--	----------------------	---

## I. DESCRIPTION

<b>Software Name, Version, and Build Number:</b>	FLO-2D Pro, Build 16.06.16 Computational Engine (FLO-2D-Setup.exe) GDS Pro with VC2005-CON.dll (VC2005-CON.dll)  Storm Water Management Model (SWMM) Version 5.0.022
<b>Supplier:</b>	FLO-2D Software, Inc., P.O. Box 66 Nutrioso, AZ 85932, USA  SWMM - U.S. Environmental Protection Agency (EPA)
<b>File Date and size:</b>	FLO-2D-Setup.exe, Build 16.06.16: September 08, 2017, 878,449 kb  FLOPRO.exe: October 29, 2016, 10,516 kb  VC2005-CON.dll: October 28, 2016, 645 kb The source code is proprietary and not readily available or distributed by the originator.
<b>Software or Service Description:</b>	FLO-2D Pro is a dynamic flood routing model that simulates channel flow, unconfined overland flow and street flow. It can simulate a flood over complex topography and roughness while reporting on volume conservation – the key to accurate flood distribution.

## Summary of Conclusions

Based on the complete set of results for the manual calculations and the FLO-2D Pro calculations, the FLO-2D Pro software is determined to be accurate. The comparison of the results indicates acceptable consistency and accuracy and it is concluded that FLO-2D Pro is acceptable and accurate for its intended use in modeling a flood due to a Local Intense Precipitation (LIP) and lesser flood elevations. Testing of all critical characteristics was deemed to be acceptable, and it is concluded that the FLO-2D Pro software is acceptable and accurate.

## Non-conformances

This section describes all errors, discrepancies, or weaknesses discovered during testing or reported by the software vender and the resolution or explanation of each. The applicable features for FLO-2D were verified to be accurate and acceptable for use by comparing hand calculations and/or benchmark cases to FLO-2D functions. Known deficiencies are corrected through the use of new software builds issued by the software vender by downloading them from the vendor's website (<https://www.flo-2d.com/download/>)

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

Software error discovery and notifications will be performed in accordance with NOP-SS-1001 (Reference 10). A condition report will be initiated in accordance with NOP-LP-2001, when an error or failure is discovered (Reference 10).

### **Build 18-12-20**

The newest version of the FLO-2D Pro software as of December 26, 2019 is Build 18.12.20. Changes made to the FLO-2D software as compared to previous versions are documented in the FLO-2D document titled *Revisions, Enhancements and Bug Fixes* (Reference 9) included as Attachment 19. Reference 9 shows that several changes were made in the newest Build 18-12-20 as compared to Build 16.06.16.

### **Unresolved Issues and Work Arounds**

There are five known deficiencies involving the FLO-2D and SWMM 5.0 interaction. The deficiencies and error resolutions are shown below:

- 1) When prompted to save the "SWMMFLO.DAT" file from the Graphical User Interface (GUI), do not save the file but click "close" instead, as shown in Figure 1. The workaround is to make all edits to the "SWMMFLO.DAT" file outside of the GUI in a text editor such as notepad or wordpad. Saving the "SWMMFLO.DAT" file from the GUI corrupts the file and the model will crash immediately when attempting to run the model.

Edit Current Selection

Notes:

- i. For Drain Type 1: Width=0
- ii. For Drain Type 3:
  - Perimeter does not include curb side.
  - Area = clear flow area in grate.
  - Height = sag height.
- iii. Weir Drain Coefficients:
  - Type 1, 3, and 5: Range 2.8 to 3.2
  - Type 2: Typically 2.3
- iv. For Drain Type 4: rating table required.
  - Length=0, Width=0, Height=0, Weir Coefficients=0

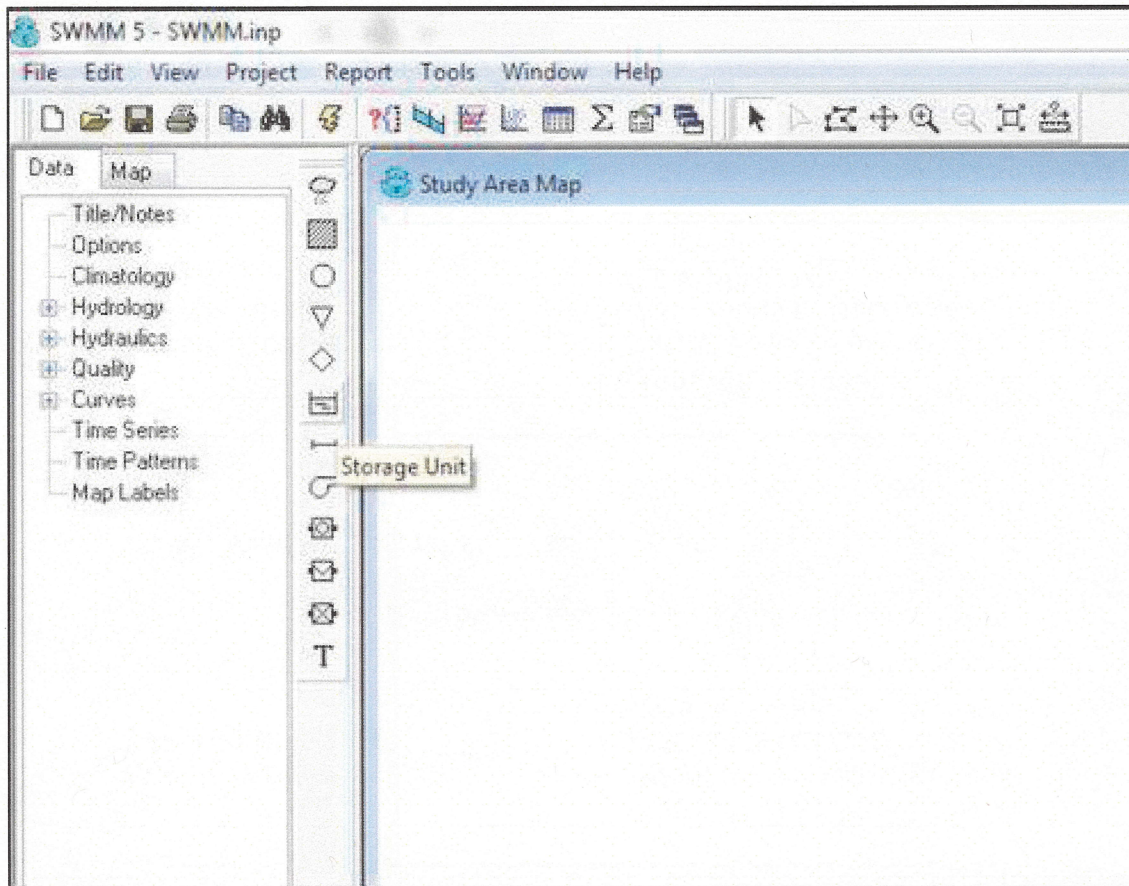

Save to SWMMFLO.DAT      Close

Figure 1: GUI to Save "SWMMFLO.DAT" File

- 2) The program will compute a NAN (Not A Number) values for volume conservation or crash completely when trying to run a model that contains grid cells with completely blocked Area Reduction Factors (ARFs) over storm drains, multiple channels, or other hydraulic features. The workaround is to ensure that no ARFs are applied over grid cells that contain these features.
- 3) Do not use storage node junctions in the SWMM interface of the program when modeling storm drains. Figure 2 illustrates how the storage node junction appears in SWMM. The storage node junction does not compute the flow correctly for flow entering or leaving the node and also affects upstream nodes. The workaround is to not use this particular function with FLO-2D.

