLECK: It may, and maybe I didn't...

22 CHAIRMAN BURWELL: You will give us that
23 comparison then?

24 MR. IOTTI: Sure. I have it. I may even
25 have it with me.

1 CHAIRMAN BURWELL: Off the record.

2 (Off the record.)

3 MR. FLECK: Okay, this is Hank Fleck again,
4 and I have another question on page 59, and what I
5 would like is to get some clarification for the total
6 stress intensities.

7 I tried to go back to the tables that were
8 presented for the stress summary tables on page 68 to
9 89, but I don't believe there's enough information for
10 me to back track to see how these numbers were obtained.

11 MR. IOTTI: Would it be helpful if we
12 actually gave you an example, how you...

13 MR. FLECK: Yes, it would be very helpful.

14 MR. IOTTI: ...go from one to the other?
15 Okay.

16 MR. FLECK: And on that same page then, I
17 would need an explanation on how those total stress
18 intensities were divided into equation 9 and into an
19 equation 12. I can't follow the breakdown.

20 MR. IOTTI: Let me make a note. Actually,
21 I was looking... For reason I knew that this was going
22 to be your next question.

23 MR. FLECK: We're on the same wave length.

24 MR. IOTTI: I actually had a worked out
25 example and I appear to... I've got to look through

1 all my files now.

2 MR. FLECK: Okay, look.

3 MR. IOTTI: But I want to make a note...

4 MR. FLECK: As long as we can get something
5 there.

6 MR. IOTTI: Give example on how... So what
7 we'll do, we'll pick one of them, okay. I think that's
8 the one that I have.

9 MR. FLECK: Fine. If I can follow one of
10 them...

11 MR. IOTTI: And we'll... You have to go
12 back to the tables, you know, for the maximum intensity.

13 MR. FLECK: Yes. I went to the tables...

14 MR. IOTTI: We'll tell you which table to get,
15 how to combine them, okay, and how you derive all the
16 language.

17 MR. FLECK: I did that and I got lost and
18 then I figured...

19 MR. IOTTI: Well, I did the same thing many
20 times.

21 MR. FLECK: Part of the tables may have left
22 out some of the information that I needed, so if you
23 could have an example...

24 MR. IOTTI: No, all the information is here,
25 but it's in about four places.

1 MR. FLECK: Okay.

2 MR. IOTTI: Okay, so you've got to go everywhere.
3 Give an example on how to derive value of total stress
4 intensity and also how that is broken down into
5 equation 9 and equation 12.

6 MR. FLECK: Yes. And that would give me a
7 better feeling for your 3-SM for equation 9.

8 MR. IOTTI: Okay.

9 MR. FLECK: That, I believe, is what your
10 allowables are based on there and if I can get something
11 I can follow, I can either agree or disagree on a more
12 reasonable basis.

13 MR. IOTTI: That's it, but I think I need to
14 polish it up.

15 MR. FLECK: Okay, fine. I'd like something
16 that I...

17 MR. IOTTI: This was one of the examples I
18 was...

19 MR. FLECK: Yeah.

20 MR. IOTTI: ...referring to.

21 MR. FLECK: Well, if I can follow what you're
22 doing, I think I'll understand your criteria a little
23 better and have a feel for whether I think we're in the
24 same ballpark or whether additional questions would
25 generate from that.

1 MR. IOTTI: Maybe... Let me just, for
2 instance, pick this one. I'm trying to recall now this
3 one which was... This is the... had a marginal pressure
4 stress of 4.8 in equation 9 (inaudible) 12.45.

5 You've got to look at the inside surface
6 and at the outside surface and you've got to go to
7 the table that give you these two piece of information.

8 CHAIRMAN BURWELL: Can you speak up a little
9 bit?

10 MR. IOTTI: Can we go off the record because
11 I'm going to provide this on the record, okay? I'm
12 just...

13 MR. FLECK: Giving me a little preliminary
14 reference.

15 MR. IOTTI: I want to make sure that what
16 I'm going to send him, it's acceptable to him so I'd
17 like to just have a short discussion off the record to
18 tell him what it is that I'm going to send him and see
19 if he needs more.

20 CHAIRMAN BURWELL: Okay, let's go off.

21 (Off the record.)

22 CHAIRMAN BURWELL: While we were off the
23 record Dr. Iotti showed Mr. Fleck a hand calculation.
24 They discussed the analysis performed on the hand
25 calculation.

1 With Dr. Iotti's explanation of the hand
2 calculation, which he will provide on the record, why,
3 then that appeared to satisfy Mr. Fleck, subject to
4 its review, of course.

5 MR. FLECK: Right.

6 CHAIRMAN BURWELL: Now, with that, I'll turn
7 the meeting back. Mr. Fleck, I believe you were dis-
8 cussing...

9 MR. FLECK: Right. The next question I have
10 would be on page 62, which refers to the evaluation of
11 the transient stress and the damage factors as shown.
12 Here again, I would like some clarification in terms
13 of what cycles were used.

14 In other words, how the numbers were derived
15 and back-up input for that. You could come up with a
16 useage factor of .04 and .06, respectively, and I'd
17 like to see what your assumptions were as far as the
18 cycles assumed and what have you.

19 MR. IOTTI: We have all of that. I was
20 wondering whether we actually put it in the affadavit.

21 MR. FLECK: I don't believe it was there, but
22 again, you may find that it is and I have overlooked it.

23 MR. IOTTI: Yeah, for instance, it tells you
24 on page 69 through 71 is a little bit more explanation
25 as to how the fatigue analysis was considered and it

1 tells you what kind of cycles we looked at.

2 MR. FLECK: Sixty-nine?

3 MR. IOTTI: Sixty-nine through seventy-one.

4 CHAIRMAN BURWELL: Sixty-nine through seventy-
5 one of the affidavit.

6 MR. IOTTI: Of the affidavit.

7 MR. FLECK: Oh, of the affidavit.

8 CHAIRMAN BURWELL: Ah, well, how are we going
9 to label...

10 MR. IOTTI: It included all of the design
11 transients for the plant's, you know, specification,
12 plus the maximum plant induced stresses, the... And
13 then it computed how many cycles one could, in fact,
14 tolerate.

15 For instance, for the maximum alternating
16 stresses we were computing we decided that we would
17 have about 22,000 allowable number of cycles. For the
18 number of heat-up and cool-down cycles we used 200,
19 and for the seismic 200 cycles were also considered,
20 20 significant cycles per earthquake.

21 MR. FLECK: I guess the only thing, it
22 resolved that crete could be a problem. You would
23 have to do a crete damage accumulation on that, too.
24 But it looks like you'd have plenty.

25 MR. IOTTI: Well, our conclusion was that

1 we didn't have crete so we didn't consider it. That's
2 something that's still open, as far as you're concerned.

3 MR. FLECK: Right. All right. Then another
4 general question I have...

5 MR. IOTTI: Now, do you have sufficient infor-
6 mation or do you need more on the fatigue?

7 MR. FLECK: That should give me enough to go
8 back to see whether the cycles are reasonable and
9 everything else.

10 MR. IOTTI: If you need more... Mr. Burwell,
11 how do we handle... If he needs additional information,
12 does he come through you or could he call me directly?
13 It may be more expedient because I know the difficulty
14 he must have reading through this because I wrote it
15 and I know the difficulty I had it, I had with it.

16 So I can see where one reading it would have
17 difficulty, and on occasion a quick phone call that
18 says, "Look, I'm not understanding. What am I reading
19 here? Can you refer me to a page?" can save him a lot
20 of time.

21 CHAIRMAN BURWELL: I quite agree, and if I
22 can get Mr. Fleck to write me a hand-written note
23 explaining that you called and what the subject was
24 and any major conclusions. Just a brief summary.

25 MR. FLECK: We normally have a telephone

1 format that we use when we...

2 CHAIRMAN BURWELL: That'll be fine.

3 MR. FLECK: ... and I could transmit that to
4 both you and to Bob so the misunderstandings could be
5 limited.

6 CHAIRMAN BURWELL: Serve as to confirm the
7 conversation.

8 MR. IOTTI: Whatever I send him, of course,
9 I'll send a copy to you and to everybody. I'm just
10 trying to save time.

11 MR. FLECK: Okay, then I have another very
12 general question on page 72, 78 and 84.

13 MR. IOTTI: This is still that attachment?

14 MR. FLECK: Right.

15 MR. IOTTI: Seventy-two, oh, these are all
16 the tables.

17 MR. FLECK: Yeah. The wording now comes in,
18 partial pre-load, and I just had no idea or feel what
19 is partial pre-load. What does it mean? What's your
20 definition of it? Why is it included is what I really
21 have from reading the information, having decided what
22 the significance of it is.

23 MR. IOTTI: Oh. The pre-load as defined in
24 our test was the maximum pre-load that we could expect
25 to ever see in the field, okay?

FREE STATE REPORTING INC.

Court Reporting • Depositions
D.C. Area 261-1902 • Balt. & Annap. 269-6236

1 MR. FLECK: Okay.

2 MR. IOTTI: And so we specify for Westinghouse
3 that where they ran the test and when they did the final
4 (inaudible) they should use this upper bound value
5 pre-load. That's called the pre-load.

6 The partial pre-load is a lower value which
7 is generally typical of the minimum, or a little bit
8 higher than the minimum value that we, that we choose
9 to flow.

10 We did this to try and find the sensitivity
11 of the results of the pre-load.

12 MR. FLECK: I thought that might be the case,
13 but I didn't see a definition and I think that's what
14 I needed. You might want to include it.

15 MR. IOTTI: I'll clarify it. Partial pre-load,
16 clarify what we mean.

17 MR. FLECK: Okay. Okay, this has been
18 answered already. Okay, now we get to the test report,
19 and on page 54 all of a sudden I see the test was con-
20 ducted with 600 foot pounds of caulk and the specified
21 caulk that 2C had was 240 foot pounds.

22 MR. IOTTI: The explanation is simple for the
23 difference. A 240 foot pound we could do anything.
24 Not only that, we couldn't get that U-bolt to even
25 come close to the pipe. We had gaps all over.

1 MR. FLECK: Okay. This leads to a question.

52

2 That's what I thought the problem was. Then I wondered
3 in the field is 240 foot pounds adequate. If the test
4 showed that you need 600 foot pounds to even accomplish
5 the kick, so to speak, why is 240 adequate?

6 MR. IOTTI: Well, one of the reasons we
7 need that to accomplish the fit is that the U-bolt came
8 to the testing facility incorrectly sized. We had to
9 spread it out at the testing facility, and that hasn't
10 happened in the field, to the best of my knowledge.

11 MR. FINNERAN: No.

12 MR. FLECK: I thought that was the case,
13 but I'd like to get that firm in my mind that the
14 article you tested wasn't typical and you had to do
15 something to bring it into its sub-crushing and load.

16 MR. IOTTI: That's correct. That's correct.
17 The other thing is that the 250 foot pound, which is
18 the minimum value that we plan to have for that size
19 pipe in the field, is arrive at from the final element
20 analysis.

21 MR. FLECK: And that would provide your
22 friction resistance you needed.

23 MR. IOTTI: With sufficient friction, right.

24 MR. FLECK: Okay. And I guess on page 52 and
25 53 I had a question that I think we've answered already.

1 What is the apparent strain, and that is really tempera-
2 ture compensating.

3 MR. IOTTI: We have all of the raw data. We
4 can give you the raw data plus the explanation. I mean
5 these are reams and reams.

6 MR. FLECK: Well, normally, when I've been
7 involved in strain gauge testing, we either specified
8 we want the bridge wide for temperature compensating...

9 MR. IOTTI: These are temperature compensated.

10 MR. FLECK: And apparent has been a new term
11 that I wanted to make sure that my definition and your
12 definition were the same. Okay, then there's a typo
13 error on page 60, I believe.

14 The strain gauge leg S-5 on gauge 1, or
15 leg 1, rather, and S-10 do not agree with the sketch
16 on Sketch 5 on the preceding page, 58. The S-5 appears
17 to be on leg 2.

18 MR. IOTTI: Be careful, those are thermal
19 couples. Those are not strain gauges.

20 MR. FLECK: The temperatures?

21 MR. IOTTI: Yeah. Those are temperatures
22 measurement. For the strain gauges you have to go to
23 the higher one.

24 MR. FLECK: Okay. Then I'm curious why are
25 thermal couples on... and you're plotting pre-load

1 versus cycles. Wouldn't you want to have strain gauges?

2 MR. IOTTI: Yeah. Well, we do have strain
3 gauges also.

4 UNIDENTIFIED SPEAKER: Hank's on page 58.
5 I think you're on page 59.

6 MR. IOTTI: Oh, okay. Well, he said the
7 preceding page so...

8 MR. FLECK: Oh, okay, I'm sorry.

9 MR. IOTTI: ...I went to page 59.

10 MR. FLECK: Page 58 is the Sketch 5...

11 MR. IOTTI: Oh, okay.

12 MR. FLECK: ...and page 60 is where the
13 Leg 1 shows a S-5. And it doesn't appear to be... S-5
14 is on Leg 1 and it shows an S-10 that doesn't appear to
15 be on Leg 2.

16 MR. IOTTI: I'll have to go back and recon-
17 firm that. It may be a typo, but I don't know enough
18 to be sure.

19 MR. FLECK: I think it may be, yeah.

20 MR. IOTTI: I don't want to give you infor-
21 mation that may turn out to be wrong.

22 MR. FLECK: Okay. And page 66, I believe
23 there's another typo, middle of the page, Leg 2
24 gauge...

25 MR. IOTTI: Just a minute, Hank. If I don't

1 write it down, I'll forget it. Okay.

2 MR. FLECK: On page 66, in the middle of the
3 page, Leg 2, paren, gauges S-4, S-11, end paren, equal
4 5316 pounds. I believe that should be...

5 MR. IOTTI: That's 3516.

6 MR. FLECK: I believe it should be 3516.

7 And on page 65 and 68 we come back to the creep, and
8 that was mentioned before. The other thing I noticed
9 there on page 66 you have a different ambient tempera-
10 ture for your initial reading and the last ambient was
11 14.4 degrees higher where you have a TATB effect because
12 the pipe is stainless and the clamp is carbon steel.

13 So you would really have a greater difference
14 in the loss of pre-load than is what's shown here. So
15 it would tend to hurt you more as far as for the creep
16 caution.

17 MR. IOTTI: Would you mind going over that
18 again because...

19 MR. FLECK: Okay. Due to the fact you have two
20 different materials, when you start at ambient and don't
21 end at the same ambient, you have, in effect, raised
22 the pre-load.

23 If they were both the same materials and you
24 went from a high, a low ambient to a high, it would have
25 no significance. But the carbon steel does not expand

1 at the same rate as the stainless. Therefore, the
2 stainless pipe is growing, which is the same thing as
3 shortening the raise which adds to pre-load.

4 MR. IOTTI: That's correct.

5 MR. FLECK: Therefore, the values that you have
6 here would even show a greater loss than what you had
7 when you're quoting the 1%.

8 MR. IOTTI: Yeah, you pre-loaded it slightly
9 because you say your final ambient is slightly higher.

10 MR. FLECK: And in general, that could be
11 anywhere from 50 to another 100 pounds out of the...

12 MR. IOTTI: Well, I can do the calculation
13 quickly enough.

14 MR. FLECK: Right. But what it does, it adds
15 to the fact that you're losing more load after 24 hours,
16 and this is the creep test. Originally I thought when
17 I looked at it that possibly you would have better
18 agreement.

19 But, no, you even have worse agreement than a
20 1% loss. It's slightly greater.

21 MR. IOTTI: That's possible. I'll have to
22 go back to the raw data. This is going to be all part
23 of the answer.

24 MR. FLECK: The creep, right.

25 MR. IOTTI: We're talking about a total of

1 what? Five degree difference in ambient temperature.

2 MR. FLECK: Fourteen point four degree
3 difference. The ambient originally was 77 and the
4 final was...

5 MR. IOTTI: Ninety-one point something.

6 MR. FLECK: Ninety-one point four is your
7 final ambient and your original ambient is 77 degrees.
8 On page 55.

9 MR. IOTTI: Yeah, got it.

10 MR. FLECK: So again, the creep should be, I
11 think, elaborated as far as whether it does or does not
12 exist. From the test data it appears it does exist in
13 a magnitude such that you want to have in-service
14 inspection, and until that's verified that could be
15 the open item.

16 MR. IOTTI: Well, yeah, we'll try and provide
17 you as much answers as we can. We certainly don't want
18 to do in-service inspection.

19 MR. FLECK: I understand your concern there,
20 but...

21 MR. IOTTI: Well, it's not just our concern.
22 The problem is that there's many other plants which
23 are in the same boat.

24 MR. FLECK: Yeah. And if we can establish
25 better creep data, I think we can come to a very logical

1 engineering conclusion.

58

2 MR. IOTTI: Well, what I may also do if I have
3 a little bit more time is to try and get additional creep
4 data on A-36 if anything else like that exists, you
5 know.

6 MR. FLECK: You may have to establish it.

7 MR. IOTTI: That's been the problem with this
8 material.

9 MR. FLECK: Right. But our concern would be
10 that we have closed that loop and that if there's any
11 doubt, in-service inspection would be the only answer
12 to it, which would mean in time you'd prove that either
13 we're right or you're right by checking the torque on
14 the bolts.

15 MR. IOTTI: That may be a one-time in-service
16 inspection.

17 MR. FLECK: That's very true.

18 MR. IOTTI: If the first one you pass, then
19 obviously there's no creep.

20 MR. FLECK: That might be your logical out.
21 The only thing would be what time interval we set for
22 it, whether it's six months, a year.

23 MR. IOTTI: We still have to establish that
24 from the data.

25 MR. FLECK: Right.

1 MR. IOTTI: So I have to go back to the data.

2 MR. FLECK: Right.

3 MR. IOTTI: And the data scatter because what
4 you here see is a curve.

5 MR. FLECK: Right.

6 MR. IOTTI: Really, you need to go back to the
7 data scatter.

8 MR. FLECK: Then my last question, on page 88,
9 is a very general question. The natural frequency of
10 the test...

11 MR. IOTTI: Wait a minute, Hank. Let us get
12 that down. No, I've got it on pre-loads.

13 MR. FLECK: Yeah, I'm rushing. Slow me down.

14 MR. IOTTI: Well, I know we're all anxious
15 to get this over and done with. Page 77?

16 MR. FLECK: Eighty-eight. Just from a general
17 curiosity, from an engineering standpoint, I wonder
18 where the 75 hurts basically would be found. Would it
19 be found in the pipe, the specimen, the test rod or
20 whatever.

21 What I would like to do is kind of get a
22 feel for what was really getting the most damage from
23 the test, whether or not I should even be concerned
24 with it is immaterial.

25 MR. IOTTI: What was getting the most damage

1 from the test was the test apparatus. Neither the pipe
2 nor the...

3 MR. FLECK: Because I went through some rough
4 calcs. For that span you'd be way over this frequency,
5 and for the cross member you're way over the frequency
6 and...

7 MR. IOTTI: Well...

8 MR. FLECK: I guess what I'm getting at...

9 MR. IOTTI: What did you assume is your
10 boundary condition, though, because, see, that's a
11 problem.

12 MR. FLECK: Yeah, fine.

13 MR. IOTTI: The reason that we... By hand
14 calculation you're operating 100 hurts, okay. You have
15 a natural frequency of that span, but by the time you
16 put the boundary condition, which aren't really
17 fixed, you're now back to something of the order...
18 Seventy-five hurts was determined by actually scanning
19 through it, finding the maximum (inaudible).

20 MR. FLECK: I agree, and that's a good way.
21 But then to be meaningful for me, whether I put a lot
22 of emphasis on this data, is to find out what was the
23 weak link, and if it wasn't the U-bolt, then I don't
24 care.

25 MR. IOTTI: The weak link was not the U-bolt

1 and this is because we couldn't drive.

2 MR. FLECK: I really don't care about the
3 data. I realize this.

4 MR. IOTTI: At this frequency we just couldn't
5 drive the force through it.

6 MR. FLECK: Right. So I would have looked
7 at it as, again for my own engineering idiosyncrasy,
8 as well, the frequency was 75, but it wasn't in the
9 area of the test specimen.

10 Therefore, I really concluded what you con-
11 cluded before. You didn't have enough force to get
12 any meaningful data from it.

13 MR. IOTTI: So really all of our conclusion
14 is essentially predicated on the 9 hurts test.

15 MR. FLECK: Right. So I kind of looked at
16 that portion of the test and I wiped it out of my mind
17 as being meaningful or not.

18 MR. IOTTI: Did he bring the tape?

19 UNIDENTIFIED SPEAKER: I do not have the
20 tape with me.

21 MR. IOTTI: We took a movie of the test, of
22 this particular test, that actually shows the...

23 MR. FLECK: What frequencies have you finished?

24 MR. IOTTI: Well, we took it at both. You
25 really don't see a thing.

1 MR. FLECK: Yeah, you probably wouldn't.

2 MR. IOTTI: But the 9 hurts, you see things.

3 MR. FLECK: You used a strobe then when you
4 took the movies so you could...

5 MR. IOTTI: It's a very slow speed. Very
6 slow speed. It shows it. It's very vivid.

7 CHAIRMAN BURNELL: I can have the tapes in
8 here overnight if you want to see it.

9 MR. FLECK: It's just my own engineering
10 curiosity, like anything...

11 MR. IOTTI: We have a TV that we could show
12 it on? It's one of these video cassettes.

13 UNIDENTIFIED SPEAKER: A VHS, isn't it?

14 MR. FLECK: It would be nice for me to get
15 more of a feel for it

16 MR. IOTTI: Yeah, it's a VHS.

17 UNIDENTIFIED SPEAKER: Be here tomorrow?

18 MR. FLECK: Yeah, I'll be here tomorrow.
19 Again, when I made some quick calcs I just said, well,
20 it's not in the area that I'm concerned, or if it is
21 I better find out...

22 MR. IOTTI: No, we can have it sent over.

23 CHAIRMAN BURNELL: We could get access to
24 one if you all need it.

25 MR. IOTTI: Because I'll tell you, it certainly

1 drives home a point. Nothing like seeing it.

2 MR. FLECK: Yeah. If it's available, I think
3 I'd appreciate seeing it. Whether we had the time for
4 it would be another thing. But my own curiosity just
5 said, "Gee, it can't be the pipe. It can't be the
6 cross piece. What was the thing you were driving?"

7 I understand what you're saying and if we
8 say, well, the test really didn't... You didn't have
9 enough energy to drive what you wanted to drive. And
10 if you did, it also concludes that the frequencies are
11 so high an earthquake would never drive it.

