ADDENDUM

<u>Page</u>	<u>Line</u>	<u>Correction and Reason for Correction</u>
6	5	Delete "new" Wrong word
6	6	Add "NU" in front of "REG" To complete the word NUREG
6	10	Add a comma after "and" Punctuation error
		Change "to" to "two" Incorrect word useage
		Add a comma after "two" Punctuation error
6	22	Change "excepted" to "accepted" Wrong word
8	17	Change "long" to "low" Wrong word
8	19	Change "and" to "in" Wrong word
13	22	Change "I'll" to "I" Wrong tense
		Change "discuss" to "discussed" Wrong tense

(10:06 a.m.)

MR. ROSS: Good morning. We're here to discuss the conclusion of an investigation that was done by the Nuclear Regulatory Commission.

We'd like to get some identification of speakers. My name is Denwood Ross. I'm an employee of the Nuclear Regulatory Commission, and my job function is Deputy Director of the Office for the Analysis and Evaluation of Operational Data.

MR. GLENN: And my name is John Glenn. I'm also with the Nuclear Regulatory Commission. My normal function is as a Branch Chief in our Office of Research having to do with rule making. I was the team leader for this particular investigation.

MR. LITSER: My name is David Litser. I'm a professor of Physics and Vice President for Research at MIT.

MR. MASSE: My name is Frank Masse. I'm the Director of the Radiation Protection Programs at MIT and the Institute Radiation Protection Officer.

MR. ROSS: I'll say a few general remarks, and then Dr. Glenn will discuss the results of the investigation. At the end of the discussions, we would be available for questions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 The report of this investigation was prepared
2 and finalized and issued yesterday, and copies are
3 available. The report title is New Reg., number, that is,
4 New Reg. 1535, and it was sent to the NRC's public
5 document room last night.

6 As you may be aware, there was a similar event
7 in Maryland at the National Institutes for Health. Some
8 conclusions and recommendations common to the two events
9 in question may be discussed soon at an open meeting of
10 the Nuclear Regulatory Commission. The exact time is not
11 known for sure. It possibly might be December 19th, but
12 we're still working on that.

13 This work that Dr. Glenn will describe is the
14 by-product or work product of what's known as an Incident
15 Investigation Team. It's a formal process for events of
16 significance, and, in general, we average about one of
17 these investigations per year, and they cover all of the
18 licenses that the NRC administers including reactors and
19 materials, field fabrication facilities and source
20 transportation and so on.

21 At the end of the work, that is, what's the
22 next step is we have to extract what are known as actions.
23 There's conclusions and findings in the report, and then
24 the actions are developed separately. Some of the actions
25 may be generic, say, by rule making. In principle, some

1 could be for the licensee involved and some reflect back
2 on how the NRC itself functions.

3 We will track these actions to completion.
4 Frequently, it takes several years. We develop close-out
5 reports, and in our annual reports, we describe what the
6 percentages of completion until we finally closed out all
7 of the actions.

8 What I'd like to do now is turn it over to Dr.
9 Glenn to discuss his report.

10 MR. GLENN: Thank you, Dr. Ross.

11 I'd just like to remind everyone that we had a
12 similar exit about five weeks ago. I promised at that
13 time that at the conclusion we would issue our report and
14 that our findings and conclusions would be available
15 publicly at that time, and I'm here today to complete that
16 promise and to summarize the findings and conclusions that
17 are in the report that was issued last night.

18 I'll remind everything that this meeting, as
19 at the previous meeting, is being transcribed and that a
20 record of the meeting will be available in the public
21 document room when the documents that support the report
22 are put into the public document room.

23 I'll also mention that at the conclusion here,
24 we will give MIT a chance to respond to our report and
25 that they also have a period of 30 days in which to submit

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 a written report to the NRC in terms of any errors that
2 they think may have been identified in the report.

3 The first item I'd like to discuss is the
4 team's conclusions regarding the exposure of the
5 individual who had the ingestion of P-32.

6 One thing I would like to note is that the
7 team's job was greatly helped by the availability of very
8 good data from two different methods of measuring the
9 intake. We had, both, excretion data and retention data
10 from whole-body counting.

11 The quality of the data was very good. It
12 allowed us to do a lot of different things with the
13 analysis that we may not have been able to do if the
14 quality of the data had not been as good as it was.

15 The statistical error is very small, and I
16 will, in a minute, discuss some of the systematic errors
17 that could occur, but the conclusion of the team was that
18 the estimate submitted by, or the reported dose that MIT
19 submitted to the NRC on October 16th is correct.

20 It's in accordance with the guidance that has
21 been put out by the NRC. It's in accordance with the
22 recognized biokinetic models put out by the International
23 Commission on Radiological Protection, and we did our
24 independent calculation based on the data and came up with
25 essentially the same number.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 The weighted mean of the NRC's estimate was
2 570 microcuries based on a 580 microcurie estimate based
3 on whole-body counting and a 560 microcurie count based on
4 the urine data.

5 And in doing that, we rigorously followed new
6 Reg. 4884 which is the NRC's guidance on doing this kind
7 of analysis.

8 However, again, because the data was so good,
9 we did look to see whether we could, one, quantify the
10 errors that might occur in the measurement process and to
11 see whether the data was good enough to support an
12 individual specific model.

13 Our guidance does say that in the case of a
14 significant exposure that licensees can do individual
15 specific modeling, and if the data's good enough, that
16 that should be done.

17 One of the major sources of uncertainty would
18 be the fraction of the ingested material that is excreted
19 in the urine, and there are literature values that run
20 from .6 to
21 .9 as the fraction that is excreted in the urine.

22 The ICRP model states .9 as the excepted one;
23 however, if you take an average of what's reported in the
24 literature of .75, you could interpret the urine data to
25 indicate an intake as high as 680 microcuries, so we have

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 a range of between 570 and 680 based on that uncertainty
2 in the literature.

3 I will note, however, that we did do some
4 comparisons, since we had both excretion and retention
5 data, and we essentially tried to solve for the, the
6 excretion fraction based on the comparison of those data.

7 We came up with an excretion factor of 1.0
8 plus or minus .2 which indicates that .9 is a very
9 reasonable value for this particular individual and that
10 is what we used in our analysis.

11 Another uncertainty is the geometry factor for
12 the whole-body counting. The counter here at MIT does not
13 look at truly the whole body. It looks at the neck to the
14 knees, so there is a mass of body that is not looked at in
15 the counter, and so we did some estimate of what the
16 uncertainty factors might be there.

17 MIT has used a geometry factor of .65 based on
18 studies that were done a few decades ago. We looked at
19 that and decided it was a reasonable factor.