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

**Figure 2: Storage Unit Node Location in SWMM**

- 4) In addition to checking the ".CHK" (check) files after running a model, be sure to also check the "FPRIMELEV.OUT" file after running a project with storm drains. This file lists the grid cells and elevations that were changed to match the storm drain inlets. The FLO-2D program will automatically change a grid cell elevation to match the elevation of the rim inlet of storm drain. The ground elevations of the catch basins specified on drawings will not always match exactly the ground elevation of the FLO-2D grid elements because the FLO-2D ground elevations are averaged elevations for the specified grid area. In some rare cases, the elevation data point averaging used to assign a grid cell elevation may cause the catch basin inlet rim elevation to be higher than the FLO-2D grid elevation. Therefore, in some instances, it may be necessary to adjust the catch basin depth (lower the catch basin inlet rim to match the ground elevation) to allow overland runoff to enter the storm drain system. Note that lowering the catch basin inlet in modeling space is done to more realistically represent the storm drain inlet. If left unchanged, the FLO-2D model will automatically adjust the grid cell elevation to match the rim elevation of the catch basin inlet. This will create a false high point that would limit water from entering the catch basin from the surrounding overland runoff. The catch basins with the ground elevations below the FLO-2D elevations are generally left unchanged because the catch basins are usually

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

somewhat lower compared to the surrounding area to improve hydraulic conditions of the storm drain system (i.e., sump inlet).

- 5) The 'FLOW DEPTH' output in the TIMDEP.HDF5 output file is misidentified. The 'FLOW DEPTH' parameter is the water surface elevation, not the water depth. The workaround is to subtract the cell elevation from the water surface elevation value to determine the water depth. No modification is required for the other output parameters.

### **Software Applicability Statement**

The FLO-2D Pro, Build 16.06.16 (FLO-2D) computer program is a dynamic flood routing model that simulates channel flow, unconfined overland flow, and street flow. It can simulate a flood over complex topography and roughness while reporting on volume conservation – the key to accurate flood distribution.

FLO-2D Pro's main intended use is for calculating stillwater elevations and inundation extents for a flood caused by a LIP and floods caused by lesser precipitation events.

All known deficiencies of the software have been reviewed and have no effect on the accuracy of the data created by this software. By monitoring the software provider's website, notifications of errors (bugs) and updates are evaluated for significance and resolved in accordance with NOP-SS-1001 (Reference 10).

### **Program Access/Security**

The software is maintained on a designated computer as an executable file to prevent unauthorized editing. Access to the computer is password protected to restrict access and deletion. A backup copy of the software is also maintained in a fireproof safe in the document control area.

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

## II. SOFTWARE EVALUATION

**What is the safety function of the structure, system, or component (SSC) in which this software or service will be installed or used?**

The FLO-2D Pro computer software must accurately make a determination of the potential flood water levels. Under-prediction of the maximum water surface elevation or flood duration could potentially result in some SSCs being under protected against a LIP external flooding hazard.

**What is the design function of the software or service? Describe how the software/service functions and how the software/service will impact the results.**

The FLO-2D Pro is a combined two-dimensional hydrologic and hydraulic model that is designed to simulate river overbank flows as well as unconfined flows over complex topography and variable roughness, split channel flows, mud/debris flows and urban flooding. Application of the model requires knowledge of the site, the watershed setting, goals of the study and engineering judgment.

The FLO-2D Pro computer program will be used to identify water levels and hydraulic parameters resulting from a flood caused by a LIP or any other rainfall event at areas of interest.

**What are the ways in which the software or service could fail and the effects of these failures? Will these failure modes be obvious?**

Improper performance of the software could result in errors. The errors could lead to suspect or incorrect water levels and hydraulic parameters determined by the software. These false water levels and hydraulic parameters could be reported in the calculations. The errors may not be obvious.

### **Potential Software Errors**

Conceptual Error: obtained results are incorrect/inaccurate for calculations performed within the specified range of use.

Arithmetic Error: obtained results are incorrect/inaccurate for calculations performed within the specific range of use, engineering parameters.

Interface Error: obtained results are incorrect/inaccurate when computer program is installed and interfacing with other programs, hardware or operating systems.

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

### III. SOFTWARE CRITICAL CHARACTERISTICS TESTED

**Based on the safety function(s) of the SSCs in which the software/service will be used for, what characteristics are considered critical for ensuring that the software/service will perform its intended safety function? Provide a statement of the engineering judgement used to determine the critical characteristics, and the assigned tolerance, parameter or boundary.**

FLO-2D Pro includes functions for simulation of two-dimensional overland flow, channel flow, channel floodplain interface, street flow, floodplain surface storage, area modification and flow obstructions, levees, breaching, infiltration, sediment transport (mudflow), evaporation and hydraulic structures (culverts). Functions to develop a two-dimensional grid and to simulate two-dimensional overland flow, channel flow, channel floodplain interface, floodplain surface storage, area modification and flow obstructions, levees and hydraulic structures (culverts) are tested. The GDS Pro module does not contain any critical characteristics but is necessary for execution of the FLO-2D Pro engine.

10CFR21 gives the definition of a critical characteristic as “those important design, material, and performance characteristics of a commercial grade item that, once verified, will provide reasonable assurance that the item will perform its intended safety function”. The following software critical characteristics, shown in Table 1 were tested.

**Table 1: Critical Characteristics, Acceptance Criteria, and Method(s) of Acceptance**

Number	Software Critical Characteristic	Acceptance Criteria	Acceptance Data
1	Software revision number	Verify that the Software Build 16.06.16 is during software testing	The software revision number was verified at the time of software testing and was confirmed to be FLO-2D Pro Build 16.06.16
2	Platform compatibility (operating system)	Computer program is compatible with the current operating system	Section V – Platform Compatibility
3	Hardware compatibility	Computer program is compatible with current hardware	Section V – Hardware Compatibility
4	Functions/applications 1. Overland Flow Simulation 2. Channel Flow Simulation 3. Channel-Floodplain Interface 4. Floodplain Surface Storage Area Modification and Flow Obstructions 5. Rainfall-Runoff Simulation 6. Hydraulic Structures 7. Levees 8. Green-Ampt Infiltration 9. EPA SWMM Model Interchange and Pipe Flow 10. Inflow and Outflow Elements 11. Multiple Channels 12. Section V - Test Case:  1) Test Cases 1a and 2 2) Test Cases 2 and 3 3) Test Case 2 4) Test Cases 2 and 6 5) Test Cases 2 and 6 6) Test Case 3 7) Test Case 7 8) Test Case 5 9) Test Cases 4a and 4b 10) Test Case 1a, 1b, and 3 11) Test Case 1b 12) Test Case 8

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

Number	Software Critical Characteristic	Acceptance Criteria	Acceptance Data
5	Range (input variables, limits of application)	Outputs are consistent and accurate over a range of inputs and applications	Test Cases 1 through 8
6	Accuracy	Outputs are mathematically accurate	Test Cases 1 through 8
7	Repeatability and Reproducibility	Outputs are consistent and accurate between multiple tests on the same computer. Software was installed on only one computer.	Since software is installed on only one computer, each test was run twice on the same computer to verify repeatability and reproducibility. Results were identical from two runs.

FLO-2D features that are not tested and validated are listed below. These features were not utilized in flooding calculation for Perry.

- MODFLOW Interface
- Coastal flooding
- Levee and dam failure
- Evaporation
- Sediment transport
- Mud and debris flow

Description of Critical Software Functions (Critical Characteristic #4) listed in the Table 1 are provided below.