12 MR. IOTTI: They can't... They can't drive it.

13 MR. FLECK: Yeah. That kind of summarizes
14 the areas that I had specific questions. I have one
15 general question, though. I noticed you do have pipes
16 under four inches, and I don't know what you plan to do
17 or whether the finite element for the two-inch or the
18 one-and-a-half-inch pipe sizes you have, but I do have
19 a concern knowing that these pipe sizes and the standard
20 gauges or schedules you'd have on it would be such that
21 they would be much stiffer than the four-inch, much
22 being at least a factor of one and a half over it.

23 And I'm wondering what would be done to
24 alleviate any thoughts that now the pipe is greatly
25 stiffer than the clamp, are we getting enough pre-load

1 in the clamp or is it dissipating itself.

2 MR. IOTTI: Well, the...

3 MR. FLECK: Do you have any plans to do any?

4 MR. IOTTI: We have two plans. One of our
5 original plans was to use the same pre-load there as
6 for the four-inch, but we probably will abandon that
7 plan.

8 But we do have the finite element model and
9 we would use the finite element model to guide us in
10 establishing what kind of a pre-load we need to establish
11 for the smaller lines.

12 MR. FLECK: Okay. I would definitely like to
13 see the last of your plans activated so you pin down
14 the fact that now you're, you're getting in a realm
15 where that small pipe is probably going to be appreciably
16 stiffer than the clamp cross piece member, and the
17 finite element model, I think, verifies.

18 Your test is reasonably close for the U-bolt
19 at least and for your friction, and I would accept
20 the additional finite element...

21 MR. IOTTI: Our biggest concern and the
22 reason why we would run the finite element is really
23 more from the standpoint of the pipe than we do for the
24 U-bolt and the... There are simplified methods that we
25 can utilize and we've kind of benchmarked against the

1 finite element. It can tell you what the U-bolt will
2 do and what the backing plate will do, but it's not so
3 simple to determine what the pre-load will do to your
4 pipe and that's why we would rather use the finite
5 element in that regard.

6 CHAIRMAN BURWELL: Would you move the mike a
7 little closer to you, please?

8 MR. IOTTI: Either that or I move closer to
9 the mike, one of the two. So that's, that's our
10 current plan. We haven't quite determined which one
11 of the two will follow, but we're leaning toward the
12 latter, because the reason we developed all of the finite
13 element models to be able to interpolate and extrapolate
14 from the test data.

15 MR. FLECK: Okay. Well, I would probably
16 feel that that should be included, just so we see that
17 the values that you're going to talk it to will still
18 satisfy your Table P and also provide rotational
19 resistance.

20 And I think you have the tools to do it with
21 so it's just a question of when you present it.

22 MR. IOTTI: Well, I'm not sure that we had
23 any intent to presenting the values at this point in
24 time, other than say here are the tools that we would
25 use to determine at what value we would torque all of

1 the various pipes in the plant. Now, obviously, there
2 will be a set of minimum values that will have to be
3 agreed upon before Tutco goes by and inspects this 380
4 U-bolts and torques them down or, you know, if they're
5 higher, they're not going to touch them.

6 But if they don't have that torque, they're
7 going to be torqued up to those minimum values.

8 MR. FLECK: Okay, but you would expand your
9 Table P to include all pipe sizes then? That's your
10 minimum torque.

11 MR. IOTTI: I'm not thoroughly sure that we
12 would do so in terms of a table. It may be a curve
13 as a function of all the pipe schedule and size, yeah.

14 MR. FLECK: But the person in the field would
15 have something to go by.

16 MR. IOTTI: Would have something. Oh, yeah.
17 He's not just going to walk without...

18 MR. FLECK: That's my only concern, how you
19 will present it.

20 MR. IOTTI: That will be made available.

21 MR. FLECK: Is the way you feel is easiest
22 for them to read.

23 MR. IOTTI: What I was trying to say is that
24 it's not our intent to augment to the affidavit or
25 supplement the affidavit. This would be an independent

1 type chart or figure developed to serve as guidance for
2 the people in the field when they were torqued.

3 MR. FLECK: All right, as long as the affidavit,
4 which states that Table P would be expanded...

5 MR. IOTTI: We would prefer not doing that
6 because we don't see what purpose that would serve.
7 We've already stated we're committing to arriving at
8 minimum pre-load value so I think the Commission to
9 certainly audit us...

10 MR. FLECK: Right.

11 MR. IOTTI: ...in terms that says "do you
12 have such a figure? Do you have such a table?" They
13 can come in and verify that for each pipe size there
14 will be a guidance given to the, to the people. What
15 do you call it? The inspector or torquer or...

16 CHAIRMAN BURWELL: Both.

17 MR. IOTTI: Both. Now, we have a torquer and
18 an inspector.

19 MR. FLECK: Then I have no further comments
20 to that. Dave may have some additional comments he
21 might want to include, but those were the areas where
22 I felt either I needed some information or things were...

23 MR. IOTTI: Before we leave this topic, or
24 at least before we leave your particular comment, could
25 I summarize? I have 11 items that I think I owe you.

63
1 MR. FLECK: Okay.

2 MR. IOTTI: Okay. And the first one is that
3 you would like to have additional raw data, in particular
4 the spread of the data and the specific heats of the
5 U-bolts that were used in the tests so that we know what
6 their yield strength were and so forth to confirm the
7 validity of this relaxation down to something of the
8 order of one half of the yield strength. Okay.

9 The second one is to, which is fairly per-
10 vasive, is to provide more information on the creep
11 test of the 4-inch pipe. Okay?

12 MR. FLECK: Right.

13 MR. IOTTI: And also corollary to that is to
14 check on the materials of the nuts. Okay? The third
15 one is to... Well, I think that one is resolved. This
16 was that typo on page 59 that should be 29.13, so I
17 think you can write down 29.13.

18 Then we are supposed to check on the accuracy
19 of that drawing that shows the thickness of the back-up
20 plate for the 4-inch pipe to be a quarter inch instead
21 of a three-quarter that was used.

22 We'll provide you some rewording on page 42
23 of that Attachment 3, that's that Westinghouse report,
24 to explain really what we mean when we say the stresses
25 on the 32-inch mainstream are negligible and why it's

1 really not that important. The test didn't show whether
2 it was accurate or not. The finite element confirmed that.

3 The next one is what would happen if we were to
4 use the C indices instead of the B indices for the elbows
5 as part of the whole calculation with regard to the first
6 approach that we took where we used the 3S for both
7 equation 9 and equation 12.

8 The next thing is I'm to give you an example
9 on how to derive the values of the total stress inten-
10 sities from the various results of the finite element
11 analyses and how to break the total stresses down into
12 an equation 9 and equation 12 stress intensity.

13 Clarify what we mean by partial pre-load,
14 although I think I gave you the answer. I might as
15 well provide that in writing. There's a discrepancy
16 between Figure 21 on page 60 and... that shows the
17 location of the strain gauge 5 and 10 on perhaps the
18 opposite leg, so where they actually are that we have
19 to clarify.

20 There's a typo on page 66 in the test report
21 which I'll correct, but you already know that it's
22 juxtaposition of the first two figures. And finally,
23 the effect of having a different ambient temperature at
24 the beginning and at the end of the creep test and what
25 effect that would have on loss of pre-load.

1 That's, of course, tied in with the whole
2 question on creep. That's the only thing I have.

3 MR. FLECK: That agrees with what I have, too.

4 CHAIRMAN BURWELL: Okay, any further questions
5 on U-bolts?

6 MR. TERAQ: Well, I didn't have any questions
7 on this particular submittal on U-bolts, but I wonder
8 if we could go back to our previous submittal on the
9 U-bolts acting as two-way where there was test data.

10 I just want one thing clarified that apparently
11 ties in, as long as we're on U-bolts. On Attachment 1...

12 MR. IOTTI: Give me one second, Dave. Let me
13 get my file on U-bolts acting as two-way restraints.
14 Okay. Attachment 1?

15 MR. TERAQ: Attachment 1.

16 MR. IOTTI: Okay.

17 MR. TERAQ: Back in Figure A-13.

18 MR. IOTTI: A?

19 MR. TERAQ: Right, A-13.

20 MR. IOTTI: Those are not valid anyhow.
21 That's just one that they're supposed to give us an
22 ambient fact figure. Thirteen or thirty?

23 MR. TERAQ: A-13.

24 MR. IOTTI: Thirteen.

25 MR. TERAQ: It's the normal load versus

1 elongation.

2 MR. IOTTI: Yes.

3 MR. TERAQ: Okay, there on I guess Figure A-13,
4 A-14 and A-15 and also Figures A-28, A-29 and A-30...

5 MR. IOTTI: Well, 28, 29, 30, I'm going to
6 have to replace for you because something had mal-
7 functioned when these figures were plotted, and we've
8 been expecting the correct figures from ITT Grenile.

9 MR. TERAQ: Okay.

10 MR. IOTTI: A-13, 14 and 15 are correct, to
11 the best of our knowledge.

12 MR. TERAQ: Okay. I guess these are the
13 flocks. They're on a different scale and the horizontal
14 scale, it's not clear exactly what (inaudible) are.

15 MR. IOTTI: There is no horizontal scale.
16 Now, the first ones, 13, 14 and 15 I believe are on...
17 You can see it's .5, 1.5... I mean 1 and 1.5. If you
18 look at Figure A-13?

19 MR. TERAQ: Yes.

20 MR. IOTTI: Very, very...

21 MR. TERAQ: Yes, I see that.

22 MR. IOTTI: You've got to really, you've got
23 to really look, okay?

24 MR. TERAQ: It's handwritten in there. It's
25 only on the first sheet.

1 MR. IOTTI: Right. The other ones, I believe,
2 are still the same scale, but we'll confirm that for you.
3 But the ones that are definitely off and they don't make
4 any sense is the 29, 30 and 31. So (inaudible).

5 MR. TERAQ: Would the scale have changed on
6 the 28, 29 and 30?

7 MR. IOTTI: No way of knowing what the scale
8 even was. The thing malfunctioned and we're supposed to
9 get the correct figures.

10 MR. TERAQ: Okay, that's all I wanted to know
11 there.

12 CHAIRMAN BURWELL: Let's see, you're going
13 to replace Figures what? 28?

14 MR. IOTTI: Twenty-nine and thirty.

15 CHAIRMAN BURWELL: Will replace A-28, A-29
16 and A-30.

17 MR. FINNERAN: We'll replace if we can... It
18 may be that the data is not reliable at all and that
19 there isn't anything to replace it with.

20 CHAIRMAN BURWELL: Okay, fine. But you will
21 either confirm that we should use that or we shouldn't?

22 MR. IOTTI: Can we go off the record for a
23 second?

24 CHAIRMAN BURWELL: Off the record.
25 (Off the record.)

1 CHAIRMAN BURWELL: Okay, so you will provide
2 us something on those three figures.

3 MR. IOTTI: Those three figures, yes.

4 CHAIRMAN BURWELL: And furthermore, you will
5 confirm the scale, the absistance (ph) scale...

6 MR. IOTTI: For 13, 14 and 15.

7 CHAIRMAN BURWELL: ... on Figures A-13, A-14
8 and A-15. Okay. Thank you. That particular discussion
9 was held on a motion for summary disposition regarding
10 U-bolts acting as two-way restraints. I just wanted
11 to get that into the record to make sure... make sure
12 which motion we were discussing.

13 With that, the next item I had was the motion
14 on forced distributions and axial restraints. That word
15 is axial, a-x-i-a-l. Axial restraints. Okay, the
16 document we are discussing was filed on July the 9th,
17 1984, and this concerns the applicant's motion for
18 summary disposition regarding allegations concerning
19 consideration of forced distribution in axial restraints.

20 MR. FLECK: Okay, this is Hank Fleck again.
21 I think I might have some questions there. One of
22 them basically deals on page 7 of the affidavit, and
23 it's a question that's generic, I guess.

24 In this case the paragraph that's referenced
25 in this 1974 code, NF Article 3231.1 defines... and

7.1
1 it defines the subject matter in not too explicit terms.
2 It deals with primary and secondary stresses, and in this
3 case it's been, I guess, adopted that this paragraph
4 indicates that for the axial struts and/or snubbers
5 receiving additional load from cornginal (ph) restraint
6 from the pipe would be treated as a secondary.

7 I take issue with that and I look at the 1980
8 code for clarification of what is meant for primary and
9 secondary, realizing the '74 code has a lot of ambiguous
10 areas.

11 And I submit the table from the 1980 code,
12 and it's NF 3623.2-1. It's the elastic analysis
13 categories and stress limit factors for Class 1, 2, 3
14 and MC linear type supports designed by analyses/piping
15 supports.

16 Primary stresses has a Note 5. That Note 5
17 indicates for service levels A, B, C and D stresses
18 induced by restraint of free-end displacement and
19 anchor motions of pipes shall be considered as primary.

20 So my issue here is the secondary stresses
21 generated here would, by my definition and the 1980
22 code definition, be primary stresses. And I guess this
23 would be an area of dispute or contention.

24 MR. IOTTI: Hank, could you give me that table
25 number again? Okay, so service level B allowable is

1 being increased over what it used to be.

2 MR. FLECK: Right. So the treating of or
3 interpretation of the '74 code is not in existence anymore
4 in the '80 code. And I realize that interpretation has
5 been going back and forth on what is primary and what is
6 secondary.

7 Instead of wasting our time here to dispute how
8 the code was worded in '74, I just looked to the '80 code
9 as clarification of that. I know you are bound to the
10 '74 code, but as an engineer, I look at what I would
11 consider would be reasonable and the '80 code has clarified
12 in my mind how that type load should be treated.

13 And I submit then if I look at a snubber that
14 could be in this position, or two snubbers, if I use
15 three times the A level, I'd be way over the failure
16 load of the snubber because the fault load established
17 by test is 10% of the test value.

18 So I really have a concern here that it should
19 be treated primary, and I realized in your summary,
20 your analysis, you used a conservative approach to
21 determine the resistance of the dual supports, but I have
22 no feel for whether you, if you used a realistic
23 analysis, whether that would reduce such that you wouldn't
24 exceed loading and snubbers.

25 And that... I come back to the '84 code as

1 far as for... or the '80 code as far as for the
2 clarification of that interpretation.

3 MR. IOTTI: Well, here is, of course, a
4 reasonably gray area that's to be discussed because
5 implicit in this statement is that there is a concurrence
6 that the rotational constraint of this particular
7 (inaudible) needs to be modeled in the most conservative
8 fashion.

9 That in itself can probably precipitate a
10 discussion that can go on for a long, long time.
11 Applicant's position is that the modeling of the restraints
12 as a single axial restraint is being, in general, an
13 industry practice and it's appropriate.

14 MR. FLECK: Well, industry practice is changing,
15 though. I believe the plants in Arizona have modeled it
16 differently now.

17 MR. IOTTI: Well, that's fine, but like
18 everything else, you have to go back to when this was
19 done, at the time when the design was undertaken. Now,
20 we're not disputing the fact that we ought to review
21 the present design of the plan versus what might be,
22 you know, a good engineering view as to whether the
23 support is capable of accepting a load or it is not
24 capable of accepting a load.

25 And we have attempted to do that. But in doing

1 so we felt we could permit ourself a little bit more
2 latitude, number one. We are developing the additional
3 loads in a conservative fashion.

4 MR. FLECK: Not in all cases. In a lot you
5 are, yes.

6 MR. IOTTI: In all case.

7 MR. FLECK: You mean you're not using the
8 computer program?

9 MR. IOTTI: Even if it is in the computer
10 program, you're modeling it in a conservative fashion.

11 MR. FLECK: Maybe if you elaborate, I can...

12 MR. IOTTI: Well, you're doing a response
13 spectrum analysis in any case. You're not doing a
14 time history. If you were to do a time history and if
15 the piping is flexible enough, you'd find virtually no
16 correlation between the axial load and the torsional
17 load.

18 If your piping is rigid, however, you do.
19 Okay? So that, first of all, tells you that unless you
20 have a system that's rigid enough where you get coupling
21 of the axial and the out of plane bending due to the
22 stiffness effects of the system itself, where inertia
23 is not a consideration, you're likely to find that when
24 the maximum load occurs axially, your torsional load may
25 be very little at that time.

1 MR. FLECK: It may, but it may not.

2 MR. IOTTI: I have just defined for you...
3 We have actually ran time histories.

4 MR. FLECK: Okay.

5 MR. IOTTI: We have done a most simplified
6 system and that's why I can make the statement that I
7 cannot categorically tell you that they're not correlated.
8 What we did, we looked at the point and we imagined that
9 there was a restraint at that point.

10 So you input the earthquake at that point and
11 at other points of the simplified system, and depending
12 on whether the system is flexible enough so that at the
13 restraint what you get is inertial effect and you find
14 that correlation between the axial time history of the
15 response and the out of plane bending time histories of
16 the response are very, very, it's very, very low.

17 That would indicate that the peaks don't
18 occur simultaneously to the point where I could even
19 show you if you had a stiff enough system, the system
20 couples through the stiffness of the members that join
21 at that particular axial restraint, in which case the
22 correlation could be as high as one.

23 So when the peak axial occurs, you'll also
24 get the peak rotation. In that instance, yes, you would
25 have to then add the two. Okay? So...

1 MR. FLECK: Okay. Now, what I'm... Sorry,
2 go ahead.

3 MR. CHEN: This is Paul Chen. Can you hear
4 me up there? Coming back to this business of the
5 criteria for treating, you know, the loads as either
6 primary or secondary, I think in the previous hearing
7 Bruce said that the 1980 code, I think, clarifies the
8 position of the 1974 code.

9 MR. FINNERAN: We'll make some statements about
10 that and we'll let you... The code is not always
11 clarified. Sometimes they're taking conservative
12 approaches because of practices that they've identified,
13 and that's what I would like to address.

14 MR. TERAQ: Well, before we get into code
15 philosophy and explaining what the code is trying to say,
16 perhaps you could clarify some easier questions, and that
17 is when you say that you're going to take credit for
18 this three times the allowable increase, specifically,
19 what part of the support are you going to be taking
20 credit for?

21 Are you going to be taking credit for this in
22 snubbers?

23 MR. IOTTI: You are taking credit on each of
24 the two legs of the support, or the support itself.

25 MR. TERAQ: All right, now...

1 MR. IOTTI: Well, we can go through it support
2 by support as to where the weak link existed.

3 MR. TERAQ: Okay. I think what we'd like to do
4 is try to find out where you're going to take credit for
5 this because if you're saying that you're going to take
6 credit for the three times the allowable in the struts
7 and snubbers, we definitely take exception to that
8 because those are compliment standard supports and the
9 NF criteria for 3231.1 is for any supports that are designed
10 by linear elastic analysis.

11 MR. IOTTI: I understand.

12 MR. TERAQ: Okay. So we would not accept that
13 for any compliment standards so...

14 MR. FLECK: Or if we had an idea how many of
15 these exceed the primaries.

16 MR. IOTTI: There weren't that many, but...
17 And in some instances if we had used just level A or
18 the, you know, the 1974 edition of level B and C
19 allowables, we would exceed them.

20 If we agree that the proper way to model it
21 is by putting 100% of the load onto one leg of the
22 support.

23 MR. FLECK: Well, I guess the other thing,
24 not knowing how you modeled and it sounds like possibly
25 you used generic and not actual loops that were concerned

1 where they exceed loads. If you put in the proper
2 stiffness of the pipe, which is internally just due to
3 the pipe size, there are a lot of things we could do
4 to reduce the load.

5 MR. IOTTI: We could put local effects in pipes.
6 We could put local effects on the trunion. All of those
7 were not included. Okay?

8 MR. FLECK: I guess what I'm looking for is
9 one, I would like to have a definite feel of how many
10 and where and look at them in specific locations because
11 I would probably say I agree with the '80 code's
12 interpretation and not the '74.

13 MR. IOTTI: There's a total, there's a total
14 of 36 out of however many of these supports we gave you,
15 which is what? 198? Which would fail or would be
16 considered to have failed the criterion of the code of
17 1974, assuming that you just take '74 in the strictest
18 interpretation.

19 Everything is a primary strut, okay? So
20 that's however many. Now, the next question is how many
21 of these are snubbers? One, two, three, four, I'm
22 telling you that the snubber type, that doesn't mean the
23 snubber's the weak link.

24 Just telling you these approximately half,
25 I would say, are snubbers. One, two, three, four, five,

1 six, seven, eight, nine, ten, eleven, twelve, thirteen,
2 fourteen, fifteen, sixteen, seventeen, eighteen.

3 Exactly half.

4 I was looking at this as to whether, where we
5 had the remark that indicated where it failed. Well, we
6 can make that... we know where the weak links are. We
7 know that for some of these the weld turned out to be a
8 weak link.

9 I can't make the general statement... I don't
10 recall Peter saying that any of the standard support
11 itself, where they're in trouble.

12 MR. FLECK: So the axial then was, may not
13 be the area where you had to use three times?

14 MR. IOTTI: That may not be. We need to go
15 back and see if we have a complete list.

16 MR. FLECK: I think that would be helpful
17 before we argue and argue which interpretation is right.
18 If you know where you're critical, and if it's axial
19 members, then I feel strongly then.

20 MR. IOTTI: The crucial thing in our inter-
21 pretation is that we rely on the ductility of the support,
22 permit us to have that. That's what permit us to make
23 that interpretation.

24 MR. FLECK: But an axial member o ductility
25 could give you a compression stability problem or it

89
1 could give you a tension failure. You don't have the
2 leeway of plastic bending.

3 MR. IOTTI: I understand.

4 MR. FLECK: Okay.

5 MR. IOTTI: So far as... You're right. If
6 our problem is one of the supports which in fact does not
7 bend or plasticize or whatever, then the whole argument
8 is not valid because we're relying on that ability to
9 absorb unilastically some portion of this load.

10 MR. TERAQ: Well, one thing I do want to point
11 out, the reason why we brought up the snubbers and
12 compliment supports is because these type of trapeze
13 supports are, you might call them a hybridization of
14 compliment standards and structural steel.

15 Now, the component... I mean the structural
16 steel aspects, where you do use a linear elastic analysis,
17 I could understand your arguments to use three times the
18 increase in stress for those portions, but as far as the
19 compliment standard, there really is no basis for using
20 that. The increase for those compliment standard
21 (inaudible).

22 MR. IOTTI: I don't know how much time we want
23 to take up, but chances are we have all of the information
24 right here. Everyone of the support has gone through and
25 identified where the failure occurred.

1 MR. FLECK: I think it would be helpful, not
2 here maybe, but to provide that so we can either do battle
3 or agree.

4 MR. TERAQ: Yes, but it's... I'm saying that
5 even a good compliment standard is not very easy to say
6 where the failure occurred. Are you saying from tests
7 or from analyses?