20 However, we did note that as times goes along,
21 more and more of the P-32 is going to be, essentially,
22 locked up in the bone and that perhaps the .65, although
23 it may be a very good factor for tissue, may not be as
24 representative of the bone distribution within the body.

25 So, we decided that you could have a variable

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 from a geometry factor of .5 to .65 which could then
2 indicate a range of values from 570 to 740 microcuries.

3 However, there's an opposing effect in the
4 whole-body counting. The phantom that MIT uses is a
5 masonite phantom with the P-32 contained in water bottles
6 that are used to simulate organs.

7 Water is, in fact, a very good surrogate for
8 tissue. However, it is not a very good surrogate for
9 bone. It turns out bone has a higher average atomic
10 number, and, therefore, will be more efficient at
11 producing bremsstrahlung, so we would expect that P-32
12 that is in bone would, in fact, produce more counts per
13 ingested activity than would the tissue component.

14 There's a factor of about 1.5 in the average
15 atomic number between tissue and bone, and so that would,
16 from the 570 that we measured using the standard model,
17 you could go down to as long as 380 microcuries if that
18 were the only variable.

19 We take note that those two effects and the
20 whole-body counting tend to counteract each other and that
21 it means probably that the mean value may be more
22 representative than any of these extreme values.

23 Again, we had a contractor, as well as
24 ourselves, look at the data to see whether we could, in
25 fact, come up with individual specific parameters rather

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 than the standard biological parameters for publishing the
2 literature for what's called a reference or standard man.

3 If you vary the parameters to get the best
4 simultaneous fit of the urine and whole-body data, you
5 come up with a value, again, amazingly, of around 550, 570
6 with a range of about plus or minus 50.

7 What that attempts is to do a joint fit and
8 come up with an individual specific model comes up with is
9 for, to best fit this data, you need to assume that more
10 of the isotope ended up in tissues than in the standard
11 model, less ended up in bone than in the standard model
12 and that the tissue component was retained for a longer
13 period than in the standard model.

14 The standard model for the tissue component is
15 19 days. The best fit was obtained for something around
16 32 days. As it turns out though, that doesn't make a big
17 difference in terms of the evaluation, and so, again, in
18 the end, we conclude that following the standard model is
19 the correct approach and that the 570 is a good number and
20 that an overexposure did not occur.

21 Our first conclusion was that the exposed
22 individual most likely ingested P-32 as a result of a
23 deliberate act by a knowledgeable person. That is not a
24 finding of fact. We did not, in fact, identify exactly
25 how the ingestion occurred.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 It is a finding though of the weight of the
2 evidence that it's our conclusion that it's more probable
3 that it was deliberate than that it was accidental.

4 Why did we come to that conclusion? The first
5 is that the exposed individual worked with levels that
6 were normally 50 microcuries and that accidental spills
7 that would be expected working with those kinds of
8 quantities couldn't result in an intake of 500 plus
9 microcuries.

10 The next fact is that the, the amount of
11 activity that was ingested is comparable to or a large
12 fraction of the, the maximum quantity that's in the lab at
13 any time. It's very difficult to imagine many accident
14 scenarios where the bulk of the inventory ends up being
15 ingested.

16 The next finding that supports this is that
17 the P-32 in the experiments was shipped to the laboratory
18 in frozen form and was kept frozen in freezers until just
19 before an experiment. Therefore, to get that quantity
20 involved in an accident, it had to have been thawed first,
21 and that should be a relatively restricted opportunity in
22 time and space.

23 I think the main thing was that our own
24 experience is that if there is an accident with P-32, a
25 spill, the contamination is, in fact, pervasive, that you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 find it everywhere.

2 P-32 is very easy to detect. If it's spilled,
3 you find it being tracked out into hallways, into cars, in
4 homes. You can find it just about everywhere.

5 Extensive surveys after this incident didn't
6 find any contamination of those kinds of areas.

7 The other thing is that an inventory performed
8 shortly after indicated that there was a missing amount of
9 activity that is approximately the same value as the
10 activity that was shown to be in this body.

11 Finally, we determined that there was
12 opportunity for this to occur because the security of
13 radioactive materials was weak in the building in which
14 the laboratory was located. There were many people who
15 could have had access to it, and we also found that there
16 was occasional practice among laboratories of borrowing
17 material, so there was opportunity for this act to occur.

18 Our second conclusion was that the amount of
19 radioactive material ingested by the researcher is not
20 enough to cause clinical symptoms or acute effects; and,
21 therefore, we concluded that any symptoms that may have
22 been experienced were due to factors other than radiation
23 exposure.

24 We base this finding on the report of our
25 medical consultant who had access to the individual's

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D. C. 20005

1 medical records, and I'd like to acknowledge our
2 appreciation to the exposed individual for his cooperation
3 with us. He did give us access to medical records and
4 that sort of thing.

5 And so our medical consultant had access, and
6 he also looked through the literature, and he depended
7 upon his own experience in terms of treating patients with
8 activities of P-32 ten to twenty times what was involved
9 in this particular case.

10 Some of the things that he noted in his report
11 were there were no symptoms reported by the exposed
12 individual before the discovery of the contamination, that
13 the symptoms reported by the individual were not
14 consistent with those that would have been expected from
15 the radiation exposure.

16 In this respect, I will note that we did have
17 blood data for the individual from both before and after
18 the intake and that there was no indication of blood count
19 changes that would have been expected from very large
20 exposures to P-32, so this does say that there couldn't
21 have been an exposure that was much greater than indicated
22 by the bioassay data.

23 Cases reported in the literature for intakes
24 that were twenty to fifty times larger than involved in
25 this ingestion, these kinds of symptoms were not noted.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 There were detectable effects at twenty to fifty times
2 larger doses, but they were not the ones that were
3 reported.

4 The other thing is that patients who are
5 routinely injected with P-32 for medical treatment with
6 much larger doses do not show the kinds of symptoms
7 reported by the individual.

8 Our next conclusion was that the security of
9 radioactive materials in storage and control of
10 radioactive materials in use at the Center for Cancer
11 Research were weak, and some of our findings that led us
12 to that conclusion were that the crowded laboratory areas
13 and benches limited the line of sight so that workers
14 really couldn't see people who were entering and in the
15 area and they didn't have constant surveillance of the
16 areas where the material was stored either.

17 The stock vials which contained the large
18 amounts of activity were stored in an unattended freezer
19 in the laboratory, and the freezer did not have a lock
20 before the contamination incident.

21 I will note that before we arrived, that had
22 been locked. We did find other problems, and I'll discuss
23 those at the last exit.