#### 1. Overland Flow Simulation including Multiple Channel Flow

This FLO-2D Pro component simulates overland flow and computes flow depth, velocities, impact forces, static pressure, and specific energy for each grid. Predicted flow depth and velocity between grid elements represents average hydraulic flow conditions computed for a small-time step. For unconfined overland flow, FLO-2D Pro applies the equations of motion to compute the average flow velocity across a grid element boundary in eight directions one direction at a time. The eight potential flow directions are the four compass directions and the four diagonal directions. The surface storage area or flow path can be modified for obstructions including buildings. Rainfall and infiltration losses can add or subtract from the flow volume on the floodplain surface. The inflow elements provide inflow input into the model in a form of a hydrograph. The outflow elements allow flow to be removed from the model domain. The outflow elements are assigned to the area with the lowest elevations where flow is naturally discharged from the flood plain or a channel. The purpose of the multiple channel flow component is to simulate the overland flow in rills, gullies, swales rather than as overland sheet flow. Surface water is often conveyed in small channels and simulating multiple channel flow concentrates the discharge with higher depths and velocities to improve the model runoff timing.

#### 2. Channel Flow Simulation

This component simulates channel flow in one-dimension. The channel is represented by natural, rectangular or trapezoidal cross sections. Discharge between channel grid elements are defined by average flow hydraulics of velocity and depth. Flow transition between subcritical and supercritical flow is based on the average condition between two channel elements. River channel

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

flow is routed with the dynamic wave approximation of the momentum equation and it is simulated with either rectangular, trapezoidal or surveyed cross sections.

### 3. Channel Floodplain Interface

This FLO-2D Pro component exchanges channel flow with the floodplain grid elements in a separate routine after the channel, street and floodplain flow subroutines have been completed. An overbank discharge is computed when the channel conveyance capacity is exceeded. The channel-floodplain exchange is limited by the available volume in the channel or by the available storage volume on the floodplain. Flow exchange between streets and floodplain are also computed during this subroutine. The diffusive wave equation is used to compute the velocity of either the outflow from the channel or the return flow to the channel.

### 4. Floodplain Surface Storage, Area Modification and Flow Obstructions

This FLO-2D Pro component enhances detail by enabling the simulation of flow problems associated with flow obstructions or loss of flood storage. This is achieved by the application of coefficients (Area reduction factors [ARFs] and width reduction factors [WRFs]) that modify the individual grid elements surface area storage and flow width. ARFs can be used to reduce the flood volume storage on grid elements due to buildings or topography and WRFs can be assigned to any of the eight flow directions in a grid element to partially or completely obstruct flow paths in all eight directions simulating floodwalls, buildings or berms.

Limitation - In addition to ARF and WRF, raised grid cells can be used to model obstructions with a FLO-2D Pro model. Raised grid cell prevent flow from lower grid cells onto the raised cells that have elevations greater than the water surface elevations. Rainfall falling on the raised grid cells may contribute to the ground surface runoff, for example runoff from roof drain system contributing to the surface runoff. However, as a conservative approach a mild slope may be added to the raised cell so that the rainfall from the raised cell contribute to the surface runoff without any delay. This will cause higher than expected localized velocities in these lower grid cells due to difference in elevation between two cells and artificial slope introduced to the raised cell.

### 5. Rainfall-Runoff Simulation

FLO-2D Pro is a physical process model that routes rainfall-runoff and flood hydrographs over unconfined flow surfaces and/or in channels using the dynamic wave approximation to the momentum equation.

### 6. Hydraulic Structures

Generalized culvert equations for inlet and outlet control are available in the FLO-2D Pro model. Equations to compute culvert discharge for round and rectangular culverts by evaluating inlet and outlet control have been implemented in the FLO-2D Pro model. The culvert discharge will be computed using equations based on experimental and theoretical results from the U.S. Department of Transportation procedures for the Hydraulic Design of Highway Culverts; Publication Number FHWA-NHI-01-0260 revised May 2005. The equations include options for box and pipe culverts and take into account different entrance types for box culverts (wingwall flare 30 to 75 degrees, wingwall flare 90 or 15 degrees and wingwall flare 0 degrees) and three

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

entrance types for pipe culverts (square edge with headwall, socket end with headwall and socket end projecting).

#### 7. Levees

The FLO-2D Pro model's levee component confines flow on the floodplain surface by blocking one or more of the eight flow directions in a grid cell. A levee crest elevation/height can be assigned. When flow exceeds the levee height, the discharge over the levee is computed using the broad-crested weir flow equation. Weir flow occurs until the tailwater depth is 85% of the headwater depth above. Levee overtopping will not cause levee failure unless that model option is invoked.

#### 8. Green-Ampt Infiltration

Precipitation losses, abstraction (interception) and infiltration are simulated in the FLO-2D Pro model. Infiltration is simulated using the Green-Ampt infiltration method. The infiltration parameters can be assigned global or the spatial variation of infiltration over the gridsystem can be modeled by assigning unique hydraulic conductivity and soil suction values to each grid element.

#### 9. EPA SWMM Model Interchange

This FLO-2D Pro component allows the 2-dimensional surface model (FLO-2D) to be coupled with a 1-dimensional pipe model for the simulation of pressure flow within conduits. This feature relies on the VC2005-CON.dll file.

#### 10. Topography

The topographic data, representing the ground surface, are developed in ArcGIS software program, as a digital surface in the form of an ASCII (text) file. The ASCII file represents the topographical surface in the form of multiple points with x, y, and z coordinates. The ASCII file is used as an input to build a topographic surface in FLO-2D.

Note on Impact Loading and Hydrostatic Loading: The FLO-2D Pro functions to calculate Impact Loading and Hydrostatic Loading are not tested. These functions were intentionally not tested for two reasons:

1. The Hydrostatic Loading function in FLO-2D Pro makes assumptions about the structure on which loads are applied. The assumptions are that the structure is vertical and infinitely tall. These assumptions may not always apply and therefore it is best if loads are calculated outside of FLO-2D Pro, specific to the structure of interest.
2. Loads calculated with both functions are determined for the internally computed time step where loading is at a maximum. A review of the loading calculated as a time series should be performed to verify that numerical oscillations (instabilities) are not artificially influencing the maximum value. As this time series requires external calculation, it is best that the loads be calculated outside of FLO-2D Pro.

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

#### **IV. SOFTWARE TESTING METHODOLOGY AND CRITERIA**

All the applicable characteristics of the FLO-2D PRO computer program are tested consistent with the “Method 1 – Special Tests and Inspection” requirements described in EPRI Technical Report 1025243 (Reference 2).

Critical characteristics are examined using simple example problems with the comparison of results with those of hand calculations and known benchmarks. The critical characteristics related to software function were chosen by engineering judgment on the basis that they have the greatest potential impact to the intended use of the program results (determination of maximum water surface elevation and flood duration) and the boundary/tolerance assigned to each critical characteristic would not impact the intended application of the results of the model.

The platform compatibility is verified by examining the requirements of the software provided in the FLO-2D Data Input Manual (Reference 3) and comparing the software requirement to the operating system.

The hardware compatibility is verified by examining the requirements of the software provided in the FLO-2D Data Input Manual (Reference 3) and comparing the software requirement to the computer’s hardware.

The accuracy of the FLO-2D Pro Model was verified using eight test case problems:

##### **Test Case 1a and 1b**

The FLO-2D Pro software is used to simulate normal flow along a straight flume for a constant flow rate. Manning’s equation is used to determine the flow velocity. Results are compared to the hand calculated results.