8 MR. IOTTI: No, no. There we would consider...
9 Well, we're discussing failure. It's not failure here
10 that we're discussing, it's whether you exceeded the
11 recommended LCD values, okay, or, you know, per the
12 normal level or whether we take three times the LCD
13 value and so forth.

14 We're not talking about the component actually
15 failing, per se, okay, although I guess conceivably that
16 could be, could be the case. But...

17 CHAIRMAN BURWELL: This is Spot Burwell. I
18 wonder if we couldn't handle this more efficiently if
19 you people just tabulated that information.

20 MR. IOTTI: Well, the information is already
21 tabulated. What we need to do is in the remarks column
22 add explanation where, that are a little bit more lucid
23 than these cryptic notes that we have.

24 CHAIRMAN BURWELL: Have we the information you
25 have in your hand?

1 MR. IOTTI: Pardon?

2 UNIDENTIFIED SPEAKER: No.

3 CHAIRMAN BURWELL: Okay, we do not have the
4 table that you have in your hand?

5 MR. IOTTI: No, you do not. This is...

6 CHAIRMAN BURWELL: Okay, fine.

7 MR. FLECK: That would have to be edited to be
8 a little more presentable, I believe.

9 MR. IOTTI: And even this information that I
10 have in my hand, unless we're willing to take time off
11 and sit around the table and go through one-by-one...

12 MR. FLECK: No, I don't think...

13 MR. IOTTI: ...it's simpler for us to add on
14 the "remark" columns where, which particular portion of
15 the particular support could... A lot of these supports,
16 of course, passed.

17 MR. FLECK: Yeah, I think you see our concern.

18 MR. IOTTI: Well, the other thing that we now
19 want to... If you're going to quote us the '80, then,
20 then we consider ourself free to also take advantage of
21 the fact that, yes, the '80 code, it prescribed that you
22 not treat it as primary but it permitted an increase in
23 the allowable for level B and level C.

24 MR. FLECK: But you don't have a three times
25 allowable...

1 MR. IOTTI: No, I understand.

2 MR. TERAQ: Let's stay away from the '80 code.

3 MR. IOTTI: I understand.

4 MR. TERAQ: I don't think I want to get into
5 that, but we can get into an argument regarding primary
6 and secondary stresses from the sense that you are regard...

D.C. Area 261-1902 • Balt. & Annap. 269-6236

1 MR. TERAQ: You're going to take credit for
2 it as a secondary stress. Now, we could take exception
3 to that because what you're doing in that sense is, is,
4 yes, I would agree that the pipe rotation is self-limiting
5 but you could also argue that the pipe, even its
6 displacements are self-limiting.

7 So, so, it's the same...

8 MR. IOTTI: Well, it's the (inaudible). You,
9 you have to understand it is not only self-limiting but
10 it's very, very small.

11 MR. TERAQ: Well, okay, but that's the
12 arguments that are currently going through the Piping
13 Review Committee right now in the NRC is whether or
14 not...I'm sorry, not Piping Review Committee, the PVRC.

15 MR. IOTTI: The PVRC, yeah.

16 MR. TERAQ: Whether or not seismic stresses
17 and pipes should be considered primary or secondary.
18 So, from that standpoint, you're making the same type
19 of arguments with your rotations.

20 MR. IOTTI: That's correct.

21 MR. TERAQ: And from that standpoint we cannot
22 accept it at this time. We understand the arguments.
23 We understand why you're saying it's secondary, but at
24 this point, it really has not been either resolved either
25 in the industry or, specifically, not in the NRC to

1 accept that philosophy.

2 MR. IOTTI: Yeah, but you understand that
3 we're making that argument at the same time and it's a
4 complimentary argument to say, look, we don't really
5 agree we even ought to model it this way, but if you
6 force us to model it this way, okay, then, then it's
7 something that we also ought to consider.

8 We, we also have evaluated this by our normal
9 procedures, modeling a single axial restraint and evaluate
10 it against the allowable of the code, the '74 code.
11 In all instances, we're okay.

12 So, here, here, we're getting away from the
13 design practice that was being used at Comanche Peak,
14 and we're trying to defend an existing design. Will it,
15 in fact, fail or not? We're not designing a system
16 here. What, we're trying to prove to you whether the
17 system could, in fact, fail or not.

18 And I think that it's appropriate in that
19 instance to say, okay, suppose that you did have this
20 rotation? What would...if you have a sufficiently
21 ductile support there that can displace, you know,
22 strain sufficiently to absorb that, what that to me
23 means that the support isn't failing, you know,
24 provided I can cycle it through and not, you know, and
25 shake down to a lasting connection.

1 See, we're coming from that point of view. We're
2 not trying to say this is the method that we would use
3 to design the system, far from it. If we were to
4 start from scratch and, and, and design it with 100%,
5 you know, 100% split, we would design it per, per the
6 code. You'd have a little bit more massive support.
7 But we're trying to defend an existing design.

8 MR. TERAQ: All right. Well, let's go back
9 to a statement you made very early where you said this
10 was a standard engineering practice to model axial
11 restraints with two snubbers as a single restraint in
12 the piping model. I, I would agree to that.

13 In fact, as you pointed out in your affidavit,
14 CYGNA even stated this, too. But, first of all, I'd
15 like to point out that CYGNA configuration was not a
16 trapeze type. It was strictly a, a pipe with two
17 trunnions (Ph.) on it. It was not a trapeze type.

18 And second of all, standard industry practice
19 is to model lugs or trunnions and single axial
20 restraints, but then there are other considerations,
21 design considerations that are made to account for any
22 unbalanced loading. And we pointed this out to
23 CYGNA, too.

24 But, but the trapeze configuration, especially
25 the one that's welded to the pipe, is a very, is unique

1 to Comanche Peak. I've never seen any design like that
2 before. So, as far as using standard industry
3 practice to model that particular restraint, I would have
4 to take caution of that particular support configuration,
5 mainly because even though you're angular rotations are
6 small, the displacements where the struts attach to the
7 beam itself may be large because of the large radius.

8 MR. IOTTI: Okay. I understand, but Gibson
9 Hill and correct me if I'm wrong here, but where the
10 letter arm was long enough. you know, where they had
11 long trunnions, that Gibson Hill did not make the
12 assumption of modeling it as a single axial restraint,
13 either.

14 They did consider the fact that you would
15 have the split, is, is where you're, you're talking
16 relatively short trunnions that we're discussing here.

17 MR. TERAQ: Well, that definitely should have
18 been in the write-up because in the write-up there is
19 no mention of taking credit or modeling in longer arms.
20 And that is where the major concern would be, is in the
21 trapeze with the longer arms. There has to be some...

22 MR. FINNERAN: What we're saying, what we're
23 saying is that in some cases the analysts have chosen
24 to model these in to the analysis. I don't know what
25 their criteria for doing so was or even if they have a

1 written criteria. I think that's a matter of looking at
2 the arms and at the rotations that the piping analysis
3 would predict and make a decision that we ought to
4 model these in as, as restraints.

5 And they have done so.

6 MR. FLECK: Yeah. Some of the plants, the
7 79-14, they've done that.

8 MR. FINNERAN: Well, we've done that.

9 MR. FLECK: We've done it on (inaudible).

10 MR. FINNERAN: Again, the original anaylsis,
11 the piping person doesn't know whether you're going to
12 have a single strut or double strut, and he puts it
13 in as a restraint in one direction.

14 Then the 79-14 always comes back as built
15 (inaudible).

16 MR. FINNERAN: That's precisely what
17 happened with us. When they did see in our 79-14
18 copies of the drawings and the supports were supplied
19 by the analysts.

20 MR. FLECK: So, that's, that's where the
21 fact would come back where the piping analyst now
22 would have to evaluate whether or not there is a
23 sufficient tordinal (ph) restraint for that size
24 pipe, and he would have to model it in, then.

25 MR. FINNERAN: In fact, for some of ours,

1 they have decided that it would be significant and have
2 modeled them in.

3 MR. TERAQ: Yeah. Well, I think that's part
4 of our problem is, I understand when you keep saying
5 some of, some of the time they do it. I think what we
6 want to know is, we would be concerned where they don't
7 do it.

8 If there's no written criteria, I agree that
9 it's up to the engineer to, for him, for himself to
10 make that decision, but on the other hand, when you're,
11 when you end up with restraints that are different in
12 the industry, what one engineer does, another engineer
13 may not.

14 And we're in this last phase now. We're
15 in the as-built check, where this is the, this is the
16 last chance they have to take account of any of these
17 problems.

18 Now, just for the fact that you say you have
19 seen it done, I don't think that's going to fly as
20 far as the final as-built check. We have, we have to
21 understand where there could be a problem.

22 MR. IOTTI: Well, I don't see what else we
23 could do other than give you the complete list of
24 everyone of them and tell you, you know, what's been
25 done or as the case may be, what hasn't been done.

1 And for the cases where it hasn't been done,
2 is how does that support...

3 (CHATTER)

4 MR. BURWELL: Gentlemen, there's an awful
5 lot of conversation going on amongst the different
6 members, and I guess I was guilty of that, too. Where
7 are we? Are we not at a place that you could submit
8 the table, I assume? Does that clear up your statement,
9 Dr. Chen?

10 DR. CHEN: No, I think we have a little bit
11 more in the way of a request, and we're trying to
12 formulate that at this point.

13 Can we just take a break?

14 MR. BURWELL: Okay. Off the record.

15 (OFF THE RECORD)

16 MR. BURWELL: I believe Mr. Terao has a
17 statement to make.

18 MR. TERA0: We just had a discussion and I
19 think in general what we're saying at this time is
20 we can't accept a summary disposition the way it's
21 written, and we're going to need quite a bit more
22 information before we can attempt to start addressing
23 where we feel the real problems are because at this
24 point, we don't know exactly how big the concern is.
25 We don't know to what extent our concerns are even

1 valid.

2 The first thing that we really need is, is a
3 listing, let's say a quantification of the different
4 types of axial restraints that are in the plant. Your
5 Figure 1 which shows the Type 1, Type 2 and Type 3
6 restraint are, we might start at that point. And if
7 you can at least tell us how many in Unit 1 and also
8 in Unit 2 there are, that would at least provide a
9 starting point.

10 What I'd like to discuss is a little bit of
11 our concerns with each of those types and perhaps in
12 that sense you might be able to address those concerns
13 from a generic standpoint on how it was addressed in
14 design.

15 Okay. Starting with the Type 1, this is the
16 trunnion with the trapeze, using either snubbers or
17 struts. Our concern here, as pointed out earlier, is
18 the fact that the snubbers and struts are not allowed
19 by three times the design allowable increase. And what
20 we would like to know is what the impact of the
21 rotation can be on the snubbers and struts as far as
22 overloading them.

23 And I would also like to point out that
24 the rotation has to be combined with the axial loading.
25 I, I understand your point of the conservatism involved

1 but then, again, with, even with the standard response
 2 spectra (ph) analysis, we don't accept the decoupling
 3 of the rotation from displacements.

4 So, I, I understand the conservatism
 5 involved, but I can't...

6 MR. FINNERAN: Why do you say that that
 7 allowable is not applicable to standard components?
 8 As I recall the '74 code, that paragraph applies to,
 9 and I wish I had a copy of the code...

10 MR. TERA0: I have that section, if you like.
 11 The '74 code says you're allowed three times the
 12 allowable design limits of Appendix 17-2000.

13 MR. FINNERAN: Right.

14 MR. TERA0: Appendix 17-2000...

15 MR. FINNERAN: Those, those design limits
 16 in Appendix 17-2000...

17 MR. TERA0: Are design limits based on linear
 18 elastic analysis. The component standard supports
 19 are not designed using the linear elastic analysis.

20 MR. FINNERAN: Aren't, aren't the methods
 21 for determining the capacity of standard component
 22 supports spelled out in 17-2000?

23 MR. TERA0: I'm sorry, I, I don't understand.
 24 What was the question?

25 MR. FINNERAN: The methods for determining

1 the allowable loads for standard component supports
2 are spelled out in Section 17-2000. So,...

3 MR. TERA0: No, they're spelled out in NF.

4 MR. FINNERAN: That's what I want to check.

5 MR. FLECK: What is that paragraph? I
6 don't have the...17-2000.

7 MR. FINNERAN: 17-2000 is what we need.

8 MR. FLECK: Yeah. It's all right.

9 MR. FINNERAN: I think you're right. You're
10 right. And I withdraw my comment.

11 MR. TERA0: One area with these trapeze type
12 supports that we would like addressed is, first of all,
13 if you can tell us what the maximum rotations can be
14 or typical rotations and what is the worst case length
15 of the trapeze itself. Then determining what the
16 displacement can be at the support itself.

17 One thing you might want to take credit for
18 or at least consider is the loss motion in the
19 snubbers themselves. In other words, if the angular
20 rotation of the trapeze is less than the, the loss
21 motion of the snubber, of course, there is no additional
22 loading due to rotation, but that would not apply to
23 struts. With struts there is really no gaps.

24 MR. IOTTI: Haven't seen one yet (inaudible)
25 but that's okay. I understand.

1 MR. TERA0: All right. One thing we have not
2 discussed before but one of my primary concerns was
3 that with this particular arrangement, that was not
4 addressed in the summary disposition, are the local
5 stresses on the pipe. And I think this is one of the
6 major concerns with this design.

7 MR. IOTTI: I thought that we had addressed...
8 oh, I guess not. We did this for the lug.

9 MR. TERA0: There was a Gibbs and Hill analysis
10 would show that there is no increase in general bending
11 stresses, but I don't believe the concern was even
12 the general bending stresses and the piping system. It's
13 the local stresses...

14 MR. IOTTI: Secondary and local.

15 MR. TERA0: ...induced into the pipe. And it's
16 my opinion at this time that probably this Type 1
17 trunnion will give you the most problems of the, of
18 the three. And I would like to see the write-up,
19 specifically, addressing this trunnion in detail.

20 With the other two trunnion types, this is
21 the Type 2 trunnion which is simply a two trunnions,
22 180 degrees apart with snubbers or struts. This was
23 addressed by CYGNA.

24 One area that we'd like addressed there, in
25 particular, is what is the maximum length of that

1 trunnion?

2 MR. IOTTI: Aren't you really interested in
3 what is the maximum deflection as opposed to the
4 maximum length?

5 MR. TERAQ: Yes, basically.

6 MR. IOTTI: This is Bob Iotti. I was asking
7 Mr. Terao whether, what he's really interested in is,
8 in fact, the maximum deflection at the location of the
9 support on the trunnion as opposed to how long the
10 trunnion is.

11 Because if there is no rotation, it really
12 doesn't matter how long it is.

13 MR. TERAQ: But the reason why I, I asked
14 for the length is because in looking at Type 1, you may
15 be able to determine what is a typical or maximum
16 bounding rotation of the pipe, in general. And once
17 you know what that would be, you could at least determine,
18 knowing Type 2, what the...if you know what the
19 trunnion length is, then you can determine what the
20 displacement is.

21 MR. IOTTI: Oh, I don't think we're going to
22 do that, Dave. The, the pitfall for doing that is that
23 you're going to be mixing a very large rotation which
24 occurs for a very short trunnion, with a very long
25 trunnion where there may not be a rotation. And you,

1 and you're creating for yourself a problem that does
2 not exist. So,...

3 MR. TERAQ: Well, okay. That, that may be
4 true. I...

5 MR. IOTTI: We're already, we think,
6 conservative and we're adding further conservatisms on
7 and that could lead us into answers that are incredible.

8 MR. TERAQ: I guess what I'm trying to do
9 is shorten the process. Of course, the alternative
10 is to look at every one of these and what we're trying
11 to do is at least screen out where the problems can
12 be and then we can focus on those that we feel there
13 is concern.

14 But I, I agree with you. What we are really
15 interested in is the displacement at the attachment
16 of the snubber or strut to the trunnion.

17 UNIDENTIFIED SPEAKER: Would you want the
18 rotation at the same time because that's what's
19 causing the displacement?

20 MR. IOTTI: Well, what you will, what you
21 realize is that in order for us to give you that
22 information, we have to look at every one of them in
23 any case to determine where, where are the rotations,
24 how large are they, and, in fact, pick the maximum.

25 This is what we did for the trouble trunnion;

1 we identified every single one of them in Unit 1 and
2 (inaudible).

3 MR. TERAQ: I see.

4 MR. IOTTI: Okay. So, we'll just do the
5 same thing for, for the other types and give you all that
6 information.

7 MR. TERAQ: Fine, that would be the best
8 way.

9 MR. IOTTI: If you have that concern, we
10 want to lay your concern. We're not trying to minimize
11 the work. We're trying to satisfy you that there is
12 no problem in the plant.

13 MR. TERAQ: And as far as the Type 3 type
14 trunnion, it's basically the same concerns as the
15 Type 2, but I would like to point out, again, that,
16 that what CYGNA had looked at was mainly Type 2 and
17 Type 3. And there's been a lot of discussion regarding
18 Type 2 and Type 3, but what they're, what has not been
19 discussed in detail is the Type 1 trunnion. And I
20 think this is probably the worst case trunnion.

21 MR. IOTTI: Okay. We'll have to provide you
22 with that information. Obviously, we don't have that
23 with us today.

24 (PAUSE)

25 (CHATTER)

1 MR. HORIN: Spot, could we go off the
2 record?

3 MR. BURWELL: Off the record.

4 (OFF THE RECORD).

5 MR. BURWELL: During the break, we had a
6 discussion of Figure 1 of the different types of
7 trunnions on the support. As a result of that
8 discussion, I believe Mr. Horin has a statement to
9 make.

10 MR. HORIN: During the break we discussed
11 the information that the staff has requested with
12 respect to the different types of supports identified
13 in a figure included with our affidavit regarding the
14 axial restraints.

15 And the staff has questions with respect to
16 each of the types of supports identified in that
17 figure. And applicants intend to provide information
18 to the staff to respond to their questions.

19 And there is an outstanding question which
20 we have not resolved but will resolve outside of this
21 meeting as to the precise scope of the motion and the
22 appropriate scope of the staff's response to the
23 motion.

24 I think at this point we should just move
25 on to the next set of questions.

1 MR. BURWELL: I think I need to make one
2 statement, and I think that is that the staff will, of
3 course, search out, pursue its concerns on this matter
4 to a final conclusion.

5 And with that, I think we're ready to move
6 on to the next question.

7 (PAUSE)

8 MR. TERAQ: Okay. Well, I guess most of
9 our concerns were with Type 1 restraints, and we did
10 have some questions about the Type 2 and 3, but I
11 think we did describe what we wanted addressed earlier
12 this morning on the Type 2 and 3 as far as the
13 rotations and displacements.

14 MR. IOTTI: You mean the rotation and the
15 displacement and my understanding is that you also
16 wanted to have the detail out of all of those that we
17 looked at as to whether, where, what the weak link
18 was.

19 MR. TERAQ: Right, as far as...

20 UNIDENTIFIED SPEAKER: The ones that would
21 have exceeded the normal allowance?

22 MR. TERAQ: The ones that would exceed
23 the primary of the axial involved.

24 UNIDENTIFIED SPEAKER: Right.

25 MR. IOTTI: I just wondered, maybe we could

1 even make the copy because that exists already?

2 (CHATTER)

3 MR. IOTTI: Because we have all of the
4 rotations. These are, of course, the free rotations
5 except in those few instances where we went back and
6 remodeled the whole thing and also we have the actual
7 rotation when you put the rotation constraint in.

8 MR. TERAQ: Okay. Aside from that, we have
9 no questions on the lug portion of the write-up.

10 MR. IOTTI: Meaning that's acceptable or
11 not acceptable?

12 MR. FLECK: Right. It would be...as far as
13 what I have seen, I have no questions that would question
14 what you've done.

15 THE REPORTER: Would you speak up a little
16 bit, gentlemen?

17 MR. FLECK: Should I repeat that?

18 THE REPORTER: Yes.

19 MR. FLECK: On the lug portion of this item,
20 I have no additional questions. So, I would be
21 satisfied with what has been presented.

22 MR. TERAQ: I did have a few clarifying
23 questions. Maybe you could...on one of your tables,
24 Table 4, I wasn't quite sure of some of your notations
25 there.

1 MR. IOTTI: Table 4?

2 MR. TERAQ: On Table 4. There's...in the
3 fourth column, there's an L value. Could you describe
4 what that L value is?

5 MR. IOTTI: That's the length of the arm.

6 MR. TERAQ: That's what I thought it was.
7 And these, when you call these trapeze supports, are
8 these...this is not the single trunnion trapeze support.
9 These are the double trunnion?

10 MR. IOTTI: These are the double trunnion.

11 MR. TERAQ: Okay. I guess...

12 MR. IOTTI: Tied to a tree.

13 MR. TERAQ: I've never referred to those as
14 trapeze types. So, I was a little confused. So, L
15 is the length of the trunnion itself; correct?

16 MR. IOTTI: I think it's from the center
17 line of the pipe because the computer would measure
18 it from the center line of the pipe.

19 MR. TERAQ: From center line of pipe to
20 where the support is attached or to the end of the
21 trunnion?

22 MR. IOTTI: To where the support would be
23 attached.

24 MR. TERAQ: And just a clarification on
25 Table 2.

1 MR. FINNERAN: I think that L is the length
2 of the, the coupling length.

3 MR. TERAQ: The total.

4 MR. FINNERAN: It's the coupling length
5 between the compression and the...

6 MR. TERAQ: Length between the two supports.

7 MR. IOTTI: Let me confirm that for you,
8 Dave, okay?

9 MR. TERAQ: Oh, okay.

10 MR. IOTTI: But I believe...let me just
11 confirm it to make sure. I'll tell you in a second.
12 L is the total length of the space between supports.
13 Okay.

14 So, it would be twice that dimension I just
15 gave you.

16 MR. TERAQ: All right. Thank you.

17 MR. IOTTI: Let's see, Table 2, you said?

18 MR. TERAQ: Yes. On Table 2 it says change
19 of adjacent support loads for rotation of constraint
20 and on rotation constraint analysis.

21 Could you just explain just briefly what,
22 what this table is?

23 MR. IOTTI: Okay. When you have the piping
24 run, some of those supports will have a rotational
25 resistance and some of them do not. When we reanalyze

1 we distinguish between the affect on the support, the
2 trapeze type support itself and also the other
3 supports.

4 What, what this table is intended to show
5 is that the other supports are not affected. If there
6 is an affect of modeling in the rotation constraint,
7 it's strictly on the trapeze type supports.

8 MR. TERAQ: Okay. So, it's the affect on
9 the system of the trapeze type supports?

10 MR. IOTTI: Right.

11 MR. TERAQ: Okay.

12 MR. IOTTI: That's why you see three tables.
13 One is on the piping, one is on the other supports
14 and then the third one is the actual supports
15 (inaudible).