24 We were told by licensee personnel that
25 radioactive materials were locked during evenings and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 weekends when unattended; however, when the team was here,
2 we found that, in fact, we could have access to these
3 areas where they were stored in the evenings and on the
4 weekends. And, in fact, we were able to enter through the
5 main door to the building where the material was used.

6 Finally, there were no required procedures for
7 recording material removed from stock vials or recording
8 material used during research, so there was very little
9 personal accountability for radioactive material that was
10 used in the laboratories.

11 And, again, corrective actions had been
12 initiated before we arrived to improve that process and to
13 make it so that access was limited and that people were,
14 in fact, logged in and out when they took material.

15 Our next finding was that the Radiation
16 Protective Office exercised weak oversight with regard to
17 storage and control of radioactive material in use in
18 unrestricted and controlled areas.

19 The findings we based this conclusion on were
20 that the radiation protection procedures informed users
21 only that they must store radioactive materials to prevent
22 unauthorized removal, but did not suggest acceptable
23 methods of doing so.

24 Also, the MIT radiation protection procedures
25 did not include requirements for maintaining constant

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 surveillance of radioactive materials used in unrestricted
2 or controlled areas which were not in storage.

3 Surveys in audit forms that the Radiation
4 Protection Office staff members used did not list security
5 of radioactive material among the items for routine
6 review.

7 Finally, the Radiation Protection Office
8 staff, including the Radiation Protection Officer, stated
9 that the Center for Cancer Research was locked during the
10 evenings and on weekends and that only individuals knowing
11 the key pad could enter the building. When we tested
12 that, we found that it didn't pass the test.

13 Our next conclusion was that NRC's regulatory
14 standards and guidance for security and control of by-
15 product material were inconsistent, and this is a little
16 complicated, so I'm going to try to walk you through our
17 reasoning on that.

18 The first thing we noted was that the
19 regulations in our Part 20 are very clear in what they
20 state. One, the licensee shall secure from authorized
21 removal or access licensed materials that are stored in
22 controlled or unrestricted areas; and, two, the licensee
23 shall control and maintain constant surveillance of
24 licensed material that is in a controlled or unrestricted
25 area and that is not in storage.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 Very clearly, there is no escape clause.
2 There is no lower limit of quantity of licensed material
3 to which these regulations apply. That was reinforce when
4 these regulations were being adopted a few years ago in
5 the statements of consideration, and there was a comment
6 that asked about, well, did we really mean that
7 particularly for areas where small quantities were used in
8 university research.

9 The NRC response stated that locking radio
10 tracer laboratories when they're not being used is a small
11 nuisance compared to the consequences of unauthorized
12 access or theft, so, again, we essentially said the clear
13 meaning of the words is the clear meaning of the words.

14 However, with the adoption of the new Part 20,
15 we also issued some guidance documents, questions and
16 answers regarding the interpretation of Part 20, and there
17 was a question that asked if the regulations that covered
18 this area would be imposed, first, on all quantities of
19 licensed material, however small, and, B, specifically, on
20 quantities that are exempt from labeling in accordance
21 with the regulations.

22 We said: 'No, it would not apply to all
23 material no matter how small the quantity, and, no, it
24 would certainly not apply to those quantities of material
25 that didn't require labeling.'

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 So, we now have a contradiction between our
2 statements of consideration and our questions and answers.
3 We then had a follow-up question, someone who read the
4 answer to our first question and said that that was a very
5 useful interpretation, but inquired about the supporting
6 justification since it was not evident in the regulations.

7 We, again, answered that what we said before
8 held.

9 We've also put out license specific guidance
10 that reaffirms the position that for small quantities,
11 those less than those requiring labeling, did not require
12 the same standard of security and control as was in the
13 regulations.

14 A compounding factor is that these small
15 quantities that do not require labeling, according to the
16 regulations in Part 20, are very similar in quantity to a
17 list of activities in our Part 30 which can be exempt from
18 licensing, so there is a very close similarity between
19 materials that a person who doesn't have a license from
20 the NRC can receive and these unlabeled quantities.

21 Finally, we noted that although the NRC
22 regulations included many requirements to report thefts,
23 losses and incidents involving very small quantities of
24 licensed material, the NRC regulations required only
25 records of receipt and disposal of licensed material.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 We do not have specific guidance or
2 requirements for the accountability of materials in use.
3 Our next conclusion was that while the team found
4 weaknesses in the actions taken by the Radiation
5 Protection Office, the licensee's overall response was
6 good.

7 Some of the strengths that we identified: the
8 Associate Radiation Protection Officer and Assistant
9 Radiation Protection Officer arrived on site within one
10 hour of notification, and they had previously communicated
11 with the people on the site who were tending to the
12 exposed individual.

13 The Radiation Protection Office staff took
14 immediate actions to confirm the lack of external
15 contamination on the researcher, and they also surveyed
16 the laboratory and surroundings and the personal residence
17 of the exposed individual. All of that was done promptly.

18 The Radiation Protection Office staff took
19 follow-up actions to expand these surveys and to confirm
20 the initial findings. They used two methods of bioassay:
21 whole-body counting and urine analysis. And I've already
22 pointed out that that was extremely helpful to us in terms
23 of assessing the actual intake to the researcher.

24 The other thing is that they continued the
25 sampling for approximately 60 days which, again, allowed

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 us to do a lot of interpretation.

2 The staff took appropriate actions to ensure
3 proper calibration, the whole-body counter and liquid
4 scintillation counter, and the licensee took actions to
5 suspend all use of radioactive materials in the affected
6 laboratory until an inventory could be performed, and
7 before restoring authorization to use materials, they took
8 actions to secure all stock radioactive materials in the
9 laboratory and to reduce the likelihood of recurrence of
10 this event.

11 We did identify some weaknesses. One, the
12 radiation protection staff did not give researcher, A,
13 written instructions on urine collection. This resulted
14 in some confusion and some misleading initial data, so the
15 very earliest excretion data was not useful because of
16 this confusion.

17 I'll just mention that in terms of actions, we
18 think this also may come back to the NRC as well because
19 in looking at our own guidance, we have not provided
20 licensees with much guidance in this particular area on
21 the collection of samples.

22 The calculations associated with the
23 licensee's initial intake assessment were weak, and the
24 licensee initially failed to properly account for the
25 geometry factor of the whole-body counter.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 This was corrected rather rapidly, but in a
2 conclusion I'm coming to in a short while, I think it did
3 play a role.

4 The licensee did not apply increased controls
5 of radioactive materials to the entire Center for Cancer
6 Research; however, when this weakness was found by the
7 team, the licensee responded by securing all radioactive
8 materials in the Center.