Test Case 1a and 1b hand calculations are provided in Attachment 3 which calculates flow depth and velocity in a flume for comparison to FLO-2D computer model results. This test case verifies the overland flow components of the model as shown in the Input (“FPLAIN.DAT”) and Output (“DEPTH.OUT” and “VELFP.OUT”) files in Attachments 4a and 4b. This test verifies the overland flow simulation component of the model.

##### **Test Case 1 a and 1b - Acceptance Criteria**

Depth and velocity results from FLO-2D Pro must be within 5% of the hand calculated results to be considered acceptable. 5% is determined to be acceptable based on engineering judgement on the basis that a 5% change in depth or velocity in the model would not adversely affect any intended use application of the result from the model.

##### **Test Case 2**

The FLO-2D Pro software is used to recreate a flood hazard delineation project for the Truckee River in response to recorded flooding of the Truckee River through Reno and the City of Sparks, Nevada between December 31, 1996 and January 6, 1997. The FLO-2D Pro software is used to

<b>Software Name and Build: FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number: PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer</b>
---	----------------------	--

simulate a benchmarking test case using area reduction factors. The area reduction factors are evaluated to confirm that they are performing as documented in the FLO-2D Pro manual. The resulting output is compared to data available from USGS gage data along the reach.

Test Case 2 (Attachment 5 through Attachment 7) is a case study provided in Attachment 5 which calculates water surface elevation, inundation extents, and velocities for an actual watershed during a historic flood event. This test case verifies the rainfall-runoff simulation, overland flow, channel flow, channel-floodplain interface, and floodplain surface area storage area modification and flow obstruction components of the model.

#### Test Case 2 - Acceptance Criteria

Results from FLO-2D Pro must be within 10% of the peak flow rate reference data to be considered acceptable. It has been documented that USGS gage data has some inherent error in discharge readings between 5% to 10% (Reference 6), therefore, results within 10% are deemed acceptable.

#### **Test Case 3**

The FLO-2D Pro software is used to simulate flow through a culvert. The upstream end of the culvert is inundated. The estimated maximum upstream water surface elevation is compared to hand calculated results.

Test Case 3 (Attachment 8 through Attachment 10) is a simple FLO-2D Pro model with a channel and a culvert to verify the Generalized Culvert Routing routine in the model. Input files are in Attachment 9 and results from this model run are in Attachment 10. The results are compared to a hand calculation shown in Attachment 8. This test verifies the hydraulic structures and levees components of the model.

#### Test Case 3 -Acceptance Criteria

The flow depth result from FLO-2D Pro must be within 1% of the hand calculated results to be considered acceptable. 1% is determined to be acceptable based on engineering judgement on the basis that a 1% change in flow depth in the model would not adversely affect any intended use application of the result from the model.

#### **Test Case 4a and 4b**

##### Test Case 4a

The FLO-2D Pro software is used to simulate flow through a storm drain system. A simulation is run where flow is routed from FLO-2D Pro to EPA SWMM 5.0 (storm drain flow) and then back.

Test Case 4a (Attachment 11a and Attachment 11b) is a simple FLO-2D model that has been paired with a Storm Water Management Model version 5.0 (SWMM) to simulate the interaction between a storm water drainage system with overland flow. The test case demonstrates capability of FLO-2D and SWMM programs to communicate properly with each other. The input

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

files and results are shown in Attachment 11a and Attachment 11b. This test verifies 2D Floodplain to 1D EPA SWMM model Interchange.

#### Test Case 4a -Acceptance Criteria

The mass continuity error of the run must be preserved within 5%-7%. SWMM User's Manual (Reference 8) states the mass continuity errors for runoff, flow routing, and pollutant routing will be displayed in the output files. These errors represent the percent difference between initial storage + total inflow and final storage + total outflow for the entire drainage system. If they exceed some reasonable level, such as 10%, then the validity of the analysis results must be reviewed, and it may be acceptable due to difference in approach when comparing. Therefore, as a stricter criterion for testing, results within 5%-7%, are deemed acceptable.

#### Test Case 4b

The SWMM software is used to simulate flow through a storm drain system for partial and full flow pipe scenarios. Results are compared to the hand calculated results. Test Case 4b hand calculations are provided in Attachment 12b. Test Case 4b (Attachment 12a) is a simple SWMM model to simulate flow in the storm drain system. The inputs for SWMM model are listed in Section V and output files are shown in Attachment 12a. This test verifies SWMM pipe flow feature.

#### Test Case 4b -Acceptance Criteria

The flow depth result from SWMM must be within 5% of the hand calculated results to be considered acceptable. 5% is determined to be acceptable based on engineering judgement on the basis that a 5% change would not adversely affect any intended use application of the result from the model.

### **Test Case 5**

The FLO-2D Pro software is used to simulate infiltration using the Green- Ampt method. A hand calculation is performed to calculate the same infiltration test case. This test verifies the Green-Ampt infiltration component of the model.

Test Case 5 (Attachment 13 through Attachment 15) is a FLO-2D model which simulates the Green-Ampt infiltration. Input files are in Attachment 14 and results from the model run are in Attachment 15. The results are compared to a hand calculation shown in Attachment 13.

#### Test Case 5 -Acceptance Criteria

The model and hand calculated volume of infiltration must be within 10% to be considered acceptable. Ten percent (10%) is determined to be acceptable based on engineering judgement on the basis that the two-dimensional (2D) interaction by FLO-2D is much more complex than the proposed one-dimensional (1D) hand calculation for infiltration.

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

## **Test Case 6**

This test case verifies that FLO-2D Pro model can accurately transform rainfall into surface runoff (Rain feature) and appropriately represents modeling parameters such as ARF and WRF. The input files and results are shown in Attachment 16 and Attachment 17.

### Test Case 6 -Acceptance Criteria

The model and hand calculated rainfall runoff transformation must be within 1% to be considered acceptable. 1% is determined to be acceptable based on engineering judgement on the basis that a 1% change in runoff in the model would not adversely affect any intended use application of the result from the model.

ARF and WRF test cases are verified by reviewing model outputs of the grid cells where ARF, and WRF used in the FLO-2D model. ARF and WRF will be verified if FLO-2D model shows no flow in grids that are blocked with ARF and WRF.

## **Test Case 7**

This test case verifies that levee feature effectively controls flow to the top of the levee and that it allows flow to overtop. The input and output files are shown in Attachment 18b and hand calculations are shown in Attachment 18a.

### Test Case 7 -Acceptance Criteria

For levees, FLO-2D model shows accumulation in cells behind the levee and it overtops when water depth in the grid cell exceeds the height of levee.

The model and hand calculated levee overtopping must be within 5% to be considered acceptable. 5% is determined to be acceptable based on engineering judgement on the basis that a 5% change would not adversely affect any intended use application of the result from the model.

## **Test Case 8**

This test case verifies that FLO-2D Pro model can accurately assign elevations to individual grid cells in the FLO-2D Pro Model. The average elevation assigned to an individual grid by the FLO-2D model was compared to average elevation of individual elevation points in the grid cell from GIS ASCII input files.

### Test Case 8 -Acceptance Criteria

Grid elevations assigned by FLO-2D Pro model must be within 1% of the hand calculated results to be considered acceptable. 1% is determined to be acceptable to account for rounding when performing hand calculations and would not adversely affect any intended use application of the result from the model.