16 MR. FLECK: Okay. So, when you say that
17 these are the supports, immediately following or
18 preceding...

19 MR. IOTTI: All others (inaudible) whatever
20 they are.

21 MR. FLECK: That's what I thought.

22 UNIDENTIFIED SPEAKER: Excuse me. I'm not,
23 I'm not...I don't know if it's a problem with the air
24 conditioner here, but I'm having trouble hearing you.
25 Maybe you could turn the mikes (inaudible) would be fine.

1 MR. TERAQ: All right. That's it for axial
2 restraints.

3 MR. BURWELL: No further questions on
4 (inaudible)? All right. The next item I have is
5 local displacements and stresses.

6 MR. IOTTI: Before we go on to the local
7 displacement and stresses part, irrespective of what
8 is being, what would be decided on the Type 1, I have
9 an action item on Type 2 and 3 that I'm to provide
10 to you as soon as possible. And this is the rotations,
11 the deflection, the lengths for each one of the type
12 2 and 3 supports and the finishing of which of weak
13 links, you know, which one of those that would be
14 computed to exceed the old allowable values (inaudible).

15 Is that the only one that you have?

16 MR. TERAQ: Yes.

17 MR. IOTTI: Okay.

18 MR. CHEN: Is that basically going to be an
19 extension of that table (inaudible)?

20 MR. IOTTI: It is the table that I have.
21 It's just that we want to have a last opportunity to
22 go back and provide some clarifying statement to it.
23 And the table exists already.

24 MR. BURWELL: Okay. I have the local
25 displacements and stresses.

1 (PAUSE) 108

2 MR. BURWELL: Okay. I believe this is yours,
3 isn't it, John?

4 MR. BRAMMER: Yeah, are we ready to go?
5 I'm John Brammer from ETEC. And most of my comments are
6 on Finneran's affidavit and attachments that go with
7 it.

8 And to start out with, on Page 3 I'd like to
9 clarify the allowables that are used. Some of this
10 has gone on in the past that I've been cognizant to.
11 One thing I noticed, it says applicants have utilized
12 the conservative allowables employed by Gibbs and Hill
13 for assessing local pipe stresses.

14 Well, based on the affidavits, I assume this
15 is Equation 11 allowables?

16 MR. FINNERAN: Well, actually, it's a whole
17 set of, of allowables. It's Equation 8 and 9 and 11
18 allowables. Actually, they have...yeah.

19 MR. BRAMMER: Okay. But in the calculations,
20 you did, in your attachments you used 11 all the time?

21 MR. FINNERAN: Yes.

22 MR. BRAMMER: For the pipe and 3SM for the,
23 the structure.

24 MR. FINNERAN: Except that the equations for
25 the assessment of these stresses have been adjusted as

1 Gibbs and Hill adjusted them in the allowables that they
2 have set up to assess the piping.

3 Our edition of the code...I don't know if
4 this is in the hearing yet or not, but our edition of
5 the code does not give any direct guidance or in
6 C for assessing these localized stresses in the piping.

7 So, Gibbs and Hill had come up with some
8 modified equations to use to assess the local stresses
9 and the piping. And that's the ones that we used. It's
10 the document that they've always used in...so, we
11 used those values.

12 MR. BRAMMER: Okay. Now, but in your calcula-
13 tions, didn't you use Equation 11 allowables?

14 MR. FINNERAN: These modified equation
15 11 allowables, okay.

16 MR. BRAMMER: Okay. Then another question
17 on this. You refer to ASME Code Section NF 32-31A,
18 governs the consideration of these types of stresses
19 box frames and so forth.

20 Well, according to that article, it says
21 but not thermal or peak stresses shall be limited to
22 three times the stress limits.

23 And this is what we're talking about,
24 isn't it, thermal and peak stresses?

25 So? Well, you explain it.

1 MR. CHEN: Just off the record.

2 (OFF THE RECORD).

3 MR. BURWELL: Okay.

4 MR. BRAMMER: Okay. Then the next bunch
5 of comments I have are on Page 5. You say the results
6 of that analysis demonstrated, even when including
7 local stresses included in the frame from the thermal
8 expansion of the pipe are those...all stresses in the
9 frames are less than code allowables.

10 Well, I have some questions on your analysis
11 on that that we'll get to a little later. So, I can't
12 really buy that statement at, at this time.

13 MR. IOTTI: Which statement, I'm sorry?

14 MR. BRAMMER: The first paragraph up there
15 more or less.

16 MR. IOTTI: On Page 5, where...

17 MR. BRAMMER: Are less than...

18 MR. FINNERAN: Are you in the affidavit?

19 MR. IOTTI: Yes, he is.

20 MR. BRAMMER: No, I'm still on, on your...
21 we can go to the affidavit now and I'll my discussion
22 on that...

23 MR. IOTTI: The affidavit.

24 (CHATTER)

25 MR. BRAMMER: Oh, yeah, the affidavit. Excuse me,

111

1 yeah.

2 UNIDENTIFIED SPEAKER: Page 5, about four lines

3 down from the top?

4 MR. IOTTI: We're in the motion so I guess...

5 I think you're reading from the motion.

6 MR. BRAMMER: Well, let me read it. This is

7 the affidavit.

8 UNIDENTIFIED SPEAKER: Page 4.

9 MR. IOTTI: Yeah, I thought that was really

10 domething different?

11 MR. BRAMMER: Okay.

12 MR. IOTTI: And you say you cannot buy that?

13 MR. BRAMMER: Not...I have some questions

14 on...

15 MR. IOTTI: We'll get into it in the analysis,

16 I gather?

17 MR. BRAMMER: Yeah, in the analysis.

18 UNIDENTIFIED SPEAKER: Could you just explain

19 on that same statement what class we're talking about

20 there? What class piping? Is that Class 1 or Class 2

21 and 3?

22 MR. FINNERAN: This particular frame is

23 on Class 2 and 3 piping.

24 MR. BRAMMER: Okay. Then there's a statement

25 ...

1 MR. TERAQ: Are you done, Dave, or you
2 have...

3 MR. IOTTI: Yes.

4 MR. TERAQ: So, are you saying there's no
5 frames on Class 1 piping?

6 MR. IOTTI: Yes.

7 MR. BRAMMER: Okay. And then you have a
8 statement here, I should note that these loads and
9 stresses would be greater than those encountered in
10 the other supports of this type because of the higher
11 temperature of this pipe and the fact that the pipe is
12 stainless steel and the greater thickness of the pipe
13 affording less flexibility and thus employing greater
14 loads.

15 I think that that's too general a statement.
16 It looks to me like you do have a thicker pipe. Right,
17 it is stiffer. If you go to a thinner pipe, it's less
18 stiff but it also will take a lot less load.

19 I think it depends on the individual...

20 MR. FINNERAN: I, I think I disagree with
21 that. The load generated is based upon the (inaudible)
22 flexibilities between the piping and the support.

23 MR. BRAMMER: That's right, yeah, and there's
24 no doubt about that.

25 MR. FINNERAN: The stiffer the pipe, the

1 higher the load that would be generated.

2 MR. BRAMMER: But with a thicker pipe, the
3 pipe could take a higher load without being over-
4 stressed by ...

5 MR. IOTTI: I think he's not disagreeing
6 with the loads being higher. He's disagreeing with
7 the stresses being greater.

8 MR. BRAMMER: No, I know. The stresses
9 could be higher.

10 MR. IOTTI: The load is related to the
11 stiffness and the capability of the (inaudible) and the
12 stresses also related to the thickness of the pipe.

13 MR. BRAMMER: Right, right.

14 MR. IOTTI: The two kind of go hand in
15 hand. And we have convinced ourselves that this
16 statement was true. So, we'll have to...

17 MR. BRAMMER: Also, the stiffness of the box
18 frame will vary between supports, too, and that will
19 have an affect on it. So, I think this is a little over-
20 generalized here.

21 MR. IOTTI: Well, is there any specific
22 action item that you want from us with regard to this?
23 Do you want us to further justify why the statement
24 was made by example?

25 MR. BRAMMER: Yes. Okay, then, okay. On

1 Page 6 it's the same type of statement under the last
2 sentence on your answer; by taking this conservative
3 approach, we have also effectively bounded the remain-
4 ing supports on low temperature lines.

5 Again, you've done one support and I don't
6 think you can do it with one support because, again,
7 it depends on the pipe size, the pipe thickness,
8 support stiffness.

9 MR. IOTTI: I guess we'll answer that one the
10 same way as the former one.

11 MR. BRAMMER: Yeah.

12 MR. IOTTI: We'll give you more than one
13 example. Okay. And try to pick the two bounding cases.

14 MR. BRAMMER: Okay. Then on Page 8, okay.
15 Again, I have some questions on the attachments on the
16 analysis, so that the statement at the, to the answer
17 at the bottom of Page 8, I'm not sure that I can
18 agree with at this time.

19 MR. BURWELL: Well, I take it we will go
20 into these questions of yours when we get over in
21 the later...

22 UNIDENTIFIED SPEAKER: (Inaudible).

23 MR. HORIN: What is the specific statement
24 he had a question on?

25 MR. BRAMMER: Their, their results also

1 demonstrated all stresses in the frame and (inaudible)
2 were far below the allowables used by CYGNA.

3 And then the same, the same is true up in
4 Answer A up at the top, as shown in the attached
5 analysis, Attachment C, D, and E, inclusion of the
6 thermal expansion affects of the pipe with other loads
7 and assessment of the anchor result in no over-
8 stressed conditions.

9 MR. IOTTI: I'm a little confused as to why
10 you quarrel with the, on Page 8. All we're saying
11 here is the CYGNA analyzed the similar supports, and
12 what they found for that support was that their stresses
13 were below their allowables.

14 MR. BRAMMER: Yeah. I, I guess what I'm
15 really questioning is at the top of the page.

16 MR. IOTTI: Oh, okay.

17 MR. BRAMMER: On the answer there.

18 MR. IOTTI: I, I may be looking in the wrong,
19 wrong place.

20 MR. BRAMMER: Yeah, okay. Okay. On Page 9,
21 these stresses are right, in the last answer on
22 Page 9. These stresses are assessed by each of the
23 support design organizations on a case by case basis
24 when deemed appropriate by the engineer.

25 Is there some screening criteria or something

1 that you have or is it just each individual's judgment
2 that goes into that?

3 MR. FINNERAN: Well, each, each group has
4 a little different approach to them. Let me take just
5 a second here to make sure where we are.

6 (PAUSE)

7 MR. FINNERAN: ITT, as we state later on
8 Page 10, ITT uses the AWS approach in 10.5.1.

9 MR. BRAMMER: Yeah, that's on the ones they
10 decide to analyze, I take it.

11 MR. FINNERAN: I think they...well, I can't
12 answer that one, specifically, because I, I think they
13 assess them pretty often in their calculations. They
14 have an engineering standard that they developed,
15 utilizing the AWS approach. And it's utilized quite
16 a bit. So, it's...there probably is some judgment
17 exercised by the engineers whether to always do the
18 calculations or not if the loads are very well, but
19 the calculations are done quite often.

20 In the case of NPSI, in their design guide-
21 lines they have some general statements about using
22 reenforcing plates if deemed necessary by the engineer.
23 And there's not very much precise guideline beyond that.

24 In the case of PSE, we really don't have
25 anything written down like ITT or NPSI has that would

1 serve as guidance for the engineer as to when he should
2 do them and when he should not. So, I would say in
3 those cases it, it is left up to the judgment of the
4 engineer.

5 UNIDENTIFIED SPEAKER: Do you have a problem
6 with that?

7 MR. BRAMMER: No, I just was curious as to
8 what, what their criteria was.

9 Okay. On Page 11 where you're talking about
10 this tube to tube ratio, where CASE said it was less
11 than .4, looking at your drawing, the dimensions of that,
12 that end bracket is 4 by 2-7/8 inches. So, depending
13 on which way the bracket sits on the tube steel, they
14 could be right or...

15 MR. FINNERAN: I don't know where you got
16 your dimension, but the dimension was 4-1/2. The
17 dimension that runs across the tube steel on the
18 bracket was 4-1/2.

19 MR. BRAMMER: Okay, in one direction, but
20 it's 2-7/8 in the other direction.

21 MR. FINNERAN: Yeah, well, the direction
22 we're talking about here as far as the ratio is
23 across the tube steel.

24 MR. BRAMMER: It's set so that it is across
25 and not turned the other way?

1 MR. FINNERAN: That's correct. The 4-1/2
2 dimension is across the tube steel, across the 8 inch
3 width of the tube steel.

4 MR. BRAMMER: Okay.

5 MR. FINNERAN: If you...don't we have...isn't
6 that attached?

7 MR. BRAMMER: Yeah, yeah, that's where I
8 got it.

9 MR. FINNERAN: I could show it. I could,
10 I could make that clear for you if you wish.

11 MR. BRAMMER: The bracket is, the picture
12 of the bracket is attached.

13 MR. FINNERAN: Yeah, I could show you.

14 MR. BRAMMER: There's also a page out of
15 the vendor's catalog, I believe. You can see that the
16 dimension we want is that dimension in and out of a
17 page, okay.

18 So, if you drew a picture of the bracket,
19 here's the bracket, and that would be looking at it
20 like this, okay. Okay. And if you go to the vendor's
21 catalog sheet or this bracket, you see that the dimension
22 we want is d). You mention d)?

23 UNIDENTIFIED SPEAKER: Yeah.

24 MR. BRAMMER: Okay. You want that dimension.

25 MR. FINNERAN: Okay, right.

1 MR. BRAMMER: And if you go...I've circled
2 d) for this number one (inaudible) and it's 4-1/2
3 inches.

4 MR. FINNERAN: Okay. This is the one I was
5 curious about because that's 2-7/8...

6 MR. BRAMMER: Yeah.

7 MR. FINNERAN: ...as near as I can read it.

8 MR. BRAMMER: Yeah. Well, that wouldn't
9 be a ratio. I don't know what you would ratio it to
10 because that's along the whole...

11 MR. BRAMMER: Yeah, because that doesn't
12 matter there. Okay. Then a question on this Table 1.
13 You have a list of stresses there. What, what loads
14 are included when you determine these stresses? Does
15 this include the local stresses due to thermal expansion
16 in the, in the zero gap supports or the whole bit or
17 is it just...I guess...

18 THE FINNERAN: It seems to be the design
19 loads for the sports themselves, that we have the
20 design loads that we have gotten from the packing
21 analysts to assess these particular supports.

22 MR. BRAMMER: So, it doesn't include any
23 stresses or loads that you would get due to this zero
24 clearance wall to wall analysis that you do? It's just
25 your basic stresses?

1 MR. FINNERAN: I guess I'm not sure where
2 you're coming from on that question.

3 MR. BRAMMER: I think the question is, do
4 these stresses include the stresses due to constraint
5 of free end displacement?

6 MR. FINNERAN: Yes. These are, these are the,
7 these, I believe, are the Level C loads for these
8 supports. They come from the piping analysis and by
9 our design...we do. We do.

10 MR. IOTTI: Okay, but you don't have to.

11 MR. FINNERAN: No, we don't have to, but,
12 but our particular design spec includes for Level C,
13 the loading, the SSE load plus thermal plus dead-
14 weight.

15 MR. CHEN: Plus the affects of a constraint
16 of the...the constraint of the support.

17 MR. FINNERAN: Oh, no, no, not those. Not
18 those.

19 MR. CHEN: Yeah, okay. Yeah.

20 MR. FINNERAN: You're talking about the
21 radial, the radial thermal expansion of the pipe. No,
22 those loads wouldn't be in here. Let's see, what is
23 Table 1? Why do we reference that?

24 MR. BRAMMER: I think it's referenced on
25 Page 12.

1 MR. FINNERAN: Where?

2 MR. BRAMMER: Page 12, about two-thirds of the
3 way down, the first paragraph.

4 MR. FINNERAN: Okay. So, that's...what I
5 told you was correct, that the loads of these supports
6 were assessed (inaudible) the loads that came from the
7 piping analysis.

8 As far as the restrain of (inaudible)
9 displacement, it would be the axial expansion of the
10 piping that the piping analysts do. That constraint
11 of (inaudible) displacement is in these loads.

12 Now, we're talking here about stresses
13 induced and tube steel walls from, from attachments
14 to the tube steel, I believe. And I really don't see
15 what connection a radial expansion with piping would
16 have to those loads.

17 MR. BRAMMER: Well, it adds, it adds extra
18 ...this is...it adds extra loads to your tube steel;
19 right?

20 MR. IOTTI: Got radial expansion?

21 UNIDENTIFIED SPEAKER: Depends on a relative
22 stiffness.

23 MR. IOTTI: Depends on a relative stiffness.
24 I, I suspect that most pipe being far more flexible
25 than the ones (inaudible) restrain it or (inaudible)

1 very little to that restraint.

2 MR. BRAMMER: Well, yeah, we've gone through
3 a bunch of stuff here on zero clearance and determine
4 loads due to zero clearance.

5 MR. ICTTI: Yeah.

6 MR. BRAMMER: Okay. Now, these loads,
7 it seems to me, should be added to the, to the loads
8 that were used to calculate the stresses in Table 1
9 to get the whole picture.

10 MR. FINNERAN: Well, I don't believe that
11 any of these supports in Table 1 are on the nature of
12 a box frame around the pipe.

13 MR. CHEN: Okay. That may be I was...

14 MR. FINNERAN: All these are, these are
15 like a canterlever (ph) tube steel beam with a bracket
16 attached to the wall of the tube steel and then the
17 strut coming down with a clamp around the pipe.

18 So, those radial expansion affects from the
19 piping wouldn't, wouldn't have any affect on these
20 attachments.

21 MR. BRAMMER: Okay. On...are you saying, John,
22 that there would not be configuration where you had
23 a box frame around a pipe?

24 MR. FINNERAN: That's right. I don't think
25 any of these are that kind in Table 1. What we're

1 assessing here is attachments to the wall of the tube
2 steel like rear brackets.

3 MR. BRAMMER: Okay. On Page...

4 MR. FINNERAN: I think every one of these
5 are rear bracket type attachments, just about.

6 MR. BRAMMER: On Page 13, what's the basis
7 of this 16,1/16th inch deflection guideline? That,
8 it doesn't seem to me that that tells you much about
9 the stiffness of a support.

10 (END OF TAPE 3)

1 MR. CHEN: I think this was something which was,
2 this arose in the hearing before, this is the significance of
3 the 116 is the (inaudible) criteria and I think the position
4 of this package is really, the significance of this report
5 is really what matters and not what, the deflection of the
6 support is under the (inaudible).is.

7 MR. FINNERAN: You got to look at what we're address-
8 sing here. We're addressing an allegation by Mr. Doyle, that
9 related to the calculation of deflections. The allegations
10 in Mr. Doyles deposition are all centered around deflection
11 calculations, and that's all we're addressing here.

12 MR. TERAQ: Just to ease Johns' mind I just want
13 to point out that there's a separate issue on generics. The
14 difference is that the staff is addressed and John Fair has
15 addressed that point there, as far as differences used for
16 the support, so I think we should keep that separate from
17 what this particular issue.

18 MR. BRAMMER: So there's a 6th of an inch in the
19 generics difference will be covered in that, is that what
20 you're saying?

21 MR. TERAQ: Yes.

22 MR. BRAMMER: Okay, on page 14 down at the bottom
23 of the page, you say the actual difference of the support
24 is 1.347 times 10 to the 6th pounds per inch. Given that
25 the generic, and this is at the top of page 15 now, given

1 that the generic stiffness for this support is five times
2 ten to the 6th pounds per inch, the actual stiffness is well
3 within the acceptable range of stiffness, given that the
4 deflection is slightly more than 1/16th. I don't understand
5 that, it looks like your actual stiffness is about a quarter
6 of the generic stiffness, and that's an acceptable range.

7 MR. IOTTI: Well again to answer y'ur question, you
8 have to place it in two contexts, where does Mr. Dolyes
9 allegation come from, and what his concerns are, and what
10 we were able to prove to ourselves through a different item
11 of work which eventually was involved in his affidavit on
12 generic versus actual stiffness. To us, that work, is you
13 were to review that affidavit it would show that the dif-
14 ference which is less than a factor of five, in stiffness
15 there's not much difference in this pounds, at this range.
16 So it's in that context that you see the statement that that
17 is an acceptable range. Mr. Doyle is also concerned with
18 the 1/16th of an inch because he took that 1/16th of an inch
19 guideline ot be a sacred cow that could not be exceeded in
20 any case.

21 So you have to address the fact, of you know, so what
22 if you exceed 1/16th of an inch by a slight amount, there's
23 nothing magic about 1/16th of an inch to begin with.

24 MR. BRAMMER: Yeah, it doesn't seem like it means
25 much to me in any place.

1 MR. IOTTI: No but apparently Mr. Doyle misinter-
2 preted that as being an inflexible rigid rule that if you
3 exceeded 1/16th of an inch, something catastrophic is going
4 to happen to you, so this is why that statement was made, if
5 you care to add to it. But it really has to be read almost
6 together with that other affidavit otherwise it can't stand
7 on it's own.

8 MR. BRAMMER: Is this something that Fair is going
9 to handle, I guess?

10 MR. TERAQ: Yes.

11 MR. BRAMMER: Okay, well then I guess my next
12 comments are on the attachment A. The first question I have
13 is on the temperature distribution, you just assume a linear
14 temperature distribution across the tube steel and assumed
15 that that went the whole length of the support.

16 Well I'm not sure that that is conservative or not
17 because actually you have line to line contact on the tube
18 steel and by the time you get off to the corners you're
19 quite a way away from where your contact is so the temperature
20 would seemingly drop quite a bit, which could effect your
21 loads considerably.

22 MR. FINNERAN: Well keep in mind we're not trying
23 to do an exact analysis of this thing. We're trying to do
24 an approximate analysis by manual methods, so we've made some
25 approximations and some simplifying assumptions.

1 MR. BRAMMER: I'm just a little concerned on some
2 of these it may be a little over simplifying in this.

3 MR. FINNERAN: What was your comment again?

4 MR. IOTTI: Oh, I understand, at the line contact
5 this tends to overestimate the temperture in the pipe in
6 the region near the line of contact, you agree with that,
7 your question is, as you move away from the line of contact
8 and towards the edges of the box frame, this particular
9 approach may, in fact, underestimate, over estimate the
10 temperture and under estimate the restraining effect. Let's
11 see I think we did some work to prove to ourselves that this
12 was not that far off, I have to dig it up, because I had the
13 same question, at one time on it. I would agree that it's
14 not linear, but there's two compensating effects. One you
15 are over estimating the temperture near the edges, okay, and
16 that means you are under estimating the restraining effect,
17 on the other hand you are also under estimating the temperture
18 at the line of contact in this instance, and I don't recall
19 but on our computer we ended up with something which tended
20 to say the two in fact, were canceling out.