9 Our next conclusion was that management
10 oversight to the Radiation Protection Program was weak.
11 The licensee did not use a process of management review
12 and self-assessment to find weaknesses in their program
13 and to take appropriate remedial actions.

14 We based this finding on violations that had
15 been documented in the NRC Inspection Report in 1995 that
16 included the failure of the Radiation Protection Committee
17 to review the program in 1993 which was a commitment in
18 the license.

19 In our interviews with Radiation Protection
20 Committee members, they stated that they did not perform
21 audits of the Radiation Protection Program and did not
22 perform random checks or performance outside their own
23 laboratories.

24 Radiation Protection Committee members also
25 stated that they depended on the Radiation Protection

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 Office to inform them of problems and program status. The
2 Committee was not notified of the August 14th event until
3 the week of September 12th.

4 I'll just note that in the interviews with the
5 committee members, most of them, when we asked specific
6 questions about practices that we had observed in the
7 Cancer Center, indicated that they would not have
8 permitted those in their own laboratory.

9 And we think that's an advantage of having the
10 independent look by an outsider who's not directly
11 affected by the program and other than the normal
12 oversight group that does it on a routine basis taking a
13 look because that third party who's not used to what's
14 going on, isn't making assumptions about what is going on
15 can, in fact, have insight and can help the institution
16 improve their program.

17 The final conclusion relates to the reporting
18 requirements. The NRC reporting requirements were not
19 specific regarding intentional contamination, the NRC
20 reporting requirements for intake were unclear; however,
21 sufficient data was available within the first week to
22 indicate the event threatened to cause an overexposure.

23 Certainly, one of the things we were able to
24 do in short time was to look through the regulations to
25 determine that NRC regulations do not require licensees to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 report deliberate acts involving ingestion of radioactive
2 materials.

3 We noted that the licensee stated that the
4 decision not to report the event was partially based on
5 their finding that the dose to ingestion of P-32 would be
6 delivered over a period of weeks instead of a 24 hour
7 period.

8 When we interviewed NRC personnel to ask for
9 interpretation of this, we got different interpretations
10 from different members on the staff, some people who felt
11 that it was clear that committed effective dose equivalent
12 meant that the dose was received immediately upon intake
13 and others who felt that the plain meaning of the words of
14 the regulation was that the dose itself had to be received
15 over 24 hours.

16 The licensee stated that their decision not to
17 report the event was primarily based on their findings
18 that all data indicated that the quantity involved in the
19 intake was less than the limit stated in the regulations.

20 However, we feel that the data available in
21 the first week indicated a possible dose in excess of
22 600 microcuries. Additionally, we noted that the
23 researched, himself, gave the licensee estimates in excess
24 of 600 microcuries within the first week.

25 We feel those factors met the threshold in the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 regulation of "threatened to cause." In particular, we
2 noted that there was contradictory data. Some of the data
3 in the first week projected a result that was less, some
4 of the data projected a dose that was greater than the
5 limit, and our conclusion was that the threshold of
6 "threatened to cause" was met.

7 Finally, we attempted to do a root cause
8 analysis. However, the team concluded that since we could
9 not, in fact, say what caused the ingestion, we could not
10 come to a conclusion as to motive or intent or exactly how
11 it occurred, that the best we could do was to identify
12 some contributing causes of the ingestion.

13 I'll take note that these causes are really
14 more things that could have been done to perhaps prevent
15 or deter the incident from occurring.

16 Our first contributing cause was that MIT's
17 program for control and security of radioactive materials
18 was not effective to deter or detect diversion of
19 radioactive materials.

20 We're not saying that security and control in
21 itself could prevent a person who is authorized to use
22 radioactive material from doing something with that
23 radioactive material that they shouldn't; however, we do
24 feel that strict accountability and security of materials
25 is a very big deterrent towards anyone attempting to do

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 something like this.

2 Our second contributing cause was that the NRC
3 did not have reporting requirements in place to collect
4 information about deliberate acts to assess their
5 frequency.

6 One of the things I learned since the last
7 time I was here and gave the exit interview was that there
8 were many more of these kinds of events than I personally
9 had been aware of and that most people in the NRC were
10 aware of, and we have a section in the report that goes
11 through these precursor events.

12 But there had been some very similar events
13 and some with much larger consequences than the event that
14 occurred at MIT, and because we did not have a reporting
15 requirement for deliberate acts, these were not being
16 captured in a consistent manner, and some of them weren't
17 being captured at all because there was not a requirement
18 for reporting.

19 We learned of some of them through meetings
20 that were being held about the same time as the IIT was
21 progressing.

22 And the third contribution cause was that the
23 NRC did not disseminate information about known precursor
24 events and did not inform licensees of the circumstances
25 of a similar incident at the National Institute of Health

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 until four months after the incident was reported.

2 Again, we're not saying that simply getting
3 this information out would prevent deliberate acts, but we
4 think that if we expect licensees to be evaluating their
5 own programs, developing their own deterrents to this kind
6 of activity, that there was a burden on the NRC to get
7 what we did know out and to get it out promptly.

8 As Dr. Ross mentioned, we will be providing
9 suggested actions based on these conclusions to the
10 Executive Director for Operations, and he will determine
11 which of those to send forward to the program offices who
12 have responsibility for implementing any changes that come
13 out of here.

14 At this point, I've discussed the findings and
15 conclusions, and I'd ask MIT if they have any response at
16 this time to make.

17 MR. LITSER: Thank you, Dr. Glenn, Dr. Ross.

18 I don't have a lot to say. I have a few
19 things I would like to say. First of all, I think both,
20 we and the individual who ingested the Phosphorous 32,
21 will be pleased to know that there are apparently no
22 health consequences of this and that's been one of our
23 primary concerns, and I'm sure his as well.

24 I think, too, that in their response to this
25 incident, our Radiation Protection Office really performed

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 admirably, and I would like to compliment them publicly on
2 their having done so.

3 I think there are a number of things for us
4 all to learn here. I think our procedures certainly have
5 not been as stringent or strict as perhaps they ought to
6 be.

7 It's a characteristic of university
8 communities that we tend to operate in an open and
9 unfettered and, hopefully, creative way, and occasionally
10 that gets us into situations which we would rather avoid,
11 so I think we are going to have to change many of our
12 things as we do them.

13 In fact, we have already changed many in
14 response to suggestions from the NRC. I think, as you
15 said, the NRC, itself, is going to learn a few things from
16 this as well, so I think that's important.

17 When you have a chance to learn something
18 where there are no, fortunately, no serious consequences,
19 it's a good thing to take the opportunity to do that. I
20 think some of the things we can do will optimize the
21 situation, that people will still be able to carry out
22 their research, but that we will have procedures in place
23 that will tend to reduce the opportunities for incidents
24 like this in the future.