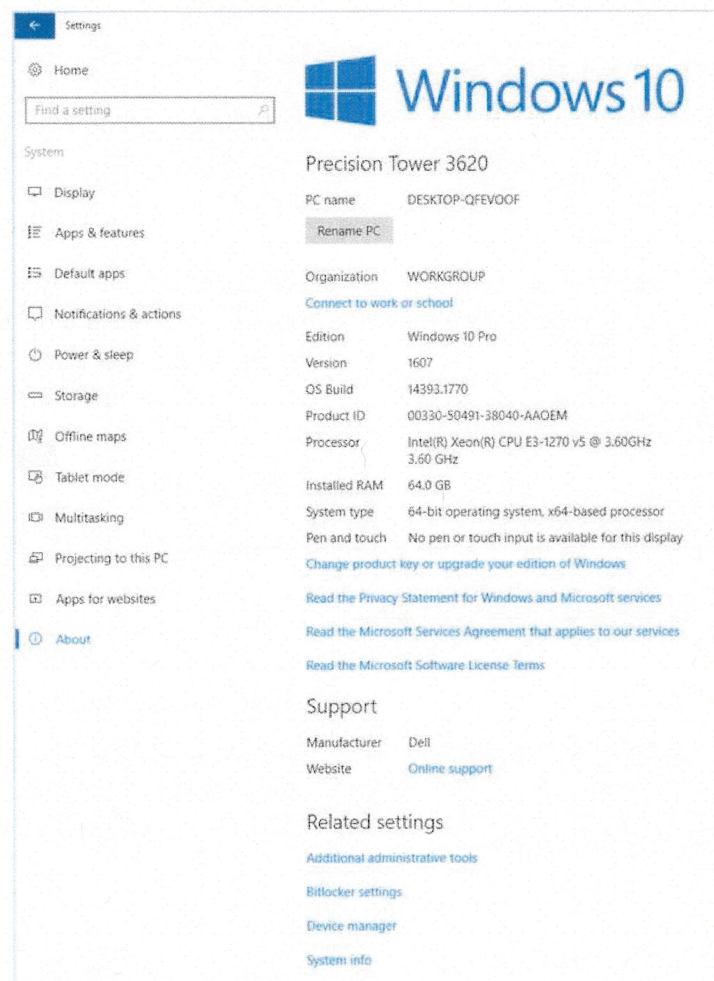

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

## V. ACCEPTANCE CRITERIA TESTS AND RESULTS

This section goes over all of the acceptance criteria tests for all of the critical characteristics listed in Section III, Table 1.

### Platform Compatibility

The FLO-2D Pro model is developed for 64-bit multi-core processor computers. It cannot be run on a 32-bit computer (Reference 3). Figure 3 illustrates the operating system installed for FLO-2D Pro Build 16.06.16 testing is a 64-bit operating system. As shown in Figure 3, the operating system meets the requirements.

**Figure 3: Computer Platform and Hardware**

Therefore, the software's critical characteristic for platform compatibility is accepted based on the acceptance criteria that the computer program is compatible with the current operating system.

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

## Hardware Compatibility

Recommended minimum computer requirements are at least 4 GB RAM (Reference 3). Figure 3 illustrates the hardware installed for FLO-2D Pro Build 16.06.16 testing has 64 GB RAM.

Therefore, the software's critical characteristic for hardware compatibility is accepted based on the acceptance criteria that the computer program is compatible with the current hardware.

## Test Case 1a – Overland Flow

### Test Case 1a (Overland Flow) Model Setup

For this test case, the method used consists of a comparison of a hand calculation solution for overland flow (Attachment 3) to FLO-2D Pro Model output data (i.e. flow depth and velocity) produced for a simple flume model (Attachment 4a). This test case verifies the overland flow component of the model and shows that the FLO-2D Pro model accurately simulates unconfined overland flow and yields an exact solution for steady, uniform overland flow.

The local intense precipitation (LIP) Calculation specifies that “... *Manning’s n-values for two-dimensional modeling differ from the Manning’s n-values for one-dimensional modeling and are not interchangeable. In a two-dimensional model, the flow resistance is represented by a composite n-value that includes consideration for bed irregularities, obstructions, vegetation, variation in channel geometry, channel expansion and contraction, potential rapidly varying flow, and variable river planform.*”. The range of n-values for 2D application were empirically derived by FLO-2D and/or others and are specified in the FLO-2D Manual. The LIP Calculation applied n-values within the prescribed ranges that has been developed from research experiments.

The inputs for both the FLO-2D Pro model and the test case hand calculation are as follows:

1. The simple flume model is 60 elements long by 4 elements wide, each element being 50 ft by 50 ft. (Resulting in a flow width of 4 x 50 ft, or 200 sq.ft);
2. A floodplain slope of 0.003;
3. A uniform Manning’s n-value (roughness coefficient) is 0.05.
4. A steady discharge of 8,000 cfs spread across four inflow nodes (2,000 cfs per inflow element) is used.

These inputs are required by the FLO-2D Pro model to estimate the flow depth and velocity within the lower reach of the flume. Three floodplain cross sections were created in FLO-2D Pro to track flow along the flume (i.e., output locations). The inputs described above are presented in Figure 4 through Figure 6. The data input files are included in Attachment 4a.

Software Name and Build: FLO-2D Pro Build 16.06.16	Software Test	RFCA Number: PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer

--	----------------------	---

**Figure 6: Grid Element Ground Surface Elevations**

### **Test Case 1a (Overland Flow) Results**

The FLO-2D results are provided in Attachment 4a. The results from the FLO-2D Pro Model output and the hand calculation are presented in Table 2.

**Table 2: Comparison of Results – Test Case 1a**

<b>Method of Computation</b>	<b>FLO-2 Pro Model</b>	<b>Hand Calculation</b>	<b>Percent Difference</b>
<b>n = 0.05</b>			
Flow Depth (ft)	6.8242	6.8	0.36%
Velocity (ft/s)	5.8959	5.9	0.07%
<b>n = 0.08</b>			
Flow Depth (ft)	9.0349	9.05	0.17%
Velocity (ft/s)	4.4901	4.42	1.56%

Using the average values reported by the FLO-2D Pro Model, the FLO-2D Pro model predicted a flow depth and velocity range within  $\pm 5\%$  of the hand calculation, excluding grid cells 237 through 240. These grid cells are outfall cells outside of the flume boundary and are excluded from the result analysis.

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

Inflow and Outflow elements are also verified by comparing the input and outflow in FLO-2D outputs at grid cells 237-240. Limitation- Flow appears with the cells without a velocity vector.

The LIP flooding model represents 2D, unsteady-state flooding simulation with the n-values selected appropriately for such simulation within the ranges specified in the FLO-2D Manual. The test model simulates a scenario equivalent to what is computed in the hand calculation (i.e. a forced replica of a 1D steady state flow pattern). This demonstrates that the number input into the program is processed in the algorithms/calculations of the software with results that can be validated. While n-values for the 1D and 2D simulations are not interchangeable and should be different for the actual model, the approach used to verify the software is appropriate since it demonstrates that the software computational processes are performed accurately.

To demonstrate repeatability of the results, the test run was performed with  $n=0.08$  and the hand calculation was done using the same n-value. As shown in Table 2, The test run results closely match the hand calculation results with the changed n-value. Therefore, accurate repeatability is confirmed.

The results of the test case meet the acceptability criteria specified in Section IV. Therefore, tested software module is determined to function correctly.