21 MR. BRAMMER: Well, if you could show me something.

22 MR. IOTTI: I'll have to go back and dig up these
23 calculations because this was not done just cavalierly as
24 this, 'cause I had questioned that approximation also, my-
25 self. So make an action item, I'll just have to dig it up.

CD/NRC106
tape 4
page 4

1 Peter may have it, we may want to call him.

2 MR. BRAMMER: Then you have a statement on the same
3 page, that the air film insullation effect is considered
4 actual tube temperture, actual tube temperture is much higher
5 thus this approach is very conservative. Well that seems to
6 be in conflict with your analysis, because what you did in
7 the analysis is you subtracted deflection of the tube ex-
8 pansion deflection from the tube from the net. Okay so if
9 you have a higher temperture you would be subtracting more
10 so the net deflection would be less, and you would have a
11 lower load.

12 MR. IOTTI: That's correct, that's why we say it's
13 conservative, 'cause we're over estimating the load by neglec-
14 ting that we're over estimating.

15 MR. BRAMMER: Well that's not the way, the actual
16 tube temperture will be much higher, 'cause then the thermal
17 expansion would be much higher and you would be subtracting
18 more.

19 MR. IOTTI: Correct, so the load would go down,
20 from the standpoint of load this approach is conservative,
21 from the standpoint of expansion of the tube it's not. That's
22 the way.

23 MR. FINNERAN: The problem here, you've got to look
24 at it as the interface between the tube and the pipe, and if
25 the tube heats up less, and it has more of a constraining

1 effect on the pipe and has higher load.

2 MR. FLECK: The colder it is the higher the load.

3 MR. IOTTI: Wait just a minute I just want to make
4 a note you need that additional calculation which shows the
5 delinear distribution of tube steel across and along the
6 tube steel, is reasonably appropriate.

7 MR. BRAMMER: Then down in item two here where you,
8 okay, where you calculated the pipe wall stiffness, this
9 formula is for a thin walled vessel and your R/T ratio is
10 not in the range of thin walled vessels.

11 MR. FINNERAN: Well I don't know, if you can say
12 it's for a thin walled vessel, this particular.

13 MR. BRAMMER: Well that's what Rorch says.

14 MR. FINNERAN: Well he says for an R/T greater then
15 ten, I don't know whether he catagorizes that as a thin
16 walled vessel, he just puts that as a peramiter.

17 MR. BRAMMER: Well that's what the formula in his
18 table, that I understood.

19 MR. FINNERAN: Well I'm looking at the formula and
20 I don't see any reference to thin walled vessel, it just
21 gives the R/T ratio.

22 MR. BRAMMER: Yeah, but when he gives the criteria
23 of his formulas they are for thin walled vessels with R/T
24 of greater then ten.

25 MR. FINNERAN: Well all I can state to that is again

1 where we were trying to do an approximation here.

2 MR. IOTTI: Yes, but we have some for the thicker
3 vessel too. I don't have Rorch with me, that's not the one
4 I used. Oh, I thought you were referring to the tube steel.

5 MR. BRAMMER: No, we're talking about the pipe, the
6 pipe wall stiffness.

7 MR. IOTTI: No wonder I couldn't connect the two.

8 MR. FINNERAN: I guess Johns' question goes to
9 justification of the use of this formula for R/T of 6.06.

10 MR. CHEN: Well I'll tell you where we were, in
11 looking at the Rorch formula's we looked at equation nine.

12 MR. BRAMMER: Yeah, that's for line contact, right.

13 MR. CHEN: Well no, the only difference I think in
14 equation eight and equation nine, is equation nine is for
15 closed in, you can see in the case of equation nine here,
16 it's for the closed in pipe, of length L, and for equation
17 eight it's open ended, length L.

18 MR. BRAMMER: As I recall for equation eight, the
19 L/R ratio was equal to 8, 18 or greater, equation nine should
20 give you the same results, according to the footnote on the
21 equation here. But again it's for thin walled vessels.

22 MR. CHEN: Well I don't see the same qualifer on
23 equation nine that, that he has put on equation eight, as
24 far as the R/T ration.

25 MR. IOTTI: It's a fact it goes through several

D/NRC
06

a 7
4

1 R/T's. Down to as low as 15. Well we'll get you the answer
2 on that.

3 MR. FINNERAN: Well our answer, actually the reason
4 for choosing eight was that it looked like it more closely
5 approximated piping being open ended then it did just closed
6 ended, so that's why we chose the equation.

7 MR. BRAMMER: Well I don't argue with the reason
8 why you chose that if it's applicable to this thick a walled
9 vessel, I'd like to have some justification for using it.

10 MR. FINNERAN: Well I'll get back to you because
11 I know we did something we'll just have to dig it up.

12 MR. BRAMMER: Okay, on page 5 this same thing
13 applies again,

14 MR. IOTTI: Yeah, it would apply throughout. That's
15 the one that we couldn't find the one for a thick walled,
16 the one for localized stresses, it may have been that we
17 ended up with all of it for consistency, rather than mix and
18 match.

19 MR. BRAMMER: Okay, then on page 7, maybe this
20 has something to do with the Gibbson Hill allowable
21 that you were talking about earlier, for equation nine, it
22 looked to me like you could of used a higher (inaudible) at
23 1.8 sh, but not greater then 1.5sy.

24 MR. FINNERAN: Well that's why we said, in the affi-
25 davit that we used the conservative Gibbson Hill allowables

1 for this approach.

2 MR. BRAMMER: But that comes out of the Gibbson
3 Hill?

4 MR. FINNERAN: Yes, it comes out of the Gibbson
5 Hill procedure, and they've taken a conservative approach to
6 establishing allowables for those stresses.

7 We need to give you a copy of this Gibbson Hill
8 approach.

9 MR. BRAMMER: Is that the, the same would be true
10 for equation nine E on page 8.

11 MR. FINNERAN: Yes the same thing.

12 MR. BRAMMER: Okay, I have a question here the
13 thermal stresses is determined with a calculated P load of
14 31814 pounds which you came up with, if you use that in all
15 these other values you put in, it doesn't meet equation 10,
16 it meets equation eleven and even your reduced value of equa-
17 tion eleven, but the termal stresses don't meet equation 10.

18 MR. FINNERAN: Well as I explained to you we used
19 the Gibbson Hill approach, it doesn't have an equation 10 in
20 their approach. I'm not sure if it explains why, but ...

21 MR. BRAMMER: Well according to the code it's okay
22 to go with equation eleven, but you have to meet equation 10
23 too, I mean you have to meet the requirements for equation 10.

24 MR. FINNERAN: I guess I don't have an answer for
25 you on that one.

1 MR. TERAQ: Is this calss two and three?

2 MR. FINNERAN: Yes.

3 MR. TERAQ: I don't believe the code says you have
4 to meet equation ten.

5 MR. IOTTI: I thought you could go to equation 11,
6 could I see the code?

7 MR. FINNERAN: Well that would explain why there's
8 no equation 10 in the Gibbson Hill. I think it's the other
9 way around, I think it's the other way around from what you
10 said. Maybe we should go off the record here.

11 MR. BRAMMER: I guess we can say that that was
12 answered satisfactorily.

13 MR. BURWELL: During the record we pulled out the
14 code and determined that the criteria was that you need to
15 meet either equation ten or eleven and that has since been
16 confirmed by Mr. Brammer.

17 MR. BRAMMER: Alright attachment B is next, and
18 the only comment I have on that is that the temperture dis-
19 tribution is different then what was assumed here, the loads
20 could change, but even I, ran a quick calculation and used
21 seventy degrees for the temperture and the load only went
22 up to 852 so, there's no problem.

23 Okay, then attachment C, the formula in Rorch by
24 the way it's written out is for a small concentrated load,
25 this doesn't appear to be to me a small concentrated load.

1 the load is spread over a considerable area. I'm not sure
2 how applicable that formula is again, due to that fact.

3 MR. FINNERAN: Well I hope you can appreciate the
4 effort of trying to access these things without going to a
5 full blown finite element analysis of the thing.

6 MR. BRAMMER: Sure I understand that, but that
7 doesn't seem that that is really applicable to this situa-
8 tion. You know, you've got two eight inch pipes pushing
9 down on it.

10 MR. IOTTI: Well let's include that as part of the
11 laundry list that we'll provide explanations why we think
12 it's a reasonable approximation, even though it's not
13 precise, the approach.

14 He has questioned the applicability of the formula
15 used to determine the stiffness of the pipe which was dis-
16 tracted from table 31, page 8 of Oroch and Young, because
17 that formula is apparently, is for a localized load, where-
18 as, one could question whether the load, the local loads
19 here transmitted to the pipe in question is, in fact, local-
20 ized since it's transmitted by a set of four eight inch
21 pipes, and we are going to provide an explanation as to
22 why we feel it's still appropriate to use that formula for
23 the purposes of this calculation.

24 MR. BRAMMER: Okay, then another question I had
25 on that when you were applying this stiffness formula in

C 106
4
11

1 determining your wall thickness you included the wall thick-
2 ness of the pipe, plus the thickness of the doubler or
3 saddle underneath of that.

4 MR. FINNERAN: Yep.

5 MR. BRAMMER: I realize this sketch is not to scale
6 but it looks like the doubler is very small, it doesn't
7 extend much beyond the pipe that's loading it.

8 MR. FINNERAN: Well on calculating this particular
9 stiffness, wouldn't that be a conservative approach.

10 MR. BRAMMER: It would be a conservative approach
11 in calculating the stiffness but when you come to determine
12 the local stresses, if you use that double thickness it
13 would be very un nservative.

14 MR. FINNERAN: Well would it be unconservative or
15 would it not? I think the basis for the equation that we
16 used to determine the localized stress came from the Beam
17 and Elastic foundation theory, and I think the points, of
18 high concentrated stress in this case would exist in the
19 area of the pipe where it was reinforced with that(inaudible).

20 MR. BRAMMER: Well what you used is the equations
21 from this (inaudible) 107.

22 MR. FINNERAN: Yeah, and that's, those equations
23 were developed from Elastic Beam, I mean Beam and Elastic
24 Foundation Theory.

25 MR. BRAMMER: Okay, but it seems to me that this

1 doubler, if this sketch is anywhere near being close is
2 part of the trunyan(ph) it's not part of the skin.

3 MR. FINNERAN: It's welded to the pipe.

4 MR. BRAMMER: Well yeah, but it's very local, you
5 may get your maximum stress in the pipe just at the edge
6 of the doubler and the doubler and ends.

7 MR. FINNERAN: In our looking at the theory of
8 Elastic, Beam and Elastic foundation theory, the, the stress-
9 es peaked right under the externally applied load, and then
10 drop off very quickly, away from that point, or we wouldn't
11 agree that the maximum stress point would be out there.

12 MR. BRAMMER: Well I guess I'd like to see how big
13 this doubler is, how far it extends. You're right the
14 stresses do drop off very fast, but again this looks to
15 me like it's part of the loading mechanism and not the re-
16 sisting mechanism.

17 MR. FINNERAN: Alright, by the fact that they're
18 welded together you can't ignore that fact.

19 MR. BRAMMER: Well, right, right. But if the doub-
20 ler is part of the load that's applying the pipe then the
21 peak stresses would be right at the edges of the doubler.

22 MR. IOTTI: Yeah, as far as the Beam and Elastic
23 foundation, that would also be those results.

24 MR. FINNERAN: You'd like to see physically how the
25 pad is attached.

1 MR. BRAMMER: Yeah, some sort of justification
2 for doing it that way. Okay, on page 4, I think maybe you
3 were a little unconservative, the calculations are not shown
4 for the lower obstructogen(ph) but it appears that the
5 effect on the stiffness of the two 23 inch long, 18 inch
6 diameter pipe cantilever beam were neglected. That just
7 would lower your loads quite a bit really.

8 MR. FINNERAN: Well that would be conservative.
9 You said unconservative.

10 MR. BRAMMER: No, I meant to say conservative. Yeah
11 it dropped down 30% or better. Okay, well then on page 5
12 I had the comment about, again the doubler for saddle
13 thickness was included in determining the local pipe stresses
14 and I guess you're going to give me something to justify
15 that.

16 Again, okay, I guess that takes care of that one.
17 Okay, now on attachment D, again I have the same comment as
18 I had on, same formula right, and saddle thickness is again
19 included in the wall thickness. That's about it on that
20 one.

21 MR. IOTTI: Well I just wish, maybe can we go off
22 the record for a second.

23 MR. BRAMMER: Oh, on page 7, just, this is on D
24 still I was wondering if the, are the local stresses due to
25 dead weight, seismic thermal included in equation 11 stresses

1 stress where you come up with 30,502 PSI?

2 MR. FINNERAN: Yes, we've taken those stresses
3 and added them in. If you read this, paper by Gibson Hill,
4 we use these modified equations and those are included in
5 those equations.

6 MR. BRAMMER: Okay, Attachment E, again this one
7 does not, it's again a question with the stiffness calcu-
8 lation of the pipe being used. Two equations, it doesn't
9 fall within the thin walled criteria and the load is applied
10 over a, on a six inch pipe with a five inch pipe which I
11 wouldn't consider a concentrated load at all, that pretty
12 well covers the pipe. So, it doesn't look like this formula
13 applies again, for two reasons, and again the saddle thick-
14 ness was included in the overall thickness.

15 MR. FINNERAN: I think this one does meet the R/T
16 greater than ten criteria.

17 MR. BRAMMER: Well you say on page 2, it's 5.13.
18 That's when you include the saddle thickness and the...

19 MR. FINNERAN: Oh, I'm sorry. That's corrent. That
20 should be answered when we answer the other one.

21 MR. BRAMMER: Then you go to page four where you
22 check the local stresses with this WRC-107, these peramiters
23 don't fall within the limits of WRC-107. I'm not sure
24 that you're conservative or unconservative when you come
25 up with stresses that are out of the range of the curves.

1 MR. FINNERAN: Would you like us to address that?

2 MR. BRAMMER: Yes. Okay, on page 6, you have FB over
3 capital FB 2725, and that equation there, isn't this 2725
4 that's only the part of the load that from the stiffness
5 calculations, shouldn't there be other loads included in
6 that, in a normal ...?

7 MR. IOTTI: Could you repeat your question again
8 please, I'm confused, on page 6.

9 MR. BRAMMER: On page 6, the first equation there,
10 or the second one down, you've got a small fb over a capital
11 FB, equals 2725. That 2725 load is the load from the
12 stiffness, or stress from the stiffness calculations. It
13 seems that there should be other stresses or loads included
14 in that.

15 MR. FINNERAN: This old calculation is under an
16 area that, look back on page 5, it says check extra members
17 stress. Okay? So, on page 5 in the middle of the page,
18 right above A, it says check extra member stress. So
19 what we're calculating is the additional stress here due to
20 these thermally generated forces, and quite possibly it
21 could be a full explanation of the other stresses from
22 the other loads should of been included there, but this
23 thing says, it's characterizing that as only the extra
24 stresses.

25 MR. IOTTI: Well then it's no problem for us to go

110
1 back and give you the remaining stresses.

2 MR. BRAMMER: Then I guess by the same token where
3 you have the double asterick down there where it says extra
4 loading exsisting analysis you have 4,355 pounds, I was
5 curious as to where that came from because your calculated
6 load was 5,908 pounds.

7 MR. FINNERAN: Well I don't know the orientation
8 of this structure from our attachment here.

9 MR. BRAMMER: Well that's it I really couldn't
10 follow it from about page 5 on, I didn't, I just didn't
11 know exactly what you were doing, but the loads didn't seem
12 consistent.

13 I guess what I'd like is a little more explanation
14 from what is happening from page 5 to page 6.

15 MR. FINNERAN: Okay, it looks like the exsisting
16 analysis on this support, the loadings on it FZ, it looks
17 like that is a load in the same direction as the 5,980
18 pounds, calculated, right?

19 MR. BRAMMER: This 4,355 pounds you mean?

20 MR. FINNERAN: Right. So if that's the case, and I
21 believe it is, if you got an interaction back on page 6,
22 for 5,000 pounds of .108, interaction for 4,000 is going to
23 be something less then that, and the total of the two would
24 still be much less then 1.

25 MR. BRAMMER: Okay, then when you go to this sketch

1 on page 7, I can't hardly check any of those loads.

2 MR. FINNERAN: Those are the loadings on the base
3 plates, on the base plates. Right?

4 MR. BRAMMER: Right, but they should include, some-
5 where they should include the sum of this 5908 and 4355
6 right?

7 MR. FINNERAN: Yeah, I guess we owe you an explana-
8 tion or a clarification.

9 MR. BRAMMER: There's nothing, F, X, Y or Z doesn't
10 add up to 9,000 there.

11 MR. FINNERAN: Yeah.

12 MR. IOTTI: Let's take a look there, yeah that's
13 a neat trick, how did we get 5149 plus 4355 equals 6104?

14 MR. FINNERAN: That's 1749

15 MR. IOTTI: 1749.

16 MR. FINNERAN: Yeah.

17 MR. IOTTI: Those are the loads that you see reflec-
18 ted in page 7. The ones on the bottom of page 6 which are
19 the total loadings.

20 MR. FINNERAN: Well the key here is in the inter-
21 pretation of the note on the bottom of page 6, and (inaudible)
22 explained it to me at one time, and it's been so long ago
23 that I've forgotten it, so we're just going to have to get
24 an explanation.

25 R. BRAMMER: Yeah, maybe you could try to clarify

1 this whole section through page 10 because I couldn't really
2 follow it.

3 MR. FINNERAN: Alright.

4 MR. BRAMMER: Okay, then on page 11 where you solve
5 for F8 Prime stress there 4240 divided by 7.95 which is
6 the area of a five inch support pipe you have a load that
7 you calculated that's 5,900 pounds plus this exsisting
8 load, doesn't seem like everything is included in that
9 baby either. By the same token I'm not sure where some of
10 moments came from for the equation just below it, but, if
11 part of the load was left out of that one, it, there may
12 be some of it left out of the (inaudible) calculation.

13 MR. IOTTI: We'll just go back and provide the
14 explanation for this entire calculation.

15 MR. FINNERAN: Yeah, that's what my note says to do.

16 MR. BRAMMER: Okay, we'll that's really all I have.

17 MR. BURWELL: Would you all like to take a break
18 at this point in time, or keep going.

19 MR. BRAMMER: Do you have anything to add Paul?

20 MR. BURWELL: Did I head a yes or a no? Yes Okay,
21 off the record, break.

22 (Recessed)

23 MR. BURWELL: Do we need to sum up on the last
24 point?

25 MR. IOTTI: If you want I have a list of action

1 items that I jotted down this information that we need to
2 provide to the staff and their consultant for the local
3 displacement and stresses.

4 The first action item is on the affidavit, where
5 we are making a statement that on the basis of calculations
6 that we have done it should be obvious that the loads and
7 the stresses are conservative with respect to any of the
8 other similar type frame supports and we need to further
9 justify why the stresses would be greater. I think we've
10 concurred that the loads are, but the stresses it's not
11 immediately obvious.

12 The second action item I have is that we have to
13 provide the calculations, which show that the linear dis-
14 tribution of temperture in the tube steel across and along
15 the tube, is a reasonably appropriate approximation to make
16 from the standpoint of conservatism.

17 Then I have several action items which are related
18 to the same topic in reality and that is the use of a formu-
19 las from Rorch and Young, which is really a formula for
20 pipes which have ratios of, radius to thickness is excess
21 of 10 or 15, whatever, I don't remember which, it's ten,
22 and some of the example problems that were solved those
23 formulas have been applied for pipes which have smaller R
24 over T ratios and we have to justify why it is still appro-
25 priate to use those formulas.

1 We are to provide a copy of the Gibson Hill approach
2 on integral welded attachments for ASME code 2 and 3 pipes
3 and that document is called the verification procedure,
4 making a copy and providing it.

5 In addition there's another general comment which
6 is similar in nature to the use of the Rorch formula is
7 that in some instances when calculating the stresses on the
8 pipe, the pad of the particular support was added as part
9 of the thickness, and the stress was calculated through
10 that thickness and we need to justify why that might be
11 appropriate.

12 So those comments apply to attachment A, B, D and
13 E, on attachment E, in addition there is a question that
14 the calculated stresses fall outside the curves of the
15 welding research council bulletin 107 and whether it's
16 appropriate to use that particular document for the con-
17 clusions that we reach, and we have to justify that.

18 Finally we are to provide a, I don't want to
19 call it an expanded attachment, we need to provide an ex-
20 planation in the calculation that comprises attachment E
21 to permit the reviewer to follow through the calculations
22 as to where the numbers come from and so forth.

23 Those are the only action items that I have on
24 the local displacement of stress, have I left any out?

25 MR. BRAMMER: No that agrees with my list.

1 MR. BURWELL: With that I would propose that we go
2 on to the motion for summary disposition of case allegation
3 relating to differential displacement of large frame wall
4 to wall, and floor to ceiling pipe supports. This motion
5 was filed on June 22nd, 1984. I would hope that we are
6 able to complete that today. In any event, let's give it a
7 shot.

8 END OF TAPE.
9
10

1 CERTIFICATE OF PROCEEDINGS

2 This is to certify that the attached proceedings
3 before the NRC COMMISSION

4 In the matter of:

5 QUESTIONS ON SUMMARY DISPOSITIONS FILED BY TEXAS
6 UTILITIES ON COMMANCHE PEAK

7 Date of Proceeding: August 8, 1984

8 Place of Proceeding: Bethesda, Maryland
9 were held as herein appears, and that this is the
10 original transcript for the file of the Commission.

4 In the matter of: :

5 TEXAS UTILITIES GENERATING
6 COMPANY, et al. :

7 (Comanche Peak Steam Electric
8 Station, Units 1 and 2) :

: Docket Nos. 50-445
: 50-446
: ----- -X

9
10 7735 Old Georgetown Rd.
11 Room 1713
Bethesda, Maryland

12 Wednesday, August 8, 1984

13 Hearing in the above-entitled matter convened at
14 9:20 a.m.

15 APPEARANCES:

16 On behalf of the Applicants:

17 PAUL CHEN
18 WILLIAM A. HORIN, ESQ.
19 ROBERT IOTTI
JOHN FINNERAN
DAVID WADE

20 On behalf of the NRC Staff:

21 J. BRAMMER
22 HANK FLECK
23 DAVID TERAQ
JOHN FAIR
SPOTSWOOD BURWELL
24
25

1 MR. BURWELL: John, is this yours?

2 MR. BRAMMER: I'm going to defer to
3 Dr. Chen on this one. I think he has more background
4 on it than I do.

5 DR. CHEN: From a technical point of view,
6 in addition to what's already on the record, am I
7 correct, but the only thing that's added in here is
8 the conclusion regarding the adequacy of the..what's
9 this? ..15 supports that you looked at.