25 And I think it will also generally create a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 mental environment that people have that these materials
2 perhaps need to be treated with a great deal more respect
3 than you come to do so if you use them every day.

4 I would like to thank the Nuclear Regulatory
5 Commission for its efforts in this. I've only had a
6 chance to skim quickly through your report. It looks
7 thorough. We certainly have found that the interaction
8 with your staff and investigators has always been a very
9 positive one, and we think that you've done a good job in
10 handling all of this.

11 I don't want to be defensive about any
12 deficiencies that you may have uncovered in MIT's
13 policies. I do think we need to make sure that we're
14 dealing with the facts, and you have provided us with an
15 opportunity to correct errors of fact in the report, and
16 we shall take that opportunity.

17 Frank Masse, our Radiation Protection Officer,
18 has had a chance to study the report more thoroughly than
19 I have, and I would like to give him the opportunity to
20 make any comments he would like to make.

21 MR. MASSE: Thank you, David. Thank you,
22 John, for the report that you've presented.

23 We will, obviously, take advantage of the
24 opportunity for a written response within 30 days, and
25 it's my understanding that that written response will then

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 go with the document and become appended to the document
2 and distributed to anybody who gets the document.

3 MR. GLENN: That's correct. It will be a part
4 of the same record and will be distributed with the
5 report.

6 MR. MASSE: Okay. We think that's important
7 because we think there are some issues and some factual
8 areas that do need some correction, and we think that it
9 will help in the overall accuracy and effectiveness of all
10 of the work that you people have gone to here also.

11 We're very pleased, obviously, that the
12 agreement on the dosimetry is as tight as it is. We
13 certainly put a great deal of effort into that, and I'm
14 very proud of my team for all of the work that they went
15 to here, and we're gratified to see that Oak Ridge and
16 Lawrence Livermore agreed with our results.

17 We're a little puzzled by the range that was
18 adopted by the team. Everybody agreed between 550 and 570
19 as a quantity of intake, and yet the team put a range of
20 500 to 700. You know, I wonder about the justification --
21 500 to 750. I wonder about the scientific justification
22 or technical justification of a range that is three or
23 four times higher on the up side than it is on the down
24 side of the agreed upon number, but we'll address that in
25 the written response.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVENUE, N.W.
WASHINGTON, D.C. 20005

1 I'll go through this thing sort of piece by
2 piece because I think that may be the most helpful way to
3 do it, and as I said, we'll all put it in writing later.

4 We're still very much puzzled by many aspects
5 of this entire incident, but one of your, or two of your,
6 findings I find to be very much in conflict.

7 As I go through the report, I see that you
8 have concluded that in all probability the intake occurred
9 as he ate his lunch on Monday with a lunch that had been
10 carried over from the previous day, left in the
11 refrigerator in the laboratory from the previous day.

12 Yet, when he surveyed out his laboratory work
13 at 7:00 p.m. that day, he surveyed successfully without
14 any increase in background. We just don't think that's
15 possible.

16 Based on our experience, which probably is the
17 most experience anybody has in the world at this stage in
18 the game on an issue like this, we do not think it's
19 possible that he could have had a half a millicurie of P-
20 32 in him at 7:00 p.m. that evening and surveyed himself
21 out of the laboratory successfully, and so we would raise
22 that factual question very seriously. We think that's
23 likely to be a problem.

24 With respect to the whole-body counter, the
25 work that was going on between my team and the researcher

1 involved in the early stages of this investigation was
2 very much of a cooperative effort, and he was a five year
3 post doc, a very responsible, very knowledgeable
4 researcher, and we let him, and in fact invited him, to
5 sit in with us as we considered what we were doing with
6 respect to the best approach to the measurements and that
7 sort of thing.

8 The calibration of the whole-body counter for
9 P-32 is something that had to be done specifically for
10 this incident. I had done work with P-32 and with
11 strontium 90 many years ago shortly after I developed this
12 whole-body counting system, and I knew what the ups and
13 downs of trying to count pure beta emitters and the whole-
14 body counter are, but the rest of the team did not.

15 So, we were discussing that sort of thing, and
16 the question came up about the overall geometry, and it
17 was I that pointed out that we need to correct for the
18 geometry and I that pointed out that the 65 percent factor
19 that needed to be included here went back to the original
20 literature that was published back in the seventies on
21 this and correct this.

22 It was really part of our process at that
23 stage in the game, and I don't think that we should be
24 criticized for not identifying that immediately. It was
25 not really a problem at that stage in the game, and I'll

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 point out why as I go along here, but I think that needs
2 to be noted.

3 The other is that the third party that we
4 brought in to look over our shoulder on our exercise in
5 terms of the dosimetry on this issue, the report does not
6 represent the facts with respect to how that came about.

7 First of all, the meeting at which that was
8 decided upon did not include either the direct supervisor,
9 who happened to be in Japan at the time, or the Director
10 of the Cancer Center, who happened to be in Europe at the
11 time, but the gentleman who sat in with us was the
12 Chairman of Department of Biology, who was available and
13 was part of the discussion.

14 It's correct that the researcher asked for an
15 outside opinion, but he knew of nobody who could offer
16 this opinion, and we worked out an arrangement between the
17 three of us as to who might do this.

18 I retained this individual, I paid this
19 individual, and I instructed this individual to work
20 directly with the researcher, so this was, I think the
21 record should show that we should get some credit for
22 this, and it does not the way it's written at the present
23 time.

24 There's an error in 211 of your report that
25 you may wish to address right at the very top of the page.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 You talk about 1,000 microcuries and 100 microliter
2 quantities being delivered and talk about researchers
3 usually using 10 microliter aliquots, and then you carry
4 that over as 50 microcuries, and, of course, that doesn't
5 check out.

6 It has to be at least 100 microcuries, and I
7 just thought I'd point that out. It's a minor issue, but
8 you may want to note that.

9 The next issue I'd like to talk about is the
10 initial, there's some criticism about the initial
11 assessment of the intake in the report, and this goes back
12 to interpretation of the regulations.

13 You criticized us for not being more thorough
14 in our initial intake, and that same criticism talks about
15 the error in the whole-body counter fraction.

16 My interpretation of the regulations, as I've
17 indicated to you throughout this investigation, was that
18 there are three levels of reporting requirement.

19 The first is if it's clear that the ultimate
20 dose will exceed 25 rem, there's a 24 hour reporting
21 requirement; the second is that if there's an indication
22 that there will be an exposure in excess of 5 rem in 24
23 hours, there is a 24 hour reporting requirement; the third
24 category is that if the exposure is likely to or threatens
25 to exceed 5 rem, then there is a 30 day reporting

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 requirement.