## **Test Case 1b – Multiple Channel Feature**

### **Test Case 1b (Multiple Channel) Model Setup**

The Test Case 1a model was slightly modified for the multiple channel feature verification case. The multiple channel was added along the model domain with the flow restricted using area reduction factors (ARFs) to the multiple channel. This is necessary in order to simulate conditions that are possible to verify with a hand calculation using Manning's equation. If flow is not physically restricted to the multiple channel, naturally overland flow elements will share the flow with the multiple channel elements and a steady inflow condition required for the hand calculation will be broken.

For this test case, the method used consists of a comparison of a hand calculation solution for a channel flow (Attachment 3) to FLO-2D Pro Model output data (i.e. flow depth) produced for a simple multiple channel model (Attachment 4a). This test case verifies the multiple channel flow component of the model and shows that the FLO-2D Pro model accurately simulates channel flow and yields an exact solution for steady, uniform channel flow.

The inputs for both the FLO-2D Pro model and the test case hand calculation are as follows:

1. The simple flume model is 60 elements long by 4 elements wide, each element being 50 ft by 50 ft. (Resulting in a flow width of 4 x 50 ft, or 200 sq.ft);
2. A floodplain slope of 0.003;
3. A multiple channel is set to 5 ft wide;

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

4. A Manning's n-value (roughness coefficient) is 0.05 for the multiple channel elements and 0.1 for the rest of the model.
5. A single inflow element with a steady discharge of 10 cfs is used.

Two floodplain cross sections were used to track flow along the flume (i.e., output locations). The inputs described above are presented in Figure 7. The data input files are included in Attachment 4b.

**Figure 7: Test Case 1b (Multiple Channel) Model Representation**

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

### **Test Case 1b (Multiple Channel) Results**

The FLO-2D results are provided in Attachment 4b. The results from the FLO-2D Pro Model output and the hand calculation are presented in Table 3.

**Table 3: Comparison of Results – Test Case 1b**

<b>Method of Computation</b>	<b>FLO-2 Pro Model (Cross Section 1, grid #78)</b>	<b>Hand Calculation</b>	<b>Percent Difference</b>
Flow Depth (ft)	1.30	1.34	3.03 %
Velocity (ft/sec)	1.54	1.48	3.97 %

Using the average values reported by the FLO-2D Pro Model, the FLO-2D Pro model predicted a flow depth range within  $\pm 5\%$  of the hand calculation.

The results of the test case meet the acceptability criteria specified in Section IV. Therefore, tested software module is determined to function correctly.

### **Limitations for the multiple channel feature.**

This feature must be used with careful consideration of the actual conditions. Multiple channels are used to simulate rill and gully flow, usually in a desert environment but also can be used to simulate concentrated flow in urban development. Typically, multiple channels are 3 to 5 ft wide with flow depth generally under 3 ft. Once the flow gets into a rill and gully channel that typical on a desert alluvial fan, the multiple channel will widen when the flow reaches bankfull. There is not much sheet flow on desert environments, which is the intent in creating this component. The feature could be used to also represent urban flow scenarios, but care should be exercised to represent the actual site conditions as close as reasonably possible. Additionally, minor instabilities could be observed at the multiple channel elements. Therefore, the multiple channel elements should be checked for volume conservation errors and unusually high velocities at the end of the simulation

## **Test Case 2 – Truckee River Overland Flow Case Study**

### **Test Case 2 (Truckee River Overland Flow Case) Model Setup**

The FLO-2D model used in the Truckee River Case Study (Truckee River FLO-2D Model) presented in Attachment 5 is one of the benchmark models used by the software vendor for verifying the overland flow, channel flow, flood channel interface, and floodplain storage area modification and flow obstruction components of the model. The Truckee River FLO-2D model was originally created and calibrated by a third-party engineering firm (TetraTech, Inc.) using FLO-2D Version 2009.06 to conduct a flood hazard delineation project for the Truckee River in response to recorded flooding of the Truckee River through Reno and the City of Sparks, Nevada

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

between December 31, 1996 and January 6, 1997. The model simulates 15 miles of the Truckee River as shown in Figure 8.

This model is included in the FLO-2D software package as a sample project when purchased from the software vendor. The FLO-2D input data are included in Attachment 5.

The U.S. Environmental Protection Agency (EPA) (Attachment 1) and the Flood Control District of Maricopa County Arizona (Attachment 2) have performed additional verification test cases for both the SWMM program and the FLO-2D program, respectively, which are detailed more extensively than the test cases presented in this Test Report. The program user is encouraged to review these verification and quality assurance reports for a better understanding of the specific program functions that may not be detailed fully in program user manuals or this Test Report

**Figure 8: Google Earth Image of Sparks Truckee Meadows Area**

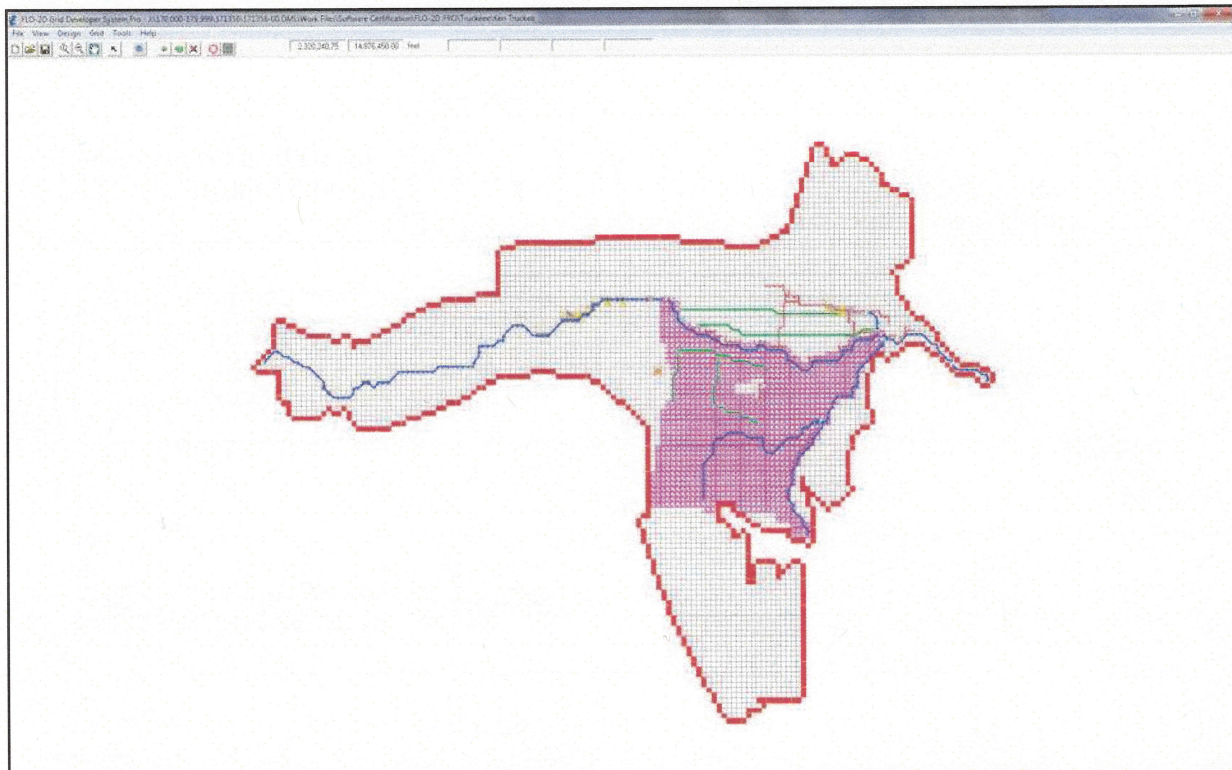

Two U.S. Geological Survey (USGS) stream gages, Vista gage (USGS 10350000 Truckee River at Vista, NV) and Reno gage (USGS 10348000 Truckee River at Reno, NV) are located along the reach of the river included in the model. The New Vista gage is located at the downstream end of the simulated reach. The New Vista gage includes almost all of the return flow from the overbank discharge in the Truckee Meadows area. The Reno gage is located upstream of the Truckee Meadows area. Data for the calibration of the model by others included recorded flood

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

stages and discharges from the aforementioned USGS gages and numerous surveyed high-water marks through the inundated area (Attachment 6).