10 MR. FINNERAN: I would say is what the
11 affidavit does is pretty much like we characterized it.
12 It's the expansion of what's in the record, to include
13 all of the wall to wall, floor to ceiling supports for
14 all three pipe support organizations.

15 DR. CHEN: I think up to this point, floor
16 to ceilings were addressed in the hearings. The ones
17 in the service order tunnel.

18 MR. FINNERAN: I think we described in here
19 which ones were previously addressed.

20 DR. CHEN: And on page 7 I think, of the
21 motion, it says subsequently applicants have reviewed
22 all unit one and common safety related piping supports
23 and determined that there are 26 wall to wall and floor
24 to ceiling supports.

25 Four have slip joints, no, seven have slip

CS
NRC T5
1

1 joints, and four have small spands. Okay. And
2 fifteen have, the remaining have been evaluated and
3 found to be acceptable, considering the potential for
4 differential size and displacement.

5 So, the only thing new, here is, other
6 than what's in the record already, is the fact that
7 you looked at fifteen others and found them to be
8 satisfactory, is that correct?

9 MR. FINNERAN: Yes.

10 DR. CHEN: There's also one other item and
11 this has to do with the wall of the slab, wall to wall
12 to floor. The only request that I would have here
13 would be for you to characterize how close you were to
14 the other allowables, I guess for these fifteen. Do
15 you know how close you were to the allowables?

16 What is acceptable, what is the maximum?
17 For the worst case, how close were you to the allowable?
18 Were you 50% or what, do you have that number? Or can
19 you get that information?

20 MR. FINNERAN: Yeah, we have the number.

21 DR. CHEN: I mean, can you get that information
22 for us?

23 MR. FINNERAN: Uh-huh.

24 MR. IOTTI: This is for only, Dr. Chen, is
25 this only for the fifteen, or also for the wall to ceiling,

1 and ceiling to floor?

2 DR. CHEN: Just the fifteen. Yeah, I think
3 the others don't need..they have small spans and they
4 have slip joints, so you don't need to do anything with
5 those. I think these fifteen with the bounding, and
6 what I'm looking for is what the maximum is of these
7 fifteen.

8 MR. FINNERAN: Okay. I guess my impression
9 is, why, since this is an assessment of all the ones
10 we have.

11 DR. CHEN: Well, I just wanted to get a feel
12 for how close you were to the allowables, that's all.
13 That one would bound them all, is that correct? The
14 worst one here, would be the bounding case for all of
15 them?

16 MR. FINNERAN: That's correct, that's all you
17 got.

18 DR. CHEN: That's all I want. You know,
19 that's just a, that's the only information I need. I
20 want the worst one.

21 Okay, on page 9, also the motion, you talk
22 about differential seismic deflections for wall to slab
23 supports. It's mentioned there that you looked at three
24 of them, and they are mentioned there. They're
25 identified on page 8, of the affidavit. The question

CS
NRC T5
3

1 that I have there is, can you give me some idea of
2 how many of these kind of supports you've got in
3 the plant?

4 MR. FINNERAN: Well, there's more than these
5 three, and that's about the only exact answer that
6 I can give you. We have never attempted to count
7 them, nor do I really have any kind of feel for how
8 many there are.

9 We think that these three supports that
10 we analyzed are very representative of the, any of
11 the other supports that would be from wall to ceiling
12 or floor to wall.

13 DR. CHEN: Can you give me some idea of
14 how much along the wall or, do you have those drawings
15 here?

16 MR. FINNERAN: I think I have those drawings
17 here, but I'm not, it's not possible to bring all the
18 back-up material.

19 DR. CHEN: CC107, SWN?

20 MR. FINNERAN: Yes, I have the 132703 one
21 here, and it's, it extends, this is the drawing here,
22 and this one extends from the wall to about seven feet
23 out in the span of the slab. I don't know how far
24 down that goes. That's 804 to 806, that's a little
25 over two feet, from there to there.

1 DR. CHEN: Okay.

2 MR. FINNERAN: For that particular one, that
3 span out into that floor slab is..I think that whole
4 tunnel is probably maybe about 12 feet wide or something
5 like that.

6 DR. CHEN: Okay. Is that one just down
7 from two of the four that we talked about, in the hearings,
8 John?

9 MR. FINNERAN: Pardon?

10 DR. CHEN: Is that one in the same tunnel
11 that..

12 MR. FINNERAN: This is one of the four we
13 talked about, where we cut off the column legs. That's
14 the 132703 one.

15 DR. CHEN: Would it be easier, John, if
16 I said that you would just provide us with those?

17 MR. FINNERAN: Yes. We can do that. I
18 was hoping to find those here.

19 MR. IOTTI: Do you want the drawings for
20 these three supports?

21 DR. CHEN: Right.

22 MR. FINNERAN: I don't have them.

23 MR. BURWELL: Do the three supports cover
24 a different pipe sizes or, did you pick them because
25 they are large pipe sizes, or, you said they were

CS
NRC T5
5

1 representative of what's in the plan. I just wanted,
2 was wondering...

3 MR. FINNERAN: Well, the service water one
4 is a gain frame, and typically, several of these types
5 supports that do go from wall to ceiling, because of
6 picking up more than one pipe, they have a tendency
7 to do that sometimes.

8 DR. CHEN: What size pipes are those?

9 MR. FINNERAN: I think those are ten inch
10 pipes...service water pipes on there. Yeah, those
11 are ten inch pipes. And that particular one there
12 are four of them. Now, I've forgotten your question.

13 DR. CHEN: What do they spend on pipe sizes,
14 different pipe sizes..

15 MR. BURWELL: I was looking for why you
16 think the three selected are representative of worst
17 case things, and I think one of the points that you
18 brought out...that gang hangers would likely be more
19 of a, would demonstrate larger displacements that
20 would say, single hang...single to double hangers.

21 MR. FINNERAN: Well, the gang hanger would
22 tend to have a longer span, so it might tend to have
23 to attach from a wall to a ceiling. As far as the
24 representative nature of the rest of them, I would
25 say that the dimensions of these, and that seems to be

1 the characteristics that should be looked at, represent
2 the deminsions of the other supports that are of this
3 nature. The spans, how far out in the slab, or how far
4 down the wall they extend.

5 DR. CHEN: One of the analysis that you sub-
6 mitted, way back when, consisted of a prop cantilever.
7 There was a structural steel member, then cantilevered
8 from the wall, like there was a prop from the floor
9 up to that, to that steel member. Is that correct?

10 MR. FINNERAN: Well, you would have to get
11 more specific than that, I'm afraid. These service
12 water frames, they extended from the wall, and they
13 also had a column that came from the floor, a prop
14 that also went all the way up to the ceiling. And what
15 we ended up doing with those, and you're well aware,
16 we cut the columns off, so they wound up then, being
17 a ceiling to wall type of support, rather than a floor
18 to ceiling. That might be the ones that you're thinking
19 about.

20 DR. CHEN: No, what I'm thinking of is,
21 you have the wall here, and you had a cantilever sticking
22 out..and there was a prop, here, that went to the floor.

23 MR. FINNERAN: Oh, that. That was one of
24 the moment restraints, that was one that gives and held,
25 moment restraints.

1 There was a pretty detailed analysis of that.

2 DR. CHEN: The only remaining question goes
3 towards spots, was one of the spots raised earlier,
4 but are representative of these three, really, we need
5 to address that.

6 MR. FINNERAN: Well, we can provide some
7 more information along that line, when we provide you
8 the drawings.

9 DR. CHEN: I have no other questions.

10 MR. BURWELL: Okay. We have a request out-
11 standing on that, I guess, for the drawings, and some
12 explanation.

13 MR. IOTTI: There is a total of three that
14 I have. If we could keep going, and maybe we should stop.
15 The first one I have is for the fifteen wall to wall and
16 floor to ceiling. Which one is closest to allowables,
17 and how close is it?

18 MR. BURWELL: That's correct.

19 MR. IOTTI: And the second one is to provide
20 the drawings for these three supports, and the third
21 one is justify how representative they are.

22 MR. BURWELL: Yes.

23 MR. IOTTI: That's all I've got.

24 MR. BURWELL: With that, it is now..okay, I
25 have a vote to go, continuous stability I think, and

CS
NRC T5
8

1 with that I'll turn the questions over to Block.

2 UNIDENTIFIED SPEAKER: Well, this might
3 take awhile, so, it's not necessary that we cover it
4 all tonight, today.

5 MR. TERAQ: This is on stability, and I
6 guess before we get into the affidavit, in reading
7 your response on stability, I'm not sure exactly what
8 you're trying to say, but, perhaps, as an opening
9 question, I should just ask, is there a current problem,
10 now, with instability of any pipe supports?

11 MR. FINNERAN: No, I don't think there's
12 any pipe supports, that there is a problem with
13 stability.

14 MR. TERAQ: Okay. Has there ever been a
15 problem with instability?

16 MR. FINNERAN: Potential instability. The
17 box frames that we talked about. There were modifications
18 made to them to improve the potential instability,
19 aspects of them. And there were modifications made
20 to the..some of the main steam supports, which had gaps
21 in them.

22 MR. TERAQ: Well, I guess my question is
23 more to do with the way it's worded in the write up.
24 I don't think you ever stated, even that there was
25 a problem with instability. I think what you've said

CS
NRC T5
9

1 is that you've improved stability on these supports,
2 but I'm not sure if you ever, are saying that ever had
3 a problem with stability, instability, or whether or
4 not you just felt that the stability could be improved,
5 but you never did have a problem.

6 MR. FINNERAN: Well, I think the bottom
7 line to our testimony on these supports, would have
8 been that we believe that these supports would have
9 behaved in a stable manner, and that they would have
10 served their function. They would have functioned,
11 they would have carried the load that they were going
12 to carry. But, there was a question of those stability.
13 And, in lieu of trying to prove that they would have
14 behaved in a stable manner is it is more prudent for
15 us to modify the ones for which there was a question
16 of stability.

17 MR. TERAQ: All right. From the very start
18 of this issue, on instability or stability, I've always
19 had a problem with trying to define exactly what Case
20 meant by instability, and what the applicant has meant
21 by instability, what SIGMA has meant by instability, and
22 even what the Sit and the NSE stamp has meant by in-
23 stability.

24 It's always been a fundamental problem,
25 and until we get this thing, until we get the definition

CS

NRC T5

10

1 well defined, you see the problem is that if we can't
2 agree on a definition, then we can't agree that there
3 is ever a problem. So, maybe we should spend a little
4 bit of time trying to define what instability is. Let
5 me just point out, that when I first heard about the
6 problem of instability, the two classical definitions
7 of instability were, of course, buckling and the
8 second is the inverted pendulum type of instability
9 where the classical definition of that is of a system
10 is displaced slightly from it's equilibrium position,
11 does it tend to return to it's original position, or
12 does it tend to displace further, when the disturbance
13 is removed.

14 If it tends to return to it's original
15 position, the system is stable, and if it tends to
16 displace further, if the system is unstable.

17 Now, but those two definitions, when we
18 looked at the Walsh/Doyle allegations on instability,
19 it didn't appear that that was what Walsh and Doyle
20 were talking about in their case of instability.

21 The way I understand their definition of
22 instability it really..well, it seems to have come
23 about from modeling of using the STRUDL program. And
24 I believe Mr. Walsh defines stability, in one sense,
25 as equivalent to pushing a chain. And Mr. Doyle has

CS

NRC T5

11

1 always explained it in terms of three bi-linkages.
2 But, when one thinks in terms of the STRUDL modeling,
3 I believe Mr. Doyle made some reference to when they
4 modeled some these supports in STRUDL, they ended up
5 with very large rotations and displacement. In other
6 words, it really could not be well modeled into STRUDL.

7 Now, I'm not saying that that means the
8 support is necessarily unstable, but, it does point
9 out either that there is a modeling problem, or that
10 something is not correct with that support. That it
11 cannot be properly modeled using STRUDL analysis.

12 So, with INSIGNA, has also defined instability
13 in terms of buckling and also in the sense of plastic
14 hinge, in another words, the total collapse of a system.
15 And I still don' t believe that that is what Walsh and
16 Doyle were talking about.

17 Maybe at this point I should ask you for
18 a clarification of your definition of instability,
19 and then I could probably put in what I think is, what
20 we mean by instability, then we could proceed from there.

21 MR. FINNERAN: Well, I think that, I think
22 I would have, as far as a definition of instability,
23 I would have to agree with what Dr. Bjorkman said in
24 the hearings, that there are different kinds of instability
25 and he characterized it, I believe, pretty much along

CS
NRC T5
12

1 the lines of structural instability, and I think that
2 that is the collapse of a column. And, lets say, in
3 compression, when you exceed the collapse load of the
4 column. And rigid body instability. Which would be
5 akin to the pushing the chain or Mr. Doyle's three
6 bar linkages. That type of instability would be where
7 the support may not be able to take any load at all.

8 I think Walsh and Doyle, and maybe it's
9 easier to...my impression of what they're talking about
10 when they say instability, are the supports that we've
11 addressed here, the box frame on a single strut, where
12 the question of whether the box frame will rotate
13 around the pipe, and thus you have the three bar linkage
14 he's talking about. The two pins of the strut and then
15 let's say a third pin that represents the cability of
16 the box frames that rotate around the pipe.

17 That, if that support weren't perfectly
18 aligned, and if there weren't some mechanism to pre-
19 clude the rotation of the frame, around the pipe, then
20 that's a rigid body type of instability. That support
21 potentially can carry no load in compression. The
22 same thing with a strut, a backing plate, and let's say,
23 a u bolt with a gap, i.e. the mainsteam support that
24 Mr. Doyle had in his deposition. The same type of
25 phenomenon, rigid body type of instability. Then I

CS
NRC T5
13

1 think the other type of instability that Walsh and
2 Doyle were talking about, related to what you said
3 about the STRUDL modeling, is that, actually, you could
4 take a strut and a clamp, and model that thing in the
5 STRUDL, and it's going to be unstable as far as
6 STRUDL is concerned, because it's looking at the load
7 that you're applying on it, it's just an externally
8 applied load. From some source.

9 And it's not taking into account the re-
10 straining effect of the pipe. The support is actually
11 attached to a pipe, that will not allow the support
12 to swing out of plane, and become unstable, as STRUDL..
13 there's nothing in STRUDL to model that restraining
14 effect of the pipe.

15 So, I think that's the instability as you
16 had related to STRUDL modeling. That they're talking
17 about. I really think that the real stability issue
18 that they were concerned with is the rigid body type
19 of the three pin or the three bar linkage, as they call
20 it, related to the single strut or snigger (ph) supports,
21 and the piping plate and the u bolt that had a thermal
22 cap, and the same thing, single strut snigger support
23 that had a box frame around the pipe.

24 MR. TERAQ: Going back to the STRUDL modeling,
25 when you said that the model in a strut with a clamped into

1 STRUDL, that would also appear to be unstable for the
2 STRUDL, unless you could some how account for the piping
3 modeled in there with the stiffness.

4 But, with these supports that were considered
5 to have potential instability, what you're saying, then,
6 is that if that support were allowed to rotate around
7 the pipe, in other words, if it has no clamping action,
8 then that is what you defined to be rigid body instability?
9 Okay, I could agree to that definition. In fact, when
10 I look at the different so-called classical definition
11 of a stability, there is the, if you look at a ball,
12 on certain elevations, if you have a ball in a valley,
13 so to speak, that's a stable situation. If you have
14 a ball on a peak, that's an unstable situation, and if
15 you have a ball on a plateau, that's a neutral stability.

16 All right, now, when you refer to a rotation
17 of the clamp around the pipe, I agree that it's not
18 unstable from, in other words, it's not equivalent to
19 the ball on the peak, but it is equivalent to a ball
20 on a plateau. Hope this makes any sense. In other words,
21 it's not really unstable, but, on the other hand, it's
22 not stable, either.

23 MR. FINNERAN: Its not carrying loads.
24 It dosen't carry loads.

25 MR. TERAQ: So, the concern, and this is why

1 I would agree with you, the concern is where you
2 could have a support or a clamp around the pipe, that
3 it's not performing a clamping function, and therefore,
4 the clamp can move or rotate to an undesirable position
5 or to an unanalyzed position.

6 MR. FINNERAN: Okay.

7 MR. TERAQ: Now, that is the way that I'm
8 going to be defining instability, in the sense that
9 instability is the potential for support to shift to
10 an undesirable position, which has not been analyzed.

11 Now, that doesn't mean that it's necessarily
12 a safety concern, and it doesn't necessarily mean that
13 it's unstable in a classical sense. But, it only
14 means that it is not controlled.

15 In other words, it would be equivalent
16 to a clamp that has loose bolts, and in that sense,
17 we would not accept the clamp with loose bolts, or
18 you wouldn't accept a clamp that doesn't completely
19 clamp around the pipe, and that could slide along the
20 pipe. Okay.

21 So, if we can agree to that definition
22 of instability, then I think that we can proceed with
23 something else.

24 MR. FINNERAN: I would say one thing. Our
25 primary concern is to address the allegations of

1 Mr. Walsh and Mr. Doyle in this area, and I also,
2 I thought that we were trying to address some of
3 this confusion about stability and the different
4 kinds. In fact, Chairman Block specifically asked
5 that we do that.

6 If you look at the Doyle allegations on,
7 back in his deposition, on stability, the only real
8 issue on stability, that he is addressing, is the
9 rigid body mode. If you go back and look at, I think
10 it's Section 4, of his attachments, where he's given
11 examples of the stability issue that he's talking about.

12 And he's talking about the three bar linkage
13 in all cases, either with box frames or ..

14 MR. IOTTI: With one exception. He kept
15 bringing up, which is purely imaginary, that of the
16 u bolt, with no pipe through it, where, if you let it
17 go, it will fall. He kept bringing it up and we kept
18 asking, you know, what's the purpose of that support
19 if there is nothing to support? But, that one he
20 kept bringing up, so I'm just pointing out that that
21 was also his idea of instability.

22 MR. TERAQ: But, I think, my problem with
23 trying to address this particular summary of his position,
24 was trying to decide if we are going to be addressing
25 stability strictly from the Walsh, the way Walsh and Doyle

1 have tried to characterize it, or perhaps the way other
2 people have tried to characterize it, or whether or not
3 there is any question and a potential safety concern
4 from, not necessarily the allegations themselves, but
5 from the design that was being addressed through the
6 allegation.

7 In the sense that, Walsh and Doyle may not
8 have clearly established on the record, exactly what
9 their concern is with instability, but they may have
10 had a valid concern with the design, itself, and whether
11 or not that design can be considered acceptable.

12 And that is the way that I would like to
13 at least, address this issue from a staff standpoint.

14 MR. IOTTI: We're not entirely sure what
15 you're saying, David, but, the affidavit addresses
16 two parts. The front part is really intended for
17 Judge Block. He specifically requested applicants
18 to provide a definition of the various types of stability.
19 Whether in fact, all of them would be addressed or not,
20 as to the latter part of the affidavit, specifically
21 addresses the stability issues raised by Case.

22 So, from the standpoint of Case, we're
23 addressing the stability issues that they have raised.
24 And Judge Block wants an education on stability. And
25 then, of course, we have to comply. But, a lot of

1 this information is provided in direct reply to his
2 questions, that were raised on, both on that telecon
3 and also on these subsequent memo and order. So,
4 we couldn't very well ignore those. I always agree
5 with what you're saying, either...

6 MR. TERAQ: But, I also recognize what the
7 Board is asking the staff to look at it, too. So,
8 with that, maybe we should get into the affidavit, itself.
9 I think comment, and answer a few questions on the
10 affidavit, itself.

11 On page 7, of your affidavit, the question
12 was what is standard industry practice regarding con-
13 sideration of stability of piping systems, and one
14 part of your answer states that it's not necessary,
15 apparently, to consider stability, because during the
16 normal design process, the piping designers achieve
17 a system which will stay within specified deflection,
18 and thus, will be incapable of a type of instability
19 illustrated in figure 1C.

20 I guess I take exception to that statement.
21 The deflection limits, themselves, do not necessarily
22 assure piping system stability. First of all, deflection
23 limits are intended for the pipe supports, to keep
24 the supported component within, it's intended to assure
25 the operability and functionality of the supported

1 component. I'm not sure how you concluded that the
2 deflection limit can assure stability of the piping
3 system. So, perhaps you might want to address that
4 a little bit more.

5 MR. FINNERAN: Well, the only thing that
6 is meant by this particular statement is, that we
7 talked about earlier, the fact that when you have a
8 support, such as is shown, in figure 1C, say of a
9 strut with a clamp, but that support, in and of itself,
10 isn't unstable support, in and of itself. But, you
11 attach with a snort (ph) clamp, to a piping system
12 in which there is another support, in the other direction
13 down stream, that can prevent the side sway that would
14 make it an unstable support..

15 MR. IOTTI: Yeah, but the answer stands
16 as it is. Everywhere in the piping system, within
17 prescribe deflection limits, and if you can assure
18 function ability by the system, by your definition,
19 you're not unstable. You cannot be. Now, implicit
20 in that is that the designer has recognized that the
21 support behaves as he has modeled it. That's where
22 the question of instability may creep in. But, if
23 you, in fact, have modeled it properly, and if the
24 piping system, and, of course, the support system is
25 everywhere within the specified deflection limit, how

1 can it be unstable?

2 MR. TERAQ: Well, that's very simple. If
3 you had a system with a long riser, a tall riser, and
4 if you only supported it from the bottom, and the riser
5 is not considered stable, unless, of course, as John
6 has pointed out, added supports, horizontal supports
7 at the top.

8 MR. IOTTI: But, if it weren't stable, you
9 would calculate that it deflected out past the prescribed
10 deflection limits. If you stay within the prescribed
11 deflection limits, either the analysis has computed
12 that it can stay within the deflection limits without
13 the additional supports, or he will add the supports.

14 MR. TERAQ: No, it's unstable from, in a
15 horizontal sense. If it moves sideways.

16 MR. IOTTI: But, then he would violate the
17 limit sideways.

18 MR. TERAQ: But it's not shown in the analysis.

19 MR. IOTTI: How do you know that? The
20 deflection is shown in all directions of the analysis,
21 and the limits are prescribed in all directions. I
22 think that we're getting hung up on semantics. Where
23 the problem might arise, is, if in fact, it's mismodeled,
24 and the applicant, the analysis has believed he's modeled
25 it correctly, but, in reality the system behaves differently

1 than it has been modeled. For instance, a typical
2 example is these box supports. When the analysis
3 models it as if the support were not rotating, he
4 in fact, believes that that support will keep that
5 point of the pipe fixed in space, or within a small
6 deflection. In reality, the support by rotating around
7 the pipe, permits the displacement to be much higher
8 than what the analysis believes it to be.