2 Okay. Now, our initial action on the night of
3 the recognition of this event was more than adequate to
4 show that we certainly could not get to 25 rem and that we
5 could not get to 5 rem in 24 hours, and once we had gotten
6 to that point, then we knew we had 30 days to work with
7 the data.

8 So, I did not see any reason for any immediate
9 haste or any excessive effort. I felt there was plenty of
10 time to slowly, carefully and deliberately do our work
11 here, which is exactly what we did, and we had 30 days to
12 report if, in fact, it ever appeared that we had a
13 reportable incident.

14 You talk in the report about the fact that we
15 several times had indications that there might be a
16 threat. We still had that 30 days to think about that,
17 and I think that's the way the regulations are written,
18 and if that's not the way it was intended that they be
19 used, then they should be changed, but the guidance we
20 have and the regulations that we have to work with clearly
21 indicated that we had plenty of time to work this through.

22 Now, we did have numbers from the researcher,
23 but the numbers from the researcher, we had plenty of time
24 to review those. They never stood the light of day when
25 you worked with them.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 He either would be working with a peak from
2 urinary peak concentration from his excretion or he would
3 be combining urine collected on two different days to get
4 to a high number or we didn't get any support at all for
5 the number that he gave us. It was just a number with no
6 technical backing. We had to go by our own data, and we
7 had to go by our own measurements.

8 If, in fact, any of these had turned out to be
9 valid, as we worked through very carefully on all these
10 measurements, then, of course, we would have reported
11 them, but we never ever, in any slow, careful,
12 deliberative process felt that we had in excess of a 600
13 microcurie intake, and I think we should be credited with
14 that.

15 I think that's the way the system should work,
16 and I interpret that 30 day reporting requirement as
17 deliberately installed to give us time to work the data
18 and be sure of what we're doing, and that's exactly what
19 we did.

20 With respect to your root cause analysis --
21 before I get to that, let me talk about the committee
22 issues. We just had an inspection earlier this week, as
23 you know, to close out the inspection for earlier this
24 year and to look at our security response.

25 There are errors in your report with respect

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 to the findings on the earlier inspection. You indicate
2 that the Committee only held three meetings in 1993 and
3 1994. In fact, there were seven meetings held in that two
4 year period.

5 We could not get a quorum in December of 1993.
6 We had to carry the meeting over to 1994, and then that
7 meeting in January of 1994 was erroneously counted as
8 satisfying the 1993 and the 1994 meeting requirements.

9 If we had cut that meeting in half and closed
10 one and started another, we would have met all of your
11 requirements. We didn't do that. Okay? But the records
12 should show, and in our response to that, we said that
13 part of our difficulty in meeting our quorum requirements
14 is that we have very senior, very experienced people as
15 members of the Committee.

16 One answer to that, if it's important to the
17 NRC that the calendar timing be the primary issue here, is
18 that we can just go to less senior members of the faculty
19 as members of the Committee and then always meet our
20 quorum requirements because they, obviously, will have
21 less busy schedules than the more senior people that we
22 have now.

23 It's a question of which is more important, it
24 seems to me, and that's one of the things we need still
25 need to look at.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 With respect to the note in the report that
2 the Committee was not notified, indeed, not only the
3 Committee Chairman, but all of senior management here at
4 MIT were notified as soon as I made the decision to close
5 down radioactive material access to the laboratory in
6 question.

7 It was in August, as you realize, and there
8 was no possibility of pulling together a quorum of the
9 Committee, and as soon as we could get a quorum of the
10 Committee together, we did early in September, but not
11 only the Chairman, but other members of the Committee were
12 aware of what was going on and were aware that we were
13 working with the data here.

14 So, I think that is not accurately reflected
15 in your report, and it is something that we ought to look
16 at.

17 With respect to the root cause analysis, I
18 think the first item there, MIT program for controlling
19 security radioactive materials was not effective to deter
20 or detect diversion of radioactive materials, probably
21 applies to every program in this country, and it probably
22 applies to every program in this country because the NRC
23 simply has not pushed us in that direction in the past.

24 I see the standard that we're being held to
25 now as an entirely new standard. We'll meet it. I think

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 we've already shown you that we will cooperate and do
2 whatever we have to, to satisfy the need, but I think we
3 should all be honest about the fact that this is really a
4 new standard and that a lot of people are going to have
5 difficulty meeting it and working with it.

6 I think we all also have to recognize that
7 it's not going to prevent what happened here, in all
8 probability, and, you know, it's kind of a side issue.

9 The day that we met, after the weekend when
10 you found that you could get into the laboratories that we
11 thought were secure, we discussed this.

12 We just don't do our inspections at midnight
13 on Saturday night. I mean, I don't know of anybody that
14 does. We will now, and we have since, as you know, but
15 this is just something that we hadn't considered a
16 necessity in the past, and it is very much a different
17 standard than anything we've faced before.

18 But if you recall our discussion the morning
19 after, you know, I asked if you thought it had anything to
20 do with this particular incident, and the agreement of
21 everybody there was that probably not, that nobody really
22 felt, in fact, your conclusion is that this was the
23 knowledgeable act or the deliberate act of a knowledgeable
24 person.

25 Nobody believes that anybody walked in from

1 Main Street and caused this, and so the security access
2 issues here are something of a side line, and, you know,
3 it's something that we can, obviously, address, but it's
4 something of a side line on this particular issue, and I
5 think we should all be honest about that.

6 I have to note that, in the past decades,
7 there have been no citations by NRC of any questions of
8 security or access to materials in any of our programs. I
9 also have to note that the deficiencies in our statements
10 and the required procedures and so forth, those required
11 procedures were all reviewed by NRC in our licensing
12 actions, and nobody raised any questions on them.

13 As you've indicated in your own guidance,
14 there was no clear indication of what you were looking for
15 in security, so I think it has to be emphasized that this
16 is a new standard, and we will meet it.

17 Others will be way behind us because they're
18 not under the gun, as we are in terms of meeting this, but
19 it should be clearly stated that this is something new,
20 and I think that if, in fact, security and access to
21 materials and so forth does play a role in this particular
22 issue or the issue at NIH, then NRC has to share in the
23 responsibility here.

24 Thank you.

25 MR. GLENN: I won't respond point on point,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 but I will take note in terms of your last comments, and I
2 think if you look at the report in toto, you will see
3 that, in fact, the team did come to the conclusion that
4 the NRC bears a responsibility to look at its regulations
5 to make sure that our expectations are clearly stated,
6 that the guidance we issue is clear in this area and that
7 we revisit just exactly what that standard should be.