The FLO-2D model is shown in Figure 9.

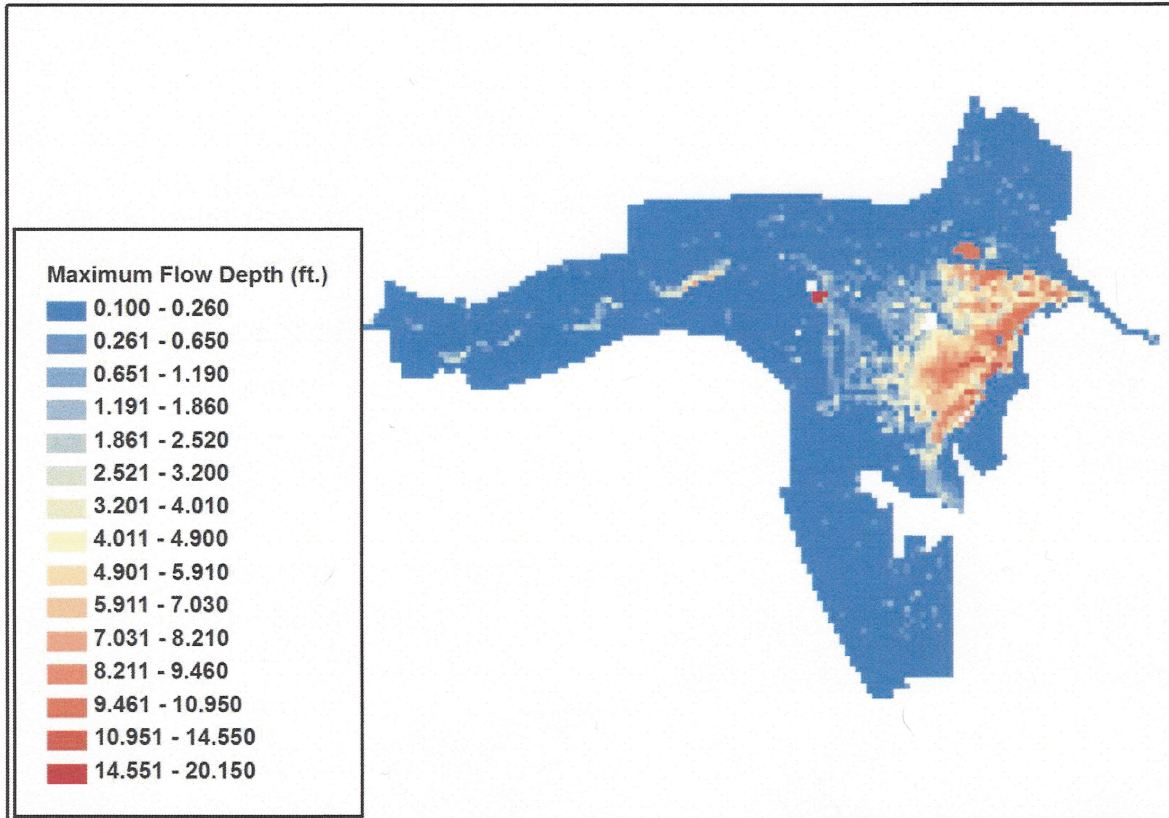

**Figure 9: Truckee River Model Representation**

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

### **Test Case 2 (Truckee River Overland Flow Case) Results**

The maximum inundated area and depth of flow are presented in Figure 10.

**Figure 10: Maximum Depth of Flow**

A review of the model calculation mass balance is presented in Table 4, originally from the "SUMMARY.OUT" file. The mass balance ensures that the hydraulic calculations are accurately conserving the volume of water in all routing calculations. FLO-2D recommends a maximum acceptable continuity error of 2%. A review of the Truckee model results suggests the maximum continuity error is within this acceptable range, and therefore the model is accurately solving the flow equations and conserving mass.

**Table 4: Comparison of Results – Test Case 2**

Total Inflow (acre-ft.)	175282.673
Total Outflow and Storage (acre-ft.)	175282.672
Maximum Inundated Area (acres)	20941.385
Maximum Wetted Channel Area (acres)	654.355
Maximum Continuity Error (%)	0.00

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

A comparison of the predicted discharge hydrograph resulting from the Truckee River model run using FLO-2D Pro at the Vista gage location (grid cell 4969) and the actual recorded USGS data at the Vista gage are shown in Figure 11. The data from the flow comparison of the USGS Vista gage and FLO-2D Pro gage location (grid cell 4969) is in Attachment 6. The output file containing the flow at the Vista gage location (grid cell 4969) from the FLO-2D model is in Attachment 7.

**Figure 11: FLO-2D Pro Predicated Discharge for the 1997 Flood at Vista Gage**

The simulated discharge at the Vista gage shows that FLO-2D Pro is accurately predicting the channel – floodplain flow interchange. The channel conveyance at the gage is less than half the observed peak flow during the early January 1997 floods. Most of the flood hydrograph is therefore conveyed over the floodplain. In order for the model to accurately predict the discharge at the Vista gage, it has to accurately predict the volume of overbank flow, channel flood routing, the overland flood routing and channel-floodplain exchange.

The maximum discharge of the Vista gage (USGS 10350000) occurs on time step 88 at 1/2/1997 16:00, at a flow of 18,500 cfs. The corresponding flow from the FLO-2D Pro model at the Vista gage location (grid cell 4969) at a flow of 19,826.88 cfs. The results also show that FLO-2D Pro is accurately predicting the contribution of rainfall to the total runoff within 10%.

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

The results of the test case meet the acceptability criteria specified in Section IV. Therefore, tested software modules are determined to function correctly.

### **Test Case 3 – Culvert Routing Hand Calculation**

#### **Test Case 3 (Culvert Routing) Model Setup**

For this test case, the method used consists of a comparison of a hand calculation solution for culvert routing presented in Attachment 8 to FLO-2D Pro output data (i.e. flow and flow depth) produced for a simple model with a channel and a culvert. The hand calculation solution is based on the Federal Highway Administration Publication No. FHWA-NHI-01-020, Hydraulic Design Series Number 5 – Hydraulic Design of Highway Culverts (Reference 6). This test case verifies the generalized culvert routing routine of the model and shows that FLO-2D Pro accurately simulates the headwater elevation for a given flow through a culvert.