9 So, what the model would show you, the
10 analytical model will show you is that you have a
11 stable system, but the real model may show instability
12 at that point, in that sense.

13 MR. TERAQ: Well, I guess what I'm referring
14 to is some of the fundamental rules of hanging a piping
15 system. In that sense, I'm not saying it's unstable,
16 but, I'm saying that you may not have a totally stable
17 system if you support a riser, only from the bottom.
18 I agree it's common sense...

19 MR. IOTTI: Not many people would do so.
20 On the other hand, there maybe instances where you
21 want to do that, in which case you would do a very
22 accurate analysis to make sure that if you only support
23 it at the bottom, you don't have a bucking problem, nor
24 do you have a matter of displacement problems.

25 MR. TERAQ: But, that is the type of system

1 stability that was referred to in the SIT report,
2 that should be reviewed by piping designers.

3 MR. IOTTI: And it is, it is.

4 MR. TERAQ: Which brings me to the next
5 comment. I believe, on page 7..

6 MR. IOTTI: Well, I guess, before we go
7 there, on this page 7, you said that the stability
8 of piping is not explicitly, but that doesn't mean
9 that implicit is not addressed. That, you know, one
10 doesn't explicitly go through, and on a piece of paper
11 say, you know, this portion of the piping system is
12 stable and that portion of the piping system is stable,
13 but the piping analysis, when he performs all of his
14 analysis, that's very far that this piping system is
15 stable, that everywhere deflections are within what
16 he wants to have. So, implicitly he does the stability
17 review.

18 MR. TERAQ: Yes, I will agree that the piping
19 system can only be evaluated for stability by looking
20 at the configuration and the locations of the supports.
21 But, you have to look at the system as a whole to de-
22 termine the piping system stability. But, I don't think
23 that is really what the issue is, here, with the unstable
24 supports. I don't believe that was what the issue was.

25 I agree that is what the SIT addressed, and I

1 agree that when you look at it from that perspective,
2 that there is no problem, and there shouldn't be any
3 guidelines, because that is common sense ...

4 MR. FINNERAN: Judge Block asked us to
5 address all the stability issues that have been talked
6 about, and this was one of them. I think he had a little
7 point of confusion in his mind, about this system stability
8 thing, and relating it to the (inaudible) so we tried
9 to put it in perspective.

10 MR. IOTTI: We actually restated, if you will
11 read the question, here. It says, what is the standard
12 and practice regarding consideration of (inaudible)
13 piping systems, and maybe we should have, as a whole,
14 maybe we should have added that. So, that answer strictly
15 pertains to the piping system as a whole, not to stability
16 of supports, in itself. And, it was again, for the
17 purpose that John just stated, to clarify whatever mis-
18 conception or lingering doubts that Mr. Block may have
19 had.

20 MR. TERAQ: It's just that maybe the last
21 statement, you say in summary, the piping analysis assures
22 stability of the piping system by limiting deflection,
23 which negates any need to assist stability separately,
24 and I took issue to that.

25 MR. IOTTI: I see. The wording is ..okay.

1 MR. TERAQ: I'm saying that he should look
2 at the configuration, and not only rely on his analysis.

3 MR. BURWELL: Could we go off the record
4 just a moment?

5 (Off the Record)

6 MR. BURWELL: Back on the record. Mr. Finneran
7 was called to the phone so we went off the record and
8 took a brief recess.

9 There was some discussion during that period,
10 and I guess, would one of you gentlemen restate the
11 gist of that, please?

12 MR. IOTTI: I don't know whether David or
13 myself, should restate it. My understanding is that
14 the contention, here, is on the last sentence of the
15 answer that appears on page 7, of the affidavit, where
16 we state that in summary, the piping analysis assures
17 the stability of the piping system by limited deflection,
18 which negates any need to assess stability separately.

19 That could be misconstrued to mean that the
20 piping analysis only looks at deflection. That is not
21 the case. He also looks at configuration. But, typically,
22 it's the combination of assuring that a configuration
23 is proper and the deflection limits are self imposed
24 by the analyst themselves, are met everywhere. And
25 if the modeling and the actual system are one and the

1 same, that that insures that the system, as a whole,
2 is stable.

3 MR. BURWELL: Before you go on, I want to
4 clarify that some point. When you say, he looks at
5 the configuration, are you talking about him looking
6 at the configuration of the pipe, plus all of the
7 support from one anchor point to the next anchor point,
8 or stated another way, I think, at the pipe stress problem
9 in it's total, or are you speaking of configuration as
10 being related to only one support, and it's a piping
11 for (inaudible)

12 MR. IOTTI: You would look at the overall
13 configuration, probably from anchor point to anchor point..

14 MR. BURWELL: The configuration that he is
15 studying for stability, is it overall system stability
16 and not necessarily the stability of the, of each in-
17 dividual support.

18 MR. IOTTI: That, and I refer, that is the
19 piping analysis that does so. Okay? The support designer
20 is something else. The support designer has to provide
21 a support which fulfills the function which the piping
22 analyst has asked that support to fulfill.

23 MR. BURWELL: But, then, is the piping stress
24 analysis reviewing and reaffirming that each support
25 does perform the function that he needs to assure the

1 accuracy of the stress analysis?

2 MR. FINNERAN: I think we stated in the affidavit
3 that that is not the piping analysts job. That it is
4 the support designer's job. Provide a support that will
5 provide the function that the piping analyst wants,
6 at that point. And that's what we say in the affidavit.

7 I think, personally, I still think what
8 we've stated here is correct. That the analyst
9 looks at figuring the supports for the stress problem.
10 He knows that he wants to get enough supports on there
11 in all directions, that it will be stable, and if
12 he puts that thing in the computer program, and he
13 controls the deflection, he will have assessed the
14 system's stability.

15 He wouldn't be able to invert his stiffness
16 matrix in the piping analysis program if it wasn't
17 stable. And just what we say right there, if he has
18 not provided the proper multi directional support re-
19 quired by the patten configuration, he won't be able
20 to run the computer program.

21 MR. FLECK: That's true when you mean
22 computer program.

23 MR. FINNERAN: That's true. This be a
24 addle (ph) pipe or..I'm talking about piping analysis,
25 super pipe, or new pipe..all of those, I believe, I'm

1 I believe they all involve the production of stiffness
2 matrix for the piping system, and if he has a direction
3 for the piping that's not supported in a particular
4 direction, there, he'll get a zero term on the diagonal
5 lease, and on his stiffness matrix, and it will blow out.

6 MR. TERA0: Well, I take exception to the
7 fact that you're saying that the deflection of the
8 supports that assure the stability of the piping system?

9 MR. FINNERAN: No, I'm not saying that's
10 a question on supports.

11 MR. IOTTI: He's talking about total deflection
12 of piping systems. That's what I tried to clarify.

13 MR. FINNERAN: I don't think we said..we're
14 not talking about the deflection of the supports. This
15 is a specified deflection limits for the pipe.

16 And all points along the pipe.

17 MR. FLECK: Yeah, I think that's where I,
18 that's why I asked that question.

19 MR. FINNERAN: No, this is not the deflection
20 of the supports.

21 MR. FLECK: We're talking STRUDL and then
22 we're backing to piping.

23 MR. IOTTI: This entire question relates
24 to piping, but not to the support itself.

25 MR. TERA0: Okay. In that sense, I don't

1 object to your statement as strongly, but I do, but
2 I still do object if you are saying that the piping
3 designer does not look at his system or stability,
4 and only looks at the analytical results which may
5 show movement of the pipe. Just from a very basic
6 engineering principle, going back to my riser supporter
7 from the bottom, that may show up to be quite stable
8 in the weight analysis, and may show up to be quite
9 stable in the thermal analysis, but your thermal
10 analysis can tip the riser over, so you can't have
11 an unstable system. It's not accounted for when you
12 combine the two.

13 MR. FINNERAN: You don't think that controlling
14 the deflection limits on that riser would dilute that?

15 MR. TERAQ: No, no. The deflection limits
16 will not account for ..

17 MR. FINNERAN: I'm talking about in all di-
18 rections. The deflection limits in all directions.

19 MR. TERAQ: What I'm saying is, your deflection
20 limits does not assure that the off set due to the
21 thermal extension of the pipe will not affect the
22 stability from the weight analysis. The weight analysis
23 does not, does not have the deflections of the pipe
24 as shown in the thermal analysis.

25 MR. IOTTI: What John started, and never quite

1 finished is that, when he considers the configuration,
2 what you said he should do in a good engineering sense,
3 that's the time when the analyst choses where he
4 wants the supports placed. It's at that time which,
5 where he implicitly he considers the stability issues.

6 In other words, if he sees a long riser,
7 he will place intermediate support in that riser, so
8 that he doesn't have the problems that you're referring
9 to. But, that's not when he's finished, because those
10 support may not be adequate to meet certain deflection
11 criteria that he has imposed. So, he performs then,
12 the analysis, and the combination of having done the
13 implicit consideration of the stability question of
14 the overall system, from anchor to anchor. Plus the
15 fact that he now has an answer that says I meet my
16 deflection criteria everywhere, is what gives him the
17 assurance that he has a stable piping system.

18 The configuration analysis, if you so will,
19 is done at the time when the analyst has an unsupported
20 backing system, and he has to contend with how to support
21 it. That's where the implicit goes through those
22 considerations. He's the one that select the location
23 of the support.

24 MR. TERAQ: That maybe true, and it maybe
25 true that the original person who selected the original

1 location, did take that into account. But, as you know,
2 as you go into the field, and you may not be able to
3 add a support at the top of the riser, you may not,
4 may be only to put it at the bottom of the riser, and
5 supports get shifted around and skewed and so, someone
6 has to look at support configurations at the end to
7 assure that the system is still stable.

8 MR. IOTTI: It's either the same analyst
9 or that information back from the field is relayed
10 back to the analyst that says, is it still okay
11 from the piping system standpoint. I'm talking now,
12 both in terms of global stability, global stability
13 being the stability of a piping system. Not local
14 stability of a particular support. That information
15 is relayed back to the analyst or some other analyst,
16 which then has to review it and still accept it.

17 So, it's again looked at.

18 MR. TERAQ: I think that goes back to the
19 Spot's question about who is responsible for that?
20 Who..

21 MR. IOTTI: The piping analyst only wants
22 to know whether that support is being moved from here
23 to there, and whether that support still satisfies the
24 function for which he originally, that he originally
25 specified that support should accomplish. In other words,

1 if you said I need an axel restraint, here, he wants
2 that support wherever it's being moved to, to be again
3 an axel restrain, or he has to go back to the support
4 engineers and say, now, okay, change the support type.
5 I want something different, now. It is the support
6 designer responsibility to make sure that the support,
7 wherever he designed it, fulfills the function that
8 the piping analysist calls for.

9 MR. TERAQ: I'm still only talking about
10 the piping system stability.

11 MR. FLECK: I think that's what he's elaborating.
12 If you have a run riser and no support, therm at loose
13 there, the weights there, could you ever have that?

14 MR. FINNERAN: Well, the analysist would see
15 that in his deflection analysis.

16 MR. FLECK: Which deflection analysis?

17 MR. IOTTI: No, he wouldn't see that, because
18 you don't combine thermal and with that weight in that
19 fashion. He says, if this thing is tall enough or long
20 enough, weight alone, under a different deflection,
21 could cause a buckling problem, if you don't have support
22 someplace. Or at the proper..

23 MR. FLECK: Now you have a huge moment from
24 that, say, it's an 18inch riser, and it rotates one half
25 a degree, you're going to have a big moment due to dead

1 weight, would the piping analysis person normally
2 have put in a side support there or not? It's a
3 pipe problem, not a support problem.

4 DR. CHEN: Is it true, John, that, if that
5 is stress problems, that as (inaudible) they get an
6 estimate that would show what the analyst gets
7 an estimate that would show is the runner piping
8 from anchor to anchor, and together with that he gets
9 a drawing of all the supports. And the drawings re-
10 flect the thermal movements are specified. Only at
11 support points. If you don't have a support there,
12 there's no displacement specified. The pipe is not
13 going to give displacements to the length of the pipe.

14 MR. IOTTI: Oh, sure it can. Sure it can.
15 At every point that we want to.

16 MR. FLECK: But, would he transmit that
17 to the support people? Only places..

18 MR. IOTTI: He would only transmit to the
19 support people what the support people are interested
20 in.

21 MR. FLECK: So, if the piper forgot to put
22 a snubber on a high riser, the pipe is the person, the
23 piper would be the one that has created the problem,
24 not the support people.

25 MR. IOTTI: But, on the other hand, if he

1 has forgotten, and if that dosen't hurt him, then you
2 don't need it. If it does need it, the piping analysis
3 will tell him, hey, you need something here.

4 MR. FLECK: If he had did a seismic analysis
5 and found out he's got a, or a thermal..what Dave
6 is saying, the thermal he could do. There's no problem.
7 But, now the pipe is displaced, due to this large riser,
8 displaced a foot, say, horizontally. Now, you have
9 a moment due to that weight, that's never included in
10 the weight. I can't forsee that happening if he did
11 a seismic because he would have to put a snubber up
12 there, or he would never be able to take what's equivalent
13 to a side load of .2 or .3 Gs, depending on your..

14 MR. TERA0: But, the snubber can bottom out,
15 that's the point. Come late and come thermal.

16 MR. FLECK: Well, not from weight. From
17 thermal it could, because the snubber would have to
18 be horizontal.

19 MR. IOTTI: Well, let's be factual. Are
20 we imagining a problem? I have never been in too many
21 plants where you see this long risers without any
22 actual supports along. You know, supporting the weight,
23 intermediate. Okay?

24 MR. TERA0: If he'd done his job right,
25 he'd have to take a snubber and put it in there.

1 MR. IOTTI: Well, not always. Sometimes,
2 yeah, you put a snubber, of course, and typically, you
3 would design your support in such a way, even if you
4 have a very large thermal expansion, you design it
5 so that at the end of the thermal expansion..

6 MR. TERAQ: Or he might just have a regular
7 strut there..but, I think that's what Dave is, has
8 a question about. Yes, that's basically, what I disagreed
9 with, was your conclusion. Because when I read that,
10 it seems to go against the grain of some of the basics
11 of just piping design. That you are relying only on
12 deflection, as shown in your analysis, to assure the
13 stability of the system. That is what I'm disagreeing
14 with.

15 MR. IOTTI: And what I tried to clarify
16 is it is not just deflection. It's also configuration.
17 That the typical analyst looks at the configuration.
18 Where I have difficulty now, how does he look at it
19 explicitly, he does not. I mean, he looks at it.
20 But, then, you really rely on an individual's judgement
21 and his experience that says this configuration may
22 lead me to a problem and I need support here and here
23 and there.

24 MR. TERAQ: I see this contradiction, here.
25 On the one hand, you're saying, yes they do, and on the

1 other hand, John is saying, no, they don't have to.
2 I guess, in that sense, I'm a little disturbed because
3 I don't know, if you were to say, of course they do,
4 this is common sense engineering, everyone does that.
5 But,...

6 MR. IOTTI: I don't think that's what John
7 is saying. They do do it, and I don't think John is
8 saying that they are not doing it. You're saying that
9 he's now, are you telling me that they don't have to
10 do it?

11 MR. FINNERAN: No, that's not what I'm saying.

12 MR. IOTTI: I didn't think that's what he's
13 saying. That's..

14 MR. TERAQ: And that's why I'm taking exception
15 to this last statement, which negates any need to
16 assess stability separately, that that is what I'm
17 taking exception to. If you want to change that
18 statement, you may.

1 MR. IOTTI: We will have to, well, if you take
2 that sentence in conjunction with the prior sentence, in
3 addition, if the total support scheme does not provide
4 the proper multi-direction of support required by the
5 composite configuration, the way I read that, that says
6 implicitly the piping analyst does look at the
7 configuration. Cause, he's the one that selects where
8 he wants to support, he's the one that selects what kind
9 of support and what type of function the support has to
10 exercise. And then, as he goes through his analyses and
11 then confirms it, all his deflections is where he wants
12 them to be, then he has the stability of the system that
13 he desires. Whether we used the improper wording there
14 at the end, I guess I'll have to talk to John and see
15 how we might change it.

16 MR. TERAQ: Maybe I just wanted to clarify where
17 I disagree. Perhaps, I'm reading into this a little too
18 deep then what you're trying to say, but, but,

19 MR. IOTTI: Well, I think you're reading it a
20 lot more strictly than we usually do.

21 MR. FINNERAN: I was really trying to say what I
22 said before in relation to 1C. We're talking about this
23 type of stability where other supports that are unstable
24 by themselves because they're figured in a system with
25 neighboring supports in a certain direction that

1 controlling these deflections of the piping system will
2 make the system stable. In that limited sense, this is
3 really what this is saying.

4 MR. IOTTI: Well, look, we can go back and
5 actually go back to the beginning as to how the normal
6 pipe analyst does the normal. Everyone that I've ever
7 known, regardless of whether they're are in a
8 (inaudible) with Gibbson Hill and Stolen Webster or
9 Bechtel does despite economists. Normally the mechanical
10 people...

11 MR. FINNERAN: I think he agrees with that. He's
12 just taking issue with this statement which was made in
13 the narrow context of this in this Figure 1C.

14 MR. TERAQ: Right. Maybe I'm looking at it not
15 even from the sense of Walsh Doyle allegation but from a
16 sense of piping engineering. I'm looking at it from a
17 broad sense not only from what the allegation is saying.
18 Because I want to clarify that. Because I don't think
19 the allegations are really specifically aimed at system
20 instability, they're aimed at pipe support instability.

21 MR. IOTTI: But, Mr. Bloch asked for us to also
22 explain what system instability was because Dr. Chen
23 brought it up here in the Hearing and I think Bloch got
24 totally confused by all of these stability questions
25 raised right and left.

1 MR. TERAQ: Well, I don't blame him to tell you
2 the truth.

3 MR. IOTTI: Actually, this year was pretty black
4 and white, to be honest with you. I don't really under-
5 stand why we were getting so confused on this.

6 MR. WADE: I think the whole issue came down to
7 Walsh Doyle wanting us to consider each individual pipe
8 support, without the piping. And our whole contention
9 was, you must consider the piping there as a system with
10 a standard way of doing analysis, that guarantees that
11 the system is stable. The individual support by itself
12 doesn't matter.

13 MR. IOTTI: Yes it does. Okay. That's the
14 whole issue that I'm again raising. Because the support
15 must perform the function that the piping analyst called
16 for.

17 MR. WADE: But their contention was, it's was a
18 3-pin connection.

19 MR. FINNERAN: Aw, that's ridiculous, isn't it?

20 MR. WADE: That's where they started this whole
21 thing. Support must perform the function that the
22 buying analyst has called for.

23 MR. FINNERAN: If you've got no pipe there, you
24 don't need the support to start with.

25 MR. WADE: Our whole contention and all we've

1 said, I think, is that when you take that whole system
2 properly analysed, it's a stable system regardless of
3 this 3-pin connection business.

4 MR. TERAQ: Yes, and maybe I should continue
5 with that train of thought because with the example that
6 you gave us, 1C, 1A, D, and C, I would agree with what
7 you saying there 100%.

8 MR. FINNERAN: Well, that's really the narrow
9 context of my statement at the bottom of page 7.

10 MR. TERAQ: Okay. I'd better continue. I would
11 agree with what you're saying here with regards to
12 system stability, provided that the support is
13 performing its function, as Dr. Iotti has said, and
14 providing that the clamp is performing its function too.
15 But if the clamp can rotate then I don't agree that you
16 have a system instability but you have a support
17 instability, which again is deficiency but not
18 necessarily a safety concern. And, I think that is the
19 area that I would like to focus in on. Not piping
20 system stability but on this particular, on a particular
21 support potential instability.

22 MR. IOTTI: Fine.

23 MR. TERAQ: As long as we're on the same wave
24 length I don't think we'll have a problem.

25 MR. IOTTI: We are.

1 MR. TERAQ: Okay. So let's take the first type
2 of support. Apparently, you discussed four different
3 types of unstable, potentially unstable supports, and
4 provided either reasons why they are not potentially
5 unstable any more, and the reasons for them becoming
6 potentially unstable.

7 The first type of support is the box frame with
8 single struc or snubbers. The modifications are shown
9 on page 13 where it is saying that you may either use an
10 index lug, or additional struc, or a cinched up U- bolt.

11 First of all, is this type of support, this type
12 1 type of support, including those box frames with and
13 without thermal gap, between the pipe and the support?

14 MR. FINNERAN: Okay. First John will have to
15 illuminate on that a little bit.

16 MR. TERAQ: Are these box frames with single
17 strucs or snubbers? Do they have zero gap and a gap, if
18 there is one?

19 MR. FINNERAN: These supports generally, I
20 believe, would have zero clearance between the pipe and
21 the box frames.

22 MR. TERAQ: Did you ever any of these with a
23 gap? When you say that there is 12 supports of this
24 kind I wasn't sure whether you're saying that that
25 included the gap, or did not include a gap.

1 MR. FINNERAN: Well, these box frames with
2 single structure snubbers were all the result of
3 modifications made by the field engineers. It's
4 possible that some point in time that they may have put
5 a box frame around the pipe if it had a clearance but at
6 some point, all these box frames were made with zero
7 clearance between the pipe and the boxes.

8 MR. TERAQ: I think that was my first question,
9 whether or not there existed any, whether there still
10 exists any of the box springs with a gap. I believe in
11 your Attachment, it doesn't have a number, sheet 101,
12 Request for Information, Comanche Peak Site, where it
13 showed a single str. c with a box frame and it looks like
14 it had a gap around it. I wasn't sure.

15 MR. FINNERAN: I think that's just the drafting of
16 that particular time, or the sketching of it.

17 MR. TERAQ: So, you're saying that there are
18 none with gaps that would exist, at this time?

19 MR. FINNERAN: No. Not without some of these
20 modifications. I think more important than whether
21 there's any with gap left, is that there are none left
22 without and specifications made, regardless of whether
23 they had a gap or not.

24 MR. IOTTI: All of these box frames and single
25 strucs have been modified.

1 MR. TERAQ: Right. But when you said there were
2 12 supports of this kind, and what your discussion is
3 focusing around zero clearance box frame and the pipe.
4 You say there's 12 supports of this kind. I wasn't sure
5 if that excluded frames with a gap or whether it was
6 implicit that there does not exist any frames with a
7 clearance. And that's what I'm trying to clear up.