8 MR. MASSE: Okay. Very good. Thank you.

9 MR. ROSS: I have one question. I was busy
10 taking notes. Of course, we'll have the transcript. I
11 did have one request in your response.

12 When you were discussing your interpretation
13 of reporting requirements, if you would make it clear in
14 your response whether MIT regarded this as a 30 day
15 notification. I couldn't tell from what you were saying,
16 so if you'd make that--

17 MR. MASSE: Yes, very definitely we regard it
18 as a 30 day notification.

19 MR. ROSS: Okay.

20 MR. MASSE: And--

21 MR. ROSS: That's good.

22 MR. GLENN: I believe that will close the
23 formal part in terms of the interaction between the NRC
24 and MIT--

25 MR. MASSE: Can I make one more point?

1 There's another thing, there's a theme in the report that
2 is not consistent with our earlier conversations. Okay?

3 A decision was never made not to report. I
4 think I made that point before. The way I make my
5 decisions is they're always positive decisions. Okay? We
6 kept watching to see if there was a requirement to report.
7 We never made a decision not to report.

8 There's a subtle different there that's
9 important. Okay? And the way we went through it, Dr.
10 Ross, was to go through a process of elimination. Was
11 there the possibility of a 25 rem dose? The answer was
12 no. That was clear.

13 The next category is, Was there a possibility
14 of a 5 rem dose in a 24 hour period? In my opinion, that
15 being my interpretation of that segment of the
16 regulations, the answer was no.

17 Now, we were down to the last reporting
18 requirement which would have been the possibility at some
19 point of considering a 30 day report. Okay?

20 MR. ROSS: Okay.

21 MR. MASSE: If, and I looked at, very
22 carefully, at the interim category, whether or not we
23 should be looking at committed versus effective dose in
24 terms of the interim category for reporting.

25 The reason I finally looked at it in terms of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 the actual words in the regulation and considered it as
2 effective dose is because if it were committed dose that
3 was intended there, then your 50 page of allies in your
4 report, in your regulations, would have actually had two
5 conflicting reporting requirements.

6 If you considered it as a committed dose, then
7 any time you had an ally, you had both a 24 hour and a 30
8 day reporting requirement. Now, which was it? The only
9 way I could interpret it that made any sense was as the
10 actual effective dose at 24 hours and, therefore, we were
11 down to a 30 day report.

12 MR. GLENN: Okay. At this point, we'll accept
13 questions from the audience. I would ask that anyone who
14 has a question come up to the microphone, identify who you
15 are and who you represent and then ask your question, and
16 we'll try to respond to it.

17 MR. ROSS: Before you get into it, we do have
18 several other NRC people. Depending on your question, we
19 might draft them out of the audience and get them to
20 answer.

21 MR. ROUSH: Thank you.

22 I'm Wade Roush from Science Magazine, and I
23 write in the News Department. I have several questions,
24 and it looks like I'm the only person who does, so--

25 UNKNOWN: No, there's someone there.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. ROUSH: All right. So, I'm not going to
2 hog the microphone, but the first was about the ingestion
3 itself. Dr. Glenn, you've stated in your summary that the
4 amount of material ingested was not sufficient to cause
5 clinical symptoms or acute affects.

6 This is more of a question about medicine and
7 radiology, but is anything known about the possible
8 chronic effects of this level of exposure?

9 MR. GLENN: This level of exposure would be in
10 the same range as normal occupational exposures, and so
11 there is risk associated with low level exposure.

12 I guess putting this in terms of things people
13 might understand, I think the exposure is equivalent to
14 approximately two CAT scans.

15 MR. ROUSH: Okay. My other questions are
16 really about the discussions you've been having just here
17 at the end of the session having to do with reporting
18 requirements.

19 NRC issued a notice to licensees at the end of
20 October that in general terms described the incidents here
21 at MIT and at NIH without mentioning the names of the
22 licensees and issued what were called guidances or pieces
23 of advice about how certain parts of the regulations on
24 reporting should be interpreted.

25 The gist of that notice was that there was a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 requirement to report an incident in which deliberate
2 misuse of activity was suspected, but what you've just
3 said in your presentation was that there was no such
4 regulation in place, and I wonder whether this is an
5 example of another contradiction between existing
6 regulations and interpretations of the regulations and
7 whether part of your follow-up action will be to clarify
8 such contradictions.

9 MR. GLENN: Certainly the actions are to take
10 a look at the need for -- if we expect deliberate action
11 to be reported, should we have explicit words that say
12 that.

13 MR. ROUSH: So that will be part of the
14 analysis--

15 MR. GLENN: That will be part of the actions
16 that are recommended as a result of the team's
17 conclusions.

18 MR. ROUSH: My last question is about the
19 interpretation of the intent of the 30 day period of an
20 exposure of less than 5 rem in 24 hours is suspected.

21 Dr. Masse gave his interpretation of the
22 meaning of that 30 day period. He said that he thought it
23 was to give the licensee time to do a deliberate
24 investigation and report if and when necessary.

25 I wonder what the NRC's response to that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 interpretation is, and then I have a follow-up question to
2 that.

3 MR. GLENN: Okay. I'll give you my
4 interpretation. When I look at the three different
5 reporting requirements, certainly the 25 is saying
6 something really bad has happened, we got to know about it
7 immediately.

8 I would say the 24 hour reporting requirement,
9 which includes the received in 24 hours, is meant to
10 indicate some sort of acute event, that the exposure is
11 not the result of a chronic problem which didn't have a
12 lot of threat associated with it, but it's something that
13 happened suddenly, didn't reach the 25 rem threshold, but
14 it's something where a person got a whole year's exposure
15 in one event within a 24 hour period and that's why I
16 think there's a group within the NRC who definitely feel
17 that an intake qualifies with that concept, so that would
18 be the 24 hour reporting.

19 Then the 30 day is any time within a year that
20 you determine that someone has gone over one of our
21 limits, then you have to do a 30 day report, but that
22 gives you time to collect all the information, the history
23 of the person, that kind of thing. So, I think the
24 crucial question comes down to this confusion over in a 24
25 hour period.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. ROUSH: I've spoken with Dr. Masse's
2 counterparts at other universities, radiation protection
3 officials who have told me that in an event comparable to
4 this, they may have gone ahead and called NRC even if they
5 didn't suspect that the exposure had been in excess of
6 600 microcuries because, if only because the NRC's
7 presence can advance an investigation, can offer a lot of
8 help to the local investigation.

9 I don't know if Dr. Masse is, whether you're
10 willing to respond to questions at this time, but I guess
11 I'd like to just put that issue on the table. Does the
12 NRC wish that some of its licensees would invite it in a
13 little sooner if only because of the help that it can
14 offer in that respect?

15 MR. GLENN: I can answer that our bias is yes,
16 we would like on close calls to have the information.

17 MR. ROUSH: Dr. Masse, do you have any comment
18 on that? I mean, it's a close call, and so you decided
19 not, you never decided not to report that you were waiting
20 to see whether to report.

21 MR. MASSE: I think working alone, we were
22 able to develop a very, very solid bit of data here that I
23 think justifies the way we operated, and I think we got
24 everything done.

25 We did everything that needed to be done. We

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 got it all wrapped up very well, all within the reporting
2 requirements and within the regulations.

3 If the regulations are changed so that there's
4 a clear reporting requirement, then, fine, we obviously
5 will do whatever the regulations call for, but we never
6 felt that we needed help. We always felt that we had
7 everything completely under control.

8 I can understand why some of my counterparts
9 elsewhere might respond the way you described. Not
10 everybody has the kind of capability that we have, and not
11 everybody can do the kinds of things that we did here, and
12 we did very successfully.

13 MR. ROUSH: Thank you.

14 MR. GLENN: Let me do just one little follow-
15 up. I think one reason why we would sort of like people
16 to err on the side of reporting is that, and Frank may be
17 quite correct that in terms of technical ability, knowing
18 what to do and that sort of thing, MIT was as qualified as
19 anyone in the world to do that.

20 However, there was a dimension to this issue,
21 the potential for a malicious act, that the NRC needed to
22 be looking at its own procedures and perhaps looking over
23 what MIT was doing as well, and so where these new
24 dimensions, perhaps things that we haven't anticipated,
25 come up, we would like to be involved as early as

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 possible.

2 MS. GOREN: Hi. My name is Jennifer Goren,
3 and I'm from WBUR radio. I just have a couple of
4 questions.

5 I'm wondering, is the investigation continuing
6 into how exactly this happened or is this the final
7 report?

8 MR. GLENN: There is an independent ongoing
9 investigation by the NRC's Office of Investigations, and
10 this report does not address any of their findings.

11 MS. GOREN: If you don't know exactly what
12 happened, how is it possible to know whether the
13 precautions, the guidelines that are in place now, are
14 adequate or are not adequate?

15 MR. GLENN: Again, we did the best we could.
16 The contributing causes, we assume that it was a
17 deliberate act. We felt that accountability and security
18 would go a long ways towards deterring and detecting such
19 events, and we've had an information notice that's gone
20 out alerting other licensees to do this, and certainly
21 here at MIT, we've monitored and determined that they have
22 upgraded their security program considerably.

23 However, the report does take note that we
24 weren't able to get to root cause because we don't know
25 exactly what did happen.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MS. GOREN: Touching on what Dr. Masse said
2 earlier, if this was done by somebody who was a
3 "knowledgeable" person, perhaps from the MIT community,
4 are there any safeguards, you know, locking anything up
5 that could prevent something like this from happening
6 again? Presumably, that person would have access if he or
7 she were in the community.

8 MR. GLENN: I think the issue of protecting
9 people from the knowledgeable person who is, in fact, the
10 expert who has the authority and the authorization to use
11 material is a very difficult issue.

12 And I think in terms of the actions that the
13 NRC will have, it's to find out what the right balance is
14 in terms of the threat and the cure, and in terms of my
15 presentation, where I was talking about the confusion
16 between the regulations and the guidance, I don't mean to
17 say that perhaps the guidance doesn't have some good
18 things in it, too.

19 Perhaps there are smaller quantities of
20 material that don't require as much surveillance, but then
21 as you move up, and you get to more significant
22 quantities, maybe there are some really stringent extra
23 requirements that will be needed.

24 So, there may not be one simple answer to how
25 you prevent deliberate acts.

1 MS. GOREN: Also, Dr. Masse mentioned that if
2 it's a problem at MIT, this is a widespread problem at
3 universities and laboratories all around the country. Can
4 you comment on that?

5 MR. GLENN: We've already sent out the
6 information notice the end of October alerting licensees
7 to this issue, and the actions that come out of here are
8 to look at our regulations and see whether the regulations
9 and the guidance are, in fact, adequate on this issue.

10 MS. GOREN: Is it the NRC's impression that
11 response to NRC guidelines is lax for attention to them,
12 not response?

13 MR. GLENN: The findings of the team are
14 particularly directed towards MIT, so I can't make a
15 generic finding with respect to other institutions, but I
16 don't challenge Mr. Masse's comment that there may be
17 similar problems elsewhere.

18 MS. GOREN: Okay. You mentioned just early on
19 that there were larger incidents, more serious incidents,
20 that occurred elsewhere. Other than the incident at NIH?

21 MR. GLENN: Yes. In Section 3 of the report,
22 there is a list of these precursor events. I'll take note
23 that there was an event in 1978 in University of
24 California, in San Francisco, that involved an intake of a
25 few millicuries, in other words, ten times the kind of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 activity we're talking about here.

2 And, in addition, there was external
3 contamination in the home which resulted in what appeared
4 to be actual radiation burns on the skin of the
5 individual, so there were precursors that had more
6 consequence than this incident.

7 MS. GOREN: And I just have two other
8 questions. One of them is I had heard from a Radiation
9 Protection Officer at another university that if it was a
10 person who was knowledgeable who did this, then that
11 person would realize that an exposure of approximately 570
12 microcuries wouldn't cause health effects or acute effects
13 and that it was more likely an attempt to scare the
14 researcher than to hurt him. Can you comment on that?

15 MR. GLENN: The team really didn't make a
16 finding on that, and, again, that probably would require
17 that we actually identify the root cause of the ingestion
18 rather than the information we have.

19 I can only speculate, and it would be nothing
20 more than speculation.

21 MS. GOREN: Okay. Do you think that the
22 investigations will ever clear up exactly what happened?

23 MR. GLENN: I hope so.

24 MS. GOREN: Okay. Thank you.

25 MR. GLENN: Thank you.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVENUE, N.W.

WASHINGTON, D.C. 20005

1 MR. ROSS: That seems to be about it.

2 MR. GLENN: Any more questions?

3 (No response.)

4 MR. GLENN: Okay. Thank you very much.

5 (Whereupon, at 11:17 a.m., December 8, 1995,
6 the above matter was concluded.)

This is to certify that the attached proceedings before the United States Nuclear Regulatory Commission in the matter of:

Name of Proceeding: FINAL EXIT OF ITT AT MIT

Docket Number: --

Place of Proceeding: Cambridge, Massachusetts

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission taken by me and, thereafter reduced to typewriting by me or under the direction of the court reporting company, and that the transcript is a true and accurate record of the foregoing proceedings.