8 MR. FINNERAN: I don't think any of these had a
9 clearance, or have a clearance on them now.

10 MR. IOTTI: Is the total number of box springs,
11 with or without clearance, whether they might of had
12 one, or whether it was intended or not. Is it 12? Is
13 that the total? Is that the total sample? Box frames?

14 MR. FINNERAN: That's the total box frames that
15 have single structures. That's it. That's the
16 total.

17 MR. BURWELL: Let me just get our tenses
18 straight. There were 12, now there are zero. Thank
19 you.

20 MR. IOTTI: Now there are zero. Now there are
21 bona fide box frames.

22 MR. FINNERAN: There might still might be a box
23 frame on a single struc or snubber but it will have some
24 other modifications.

25 MR. IOTTI: That's what I say. Whatever there

1 are now, they're modified.

2 MR. FLECK: So none of them can rotate, whatever
3 their modifications.

4 MR. TERAQ: So, now the question whether or not
5 we will accept the modifications.

6 MR. CHEN: Let me just ask one question. In
7 addition to the 12 are there any other single strucs
8 that have, other than zero clearance, that have not been
9 modified?

10 MR. IOTTI: There are only 12.

11 MR. TERAQ: Okay. With respect to the index
12 lugs, at this time, I can't accept the index lugs. This
13 might be easier explained with the frame design, your
14 Type 3.

15 Okay, let me explain what my problem is with
16 the index lugs. As you pointed out earlier, concern
17 with the support instability was the ability for the
18 strength to rotate around the pipe. What would prevent
19 the frame from sliding along the length of the pipe?

20 MR. FINNERAN: You talking specifically about
21 index lugs?

22 MR. TERAQ: Yes.

23 MR. FINNERAN: If you want to address index
24 lugs, or even additional struc, you both, I know you're
25 going to say, it's a cinch, Donald, but the first two

1 modifications, can slide along the length of the pipe.

2 MR. TERAQ: I don't think so.

3 MR. IOTTI: I have an answer to that one,
4 actually. As it turned out, from a test data, it
5 indicated that unless you were also able to rotate about
6 the pipe the tendency, during a seismic oxidation, was
7 to pull back to align yourself further, as opposed to go
8 out, and that happened in all instances. And you can
9 actually rationalize why that is so. It's just a
10 mechanical advantage that forces you to go to the region
11 of least resistance. So, if it slides, it slides in a
12 favorable manner. But the key there is you must prevent
13 rotation, because the moment you present rotation you
14 can actually gain an unfavorable mechanical advantage
15 that makes the least resistance position away from you.

16 MR. FLECK: Are the lugs welded long enough on
17 the pipe that the rotation is guaranteed?

18 MR. IOTTI: That I don't know. I don't know the
19 details but I presume that the index lug would be such
20 that the frame cannot rotate about.

21 MR. TERAQ: Maybe I didn't quite catch what your
22 argument was.

23 MR. IOTTI: Well, as it turns out, if you have
24 let's say something that's misaligned, and you now have
25 seismic exertation, unless the frame can rotate

1 about the pipe, what the seismic then will do will pull
2 you back in a better aligned position, where you lose
3 if anything, or are lined better with your pipes.

4 MR. TERAQ: Thank you.

5 MR. IOTTI: You'll see that in the U bolt, also.
6 And that happened every time and you can actually sit
7 down with a piece of paper and prove to yourself that
8 must be the case. The moment this frame can begin to
9 rotate you can actually go to a lever arm, which is more
10 favorable, that pushes the frame away from you, in which
11 case the frame will slide along the pipe and, if you
12 want to call it, in an unstable manner, you would do so.

13 MR. TERAQ: Wasn't that testing done by exciting
14 the support itself?

15 MR. IOTTI: No. Through the struc, the very
16 bottom.

17 MR. TERAQ: Well, that's what I mean. Exciting
18 the support itself. In other words, the exertation was
19 coming from the support, right? But, I guess my problem
20 would be,

21 MR. IOTTI: But that's where the exertation
22 comes from. It's a seismic event. Oh yes. Exertation
23 comes through support, not from the pipe.

24 MR. TERAQ: All right. There's two sources of
25 exertation. One is,

1 MR. IOTTI: The pipe reacts to the exertation.
2 If you have some sloff, you will have some back from
3 the pipe, I agree.

4 MR. TERA0: I think what we have to talk about a
5 little is the physical behavior of a plant during a
6 seismic event. You have two basic movements acting on
7 your pipe. One is the relative displacement, relative
8 excitation of coming in through the support from the
9 wall of the building. It's the relative movement
10 between the building and the pipe.

11 But, you have another excitation, due to the
12 building moving itself. This is your global movement of
13 the building. And these can be quite large, in the
14 order, maybe a dimension peak of 3 inches, which is
15 small but in other plants it could be quite a few inches
16 larger. If the plant is moving, globally several
17 inches, back and forth,

18 MR. IOTTI: So, it's got support, moving
19 globally, several inches, back and forth.

20 MR. TERA0: But not along the length of the
21 pipe.

22 MR. IOTTI: What happens if the support moves
23 with the floor or the wall?

24 MR. TERA0: No, it's the inertia movement of the
25 support along the length of the pipe. The building

1 shakes, the pipe and the box frame around the pipe is
2 moving together with the building, and when the building
3 backs up, the pipe backs up with it because of all the
4 support on it. The frame keeps on moving in that
5 direction.

6 MR. IOTTI: I understand. You don't have to say
7 nothing further. Now we're talking about the inertia of
8 the frame relative to the building, inertia that pipe,
9 and it's likely to be much less, the frame itself.

10 MR. TERAQ: Well, I agree that the inertial vote
11 is very small but it's enough to move it along the
12 length of the pipe, unless you have a positive clamping.

13 MR. IOTTI: What I was actually thinking was the
14 opposite because it's very small and it reacts very
15 quickly, while the other one doesn't. If anything,
16 that's what can make it slide.

17 I don't have an answer for you in that regard.
18 I hadn't thought about it, but it is, at least,
19 theoretically possible, that if you have the pipe
20 actually moving and swaying and the frame lags behind it
21 because its inertia, well, you still have the whole base
22 of the support also moving the same way because that's
23 the whole building. Then you have to look at the
24 relative motion of the support itself.

25 MR. TERAQ: That's right. But it's a 10-10

1 support so, basically what you have.

2 MR. IOTTI: In that, actually is a pin roll
3 support, with a roll of the pipe.

4 MR. TERAQ: What do you mean by roll?

5 MR. IOTTI: Well, it's essentially capable of
6 sliding up there. You can't pin it.

7 MR. TERAQ: Oh yes, but what I'm referring to is
8 the effect that you're basically getting of that
9 support. And the frame is that, the same type of effect
10 you would see from swinging chandeliers.

11 MR. IOTTI: No, no. I don't agree with that.
12 Because, first of all, in a seismic event this thing is
13 also moving up and down, and sideways, in addition to
14 just axelly. If you have pure axel movement, I would
15 only see it your way, but since this is now making
16 contact at various points, during a seismic event, you
17 don't have the same thing.

18 MR. TERAQ: Without the pipe, you would have
19 the chandelier.

20 MR. IOTTI: Oh, yeah.

21 MR. TERAQ: What you're saying is that, it is
22 reacting against the edge of the plant. I guess my
23 problem from this point is that there's so much
24 vibration going on that the plant can literally walk.

25 MR. IOTTI: This is why I said if it walks,

FREE STATE REPORTING INC.

Court Reporting • Depositions
D.C. Area 261-1902 • Balt. & Annap. 269-6236

1 unless it can also rotate, it walks, it will tend to
2 walk back towards the position of the lineman because
3 that's the minimal management position.

4 MR. TERAQ: That was based on your testing where
5 the exertation was coming only from the support itself.

6 MR. IOTTI: Right. But really, when you think
7 about it, what is the difference? Suppose we'd even had
8 moved the pipe, the same thing would have happened.
9 See, the support is still be excited in the proper
10 manner. Support is on the floor and you're shaking it
11 up, down, and also, in this direction. Don't forget, we
12 put in the load at an angle, within conial angle, so we
13 could excite both the axel, the vertical and the
14 lateral. So the support was being excited in three, in
15 three directions. And what we found, sure enough, is
16 that if you don't prevent rotation and you can also
17 imagine the pipe moving at the same time, for all we
18 know, for it was moving, incidental. And it was also
19 being excited, actually to a far lesser degree, but
20 laterally. You can imagine if you start rotating, and
21 we'll show you the picture, it would walk away but if
22 you can't rotate, it actually pulls it back. Then it
23 sits. Once it finds its position where it likes to be,
24 it'll sit there. And, unless the earthquake radically
25 changes, it isn't going to move from there.

1 MR. IOTTI: That's what I'm saying. Implicit in
2 this is you have a certain length to look that permits
3 it to slide that distance back. We can actually prove
4 mathematically whether you're right or not, if we wanted
5 to do a following on this.

6 MR. TERAQ: No, no. Now, that is what I am
7 trying to avoid if we can't reach any resolution on this
8 but, if I prove this mathematically,

9 MR. IOTTI: Let me ask John a question that
10 maybe makes this whole thing mute. Do we have any
11 modifications?

12 MR. FINNERAN: We have one of the index lug.

13 MR. IOTTI: If you had said zero, we could have
14 stopped right there.

15 MR. FINNERAN: Well, we have one of them.
16 That's why it's on the table. If we didn't have any, it
17 wouldn't be in the (inaudible).

18 MR. FLECK: How long, what's the lug length?

19 MR. FINNERAN: Well, this particular support as
20 a matter of fact, is on a vertical run of pipe, right
21 below a penetration into the force lab.

22 MR. FLECK: Oh, so it has to have a vertical.

23 MR. FINNERAN: There are lugs on the pipe to
24 hold the support to keep it from moving down the support
25 and it can't go up the support because it,

1 MR. IOTTI: So, then it can't slide anyhow. So
2 it's a non-problem, because it can't slide to begin
3 with.

4 MR. FLECK: I think I remember that. It's right
5 by the floor level. Right under the floor. The floor
6 level won't permit that excess dimension of the frame to
7 drop through it. Do you have a support number on this?

8 MR. IOTTI: I think that may be the easiest way
9 to dissolve it. Just give you the drawing of that
10 support and you can take a look and satisfy yourself.
11 It won't rotate, nor will it slide.

12 MR. FLECK: Otherwise, I guess, if you wanted to
13 at least eliminate the problem, you put the lugs with
14 another vertical (inaudible) that comes out horizontally
15 from the pipe to stop it from going, ..

16 MR. IOTTI: Well, you can put a lug and then a
17 larger log that contains the frame.

18 MR. TERAQ: That doesn't necessarily mean that
19 stirrings have been put to bed. What line is this on?
20 Do you recall?

21 MR. FINNERAN: I believe, it is, let's see.
22 CTR.

23 MR. TERAQ: Do you have the support number
24 there?

25 MR. FINNERAN: Yes. I think it's one of the,

1 support in the OR disc, I believe. I think it's
2 CT1008008F22K.

3 Chatter.

4 MR. IOTTI: At this point, I guess the best way
5 to proceed is to look at the drawing.

6 MR. TERA0: Yes, I'd like to look at the
7 drawing.

8 MR. FINNERAN: This particular one actually has
9 two snuggers coming into the frame. So it's not a
10 single.

11 MR. TERA0: How's it going to rotate?

12 MR. IOTTI: I don't believe that particular
13 frame would function in a stable manner. We just
14 decided to do something extra. I think I stated that
15 back in September 82 Hearings. First thing about Dr.
16 Cole, that we were talking about one of the Dole's
17 frames. One that had a struc in, tow strucs coming to
18 the front. Neither he nor I thought that was unstable
19 frame. Regardless, we modified the frame.

20 MR. FINNERAN: I think it also gets into the
21 question of safety concern. Is there a potential safety
22 concern? What could actually happen to this type of
23 arrangement?

24 Of course, I'd be hard pressed to tell you or to
25 tell anyone why there is a problem here, but, on the

1 other hand, because of the unusual design it would be
2 very difficult for you to prove conclusively that the
3 design is working too. You get into arguments, such as,
4 impacting, if the frame is excited in a vertical
5 direction. If it is indeed stopped by a, by the lugs
6 then you could have the frame then basically bouncing on
7 the lugs. You could get some type of loading that way
8 that is not accounted for.

9 There is just too many uncertainties with this
10 type of design.

11 MR. IOTTI: The frame is still a contact frame.
12 That's my understanding. Is that right?

13 MR. TERAQ: What I'm trying to get at, is this
14 design, even in an excellent additional struc,

15 MR. FINNERAN: It's very difficult to show
16 analytically that the design is going to work. You
17 would have to do some type of non-linear analysis, maybe
18 a time history analysis, to show conclusively that,

19 MR. TERAQ: Why do you think this struc wouldn't
20 work? (inaudible) and I think you can show
21 analytically that frame will not slide down the pack.
22 If this support is performing its function it has a load
23 on the detension or depression. If it doesn't have that
24 load on it, it's not going to go anywhere.

25 MR. IOTTI: That's why I need the drawing and

1 the next time at the site look at the support itself;
2 see what type of gaps, what type of rattling the frame
3 could have.

4 MR. FINNERAN: What one?

5 MR. TERAQ: The index lugs.

6 MR. FINNERAN: I hate to say it, but sometimes
7 it might even come down to an engineering judgment of
8 whether or not that support is going to work, cause you
9 may not even be able to show analytically without some
10 extremely expensive analysis for this single frame. It
11 may not even be worth it for a single frame. I don't
12 understand why a simpler fix wasn't initiated. But
13 that's water over the dam.

14 I guess what I'm saying, all right, we have one
15 of these index lugs, but still the basic problem comes
16 down with the additional struc modification where you
17 get into an area where the clamping mechanism around the
18 pipe is not a controlled factor. It's not like a
19 typical clamp where you can tighten the bolts, and
20 assure through the tightening of the bolts, that the
21 clamp is going to perform its function.

22 This is one of the basic problems I've had with
23 these designs from the start. The type of clamping
24 mechanism that you're relying on, there's either
25 friction, or the type heating up in these box frames.

1 It is not controlled. There's just too many other
2 physical factors that can affect that clamping
3 mechanism. Therefore, the box frame itself can lose its
4 clamping function.

5 This goes back to my initial definition of what
6 do I mean by unstable? By instability? What I'm
7 talking about is whether a clamp or support can lose its
8 function and become ineffective and possibly move to an
9 undesirable or unanalysed position.

10 MR. IOTTI: Well, you'll agree that one could
11 not rotate. Here, your concern would be with sliding
12 only.

13 MR. TERAQ: Yes.

14 MR. FINNERAN: I think you can show on
15 additional struc that analytically that frame will not
16 slide.

17 MR. IOTTI: It might slide, but how far can it
18 go, because the struc has a finite length? The
19 difference is when we test, like we did it, is when it
20 started sliding, the testing apparatus compensates and
21 increases the stroke until we were unable to increase
22 the stroke any further, then we couldn't trust it with
23 the load. But the floor, which transmits the seismic
24 event, will not do so. And so, finally it will slide
25 but it's controlled in terms of sliding by the presence

1 of the pipe, and the fact that you had to find that
2 length struc.

3 Well, what he's saying, you'll have a hell of a
4 time proving it analytically. I may even compare with
5 him. It comes right down to someone's engineering
6 judgment. Just proving it analytically will cost you
7 more than modifying the damn frame.

8 MR. TERAQ: So, I don't want you to take my
9 signals as meaning I want more analysis done.

10 MR. IOTTI: No. I understand. I know when
11 analysis is essentially, you're running cross the law of
12 diminishing returns. There's no sense in doing it.
13 We think if you were to look at the plan your
14 engineering judgment would, in all likelihood, concur.
15 I really don't see where they would slide. Then, I
16 guess I would make the same statement as I made on the
17 previous one. If it slides, I think it would slide back
18 into the position where it's been. It's more on line
19 rather than less on line.

20 MR. TERAQ: You see the difficulty that we're in
21 right now to show this analytically would be too
22 expensive.

23 MR. IOTTI: And you probably (inaudible) the
24 results anyhow.

25 MR. TERAQ: That's true. You could question

1 more of the analytical techniques, and go on endlessly.
2 On the other hand, to show that it's a problem
3 I can't do that either. You can't even show that this
4 thing can fail. You can make many assumptions but many
5 of the assumptions you make are just as invalid.

6 MR. IOTTI: The key is the very statement that
7 you made. Will it, even it moves, will it retain the
8 function? In other words, would it be able to move
9 sufficiently so that it cannot transmit the load? Or
10 would it change the configuration of the note of the
11 pipe? Don't forget. This is all seismic stuff. That's
12 what we're talking about.

13 Let's say, it moves an inch even. Would an inch
14 make a difference in the piping analysis? If the
15 support were an inch downstream or upstream, wherever
16 it's located, provided it can still carry the load?

17 That's the kind of engineering judgments that we
18 have to use with these supports. The only way you can
19 exercise is by actually looking at it.

20 MR. TERAQ: I think my basic concern here is
21 still the fact that from an operational loading, whether
22 or not these supports can move. Suppose it moves to a
23 position before the seismic event? I'm not saying that
24 it can move just only during the seismic event, but
25 there's enough vibration in the plant on some of your

1 piping systems.

2 MR. IOTTI: There has been vibration in the
3 piping system already at that plant. I've been there.
4 I've been going through the pre-op testing. You would
5 have seen if there had been something flagrant, you
6 would have seen it.

7 We tend to forget that but this plant has gone
8 through (inaudible) one and have you noticed that
9 anything of this sort has happened, or moved?

10 MR. FINNERAN: Well, these particular. I know
11 one of these double structures in on the compound
12 (inaudible) system and that thing has actually been in
13 operational testing for over a year.

14 MR. IOTTI: So, you know, if you want we can
15 take a look at it and measure it before and after.
16 Maybe we should have data before, where it was. What do
17 you think, Bill?

18 MR. HORIN: I don't think it's moved. I don't
19 think it's moved at all.

20 MR. TERAQ: And that system vibrates.

21 MR. CHEN: How many of these do you have?

22 MR. FINNERAN: I know the total of all three of
23 these is 12.

24 MR. TERAQ: You get the additional struc is a
25 modification, what I would confirmed is this original

1 type 1 frame, box frame with single struc snuffers, are
2 there other additional double struc frames that were
3 always considered to be stable from the very start.

4 MR. FINNERAN: Oh, possibly. I don't know.

5 MR. BURWELL: I don't understand where that
6 question is going.

7 MR. IOTTI: He feels he is not in agreement that
8 this is a proper modification. That any other frame
9 that we may not have included in this list because it
10 had double strucs and would therefore consider stable.
11 He would then question those also.

12 MR. BURWELL: I would agree but I don't think he
13 should reach this conclusion on a double struc frame.
14 To say that the system is stable--there's many
15 uncertainties involved here. Perhaps the frames on the
16 component cooling water had enough friction on it so it
17 wouldn't move but suppose there are other frames where
18 you don't have as much friction. In other words, it's
19 not controlled. You don't have a controlled method of
20 clamping that frame around the support, I mean around
21 the pipe.

22 MR. TERAQ: So, in that sense, I would find it very
23 difficult to agree with this modification when I don't
24 physically know what is out there in the plant.

25 MR. HORIN: Even if you assume the worse case

1 scenario that you think could create some instability,
2 what exactly do you think would happen that would cause
3 it to be unstable? Is it simply sliding up and down on
4 the pipe?

5 MR. IOTTI: That's the only thing that could
6 happen in this particular instance.

7 MR. TERAQ: Well, let me ask you this? Let's
8 not talk about these clamps at all but let's just talk
9 about a standard clamp on a snubber. You're running an
10 in-service inspection and you found that the clamp had
11 moved several inches down the line, would you think that
12 was a major problem? Would that be identified as a
13 deficiency?

14 MR. IOTTI: Well, not necessarily a deficiency.
15 It would be identified. I don't know whether it's a
16 deficiency or not.

17 MR. TERAQ: It has to be corrected.

18 MR. IOTTI: It has to be determined unless it
19 can be proved that it doesn't matter.

20 MR. WADE: Move it back to its original
21 position and (inaudible) the bolts.

22 MR. IOTTI: Not always, Dave. Let me correct
23 you. Sometimes you find it had moved because to begin
24 with it was wrong and where it moved to is where it
25 ought to be. So the fix is not to take it back. It's

1 to leave it where it is.

2 MR. WADE: If we move it where it ought then
3 they would not have known it moved.

4 MR. TERAQ: Well, not because they noted where
5 it was to begin and they thought it was correct where it
6 was.

7 MR. IOTTI: We assist by how much one could
8 physically slide. I think that's the key. You can't go
9 too far.

10 MR. TERAQ: We could go with Dave, take him to
11 look at all of these frames and have him assist for
12 himself. Even if it slides. How far can it go? Maybe
13 it can only move an inch. Now, maybe an inch is
14 important. I don't know what the answer is. I'm not
15 saying. Maybe an inch is terrible. But it also may be,
16 your span may be 20 feet long and you move one inch on
17 either side of the span. That is less than the
18 tolerance that you normally supply when you install the
19 support in.

20 MR. IOTTI: This is the kind of consideration
21 that we have to look at. Clearly, it's only a sliding
22 consideration. Forget about the other things that you
23 brought up, which are valid. Possible impacting.
24 That's true. It's possible.

25 MR. TERAQ: Now, I agree. The difficulty here

1 is not that we're saying these are safety concerns but
2 the difficulty is trying to address these summary
3 dispositions on whether or not these modifications are
4 acceptable. That is a totally different ballgame
5 because I can say I don't believe there's any safety
6 concern. But on the other hand, I can't say in my
7 Summary Disposition that I think these modifications are
8 acceptable.

9 MR. IOTTI: Well, you must say what you agree to
10 be right. What else can we do? We're at an impasse
11 here. Clear, that we do believe that this is a proper
12 fix. If you don't agree, we may have to modify it
13 further. There comes a point in time where we're not
14 foolish either. It's a lot cheaper for us to go fix it
15 then try to fight you on this. We're not talking a
16 large number.

17 MR. WADE: I think it's important that you come
18 and look at it. I really do.

19 MR. TERAQ: The difference is I can go look at
20 it and say it's no problem. Another person can go look
21 at it and say there is a problem.

22 MR. WADE: I think any practical, sound
23 professional engineer would have to agree.

24 MR. BURNWELL: Okay. I think we have reached a
25 good break point here and so with that, let's close for

1 the day and we will come back tomorrow morning at nine
2 o'clock and continue with our discussions on stability.

3 Thank you.