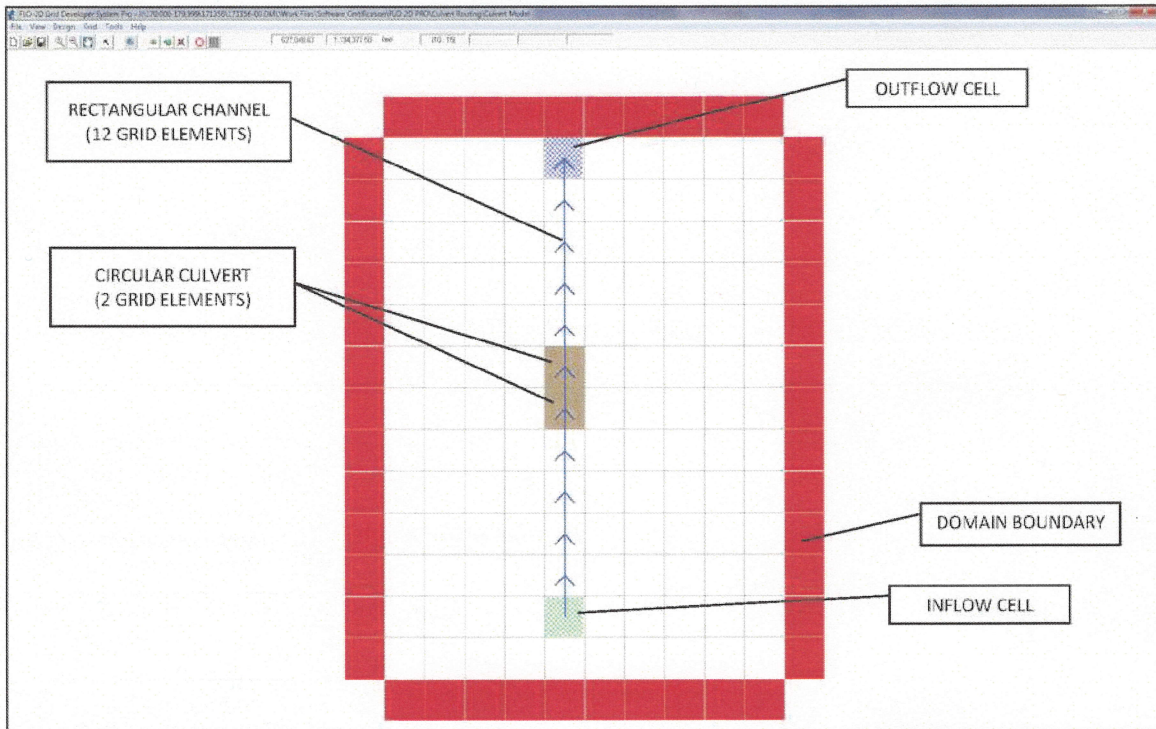

The model inputs are as follows:

1. System and numerical stability control files (Attachment 9, "CONT.DAT" and "TOLER.DAT");
2. File for Images, shape files and polylines to project when open (Attachment 9, "SUPPLEMENT.DAT");
3. The model was 13 grid elements long by 10 grid elements wide (130 total grid elements) with each element having dimensions of 50 feet by 50 feet (Attachment 9, "FPLAIN.DAT", "CADPTS.DAT");
4. A 600-foot-long rectangular channel having dimensions of 6 feet wide and 5 feet deep (12 grid elements) (Attachment 9, "CHAN.DAT" and "CHANBANK.DAT");
5. A uniform Manning's roughness coefficient n-value for both the floodplain and channel was arbitrarily set at 0.04 for the 130 elements (Attachment 9, "MANNINGS\_N.DAT");
6. A channel slope of 0.018 (Attachment 9, "TOPO.DAT");
7. A 100-foot long, 3-foot diameter (2 grid elements) circular culvert (Attachment 9, "HYDSTRUC.DAT");
8. The culvert entrance loss ( $k_e$ ) of 0.9 (Attachment 9, "HYDSTRUC.DAT");
9. A culvert Manning's n roughness coefficient of 0.024 (Attachment 9, "HYSTRUC.DAT");
10. An inflow unsteady discharge with a peak flow rate of 50 cfs (Attachment 9, "INFLOW.DAT") and outflow hydrograph (Attachment 9, "OUTFLOW.DAT").

The inputs described above are presented in Figure 12 through Figure 15.

**Table 5: Comparison of Results – Test Case 3**

Method of Computation	FLO-2D Pro Model (Grid Cell 59)	Hand Calculation	Percent Difference
Flow Depth (ft)	4.62	4.65	0.65%

FLO-2D Pro calculated a maximum flow depth of 4.6178 ft for the grid cell 59 (Attachment 10, "DEPTH.OUT"). The results show that FLO-2D Pro is accurately predicting the flow depth within 1% (consistent with Acceptance Criteria listed in Section IV of this report), as shown in Table 5.

The results of the test case meet the acceptability criteria specified in Section IV. Therefore, tested software modules are determined to function correctly.

## **Test Cases 4a and 4b – FLO-2D and SWMM Interfacing including Pipe Flow**

### **Test Case 4a (FLO-2D and SWMM Interfacing) Model Setup**

The purpose of this test is to verify that the pairing of a SWMM drainage system with a FLO-2D model overland flow would correctly export from the FLO-2D model and import to the SWMM drainage system and vice versa. To verify the FLO-2D and SWMM interface works correctly a simple volume conservation test was undertaken. A FLO-2D model was set up with two inlets that drain into a simple storm drain system with single outflow. These inlets are encased by cells of higher elevation ensuring that all water flows into each inlet. Also located inside the walls are cells with a given inflow hydrograph. For a visual of the FLO-2D model see Figure 16.

Along with verifying the conservation of volume, the actual flow (time series) from FLO-2D into SWMM needs to be verified. Within the FLO-2D manual, equations are provided to calculate flow into any of the user defined inlets. A two-step check is performed to verify that FLO-2D calculates the correct inlet flow based on the user manual equations and that the time series of inlet flow is correctly transferred to the SWMM model. Based on the time series of flow depth at the cells where the inlets are located, flow into the inlets are hand calculated and compared to the “SWMMQIN.OUT” file that is generated by FLO-2D. This comparison verifies that FLO-2D calculates the inlet flow correctly. The “SWMMQIN.OUT” file’s time series is compared to that of the time series data generated in the “SWMM.RPT” file. This comparison verifies that the correct flow rates are being transferred between FLO-2D and SWMM.

The model inputs are as follows:

1. System and numerical stability control files (Attachment 11a, “CONT.DAT” and “TOLER.DAT”);
2. File for Images, shape files and polylines to project when open (Attachment 11a, “SUPPLEMENT.DAT”);
3. The model consists of a rectangular shape comprising of 5,216 10-ft-square grid elements (Attachment 11a, “FPLAIN.DAT”, “CADPTS.DAT” and TOPO.DAT”) with one containment area of low elevation that water drains into;
4. A uniform Manning’s roughness coefficient n-value for the model was arbitrarily set at 0.040 for the 5,216 elements (Attachment 11a, “MANNINGS\_N.DAT”);
5. The outlet area is represented with an Area Reduction Factor (ARF) area (Attachment 11a, “ARF.DAT”);
6. Inflow and outflow hydrographs (Attachment 11a, “INFLOW.DAT” and “OUTFLOW.DAT”);
7. Hydraulic structures around the inlets (Attachment 11a, “LEVEE.DAT”);
8. Rainfall in FLO-2D (Attachment 11, “RAIN.DAT”);
9. Inlet parameters for storm drain inlet (open grate inlets) and weir coefficient (3.0) for FLO-2D and SWMM interface (Attachment 11a, “SWMMFLO.DAT”);
10. Lists outfall names and positions in FLO-2D that correspond to SWMM (Attachment 11a, “SWMMOUTF.DAT”);

### Test Case 4a (FLO-2D and SWMM Interfacing) Results

Based on the results (Attachment 11b, "SUMMARY.OUT") shown in Figure 20, 2.645 acre-ft of water entered the FLO-2D model through the two designated inflow cells shown in yellow. The 2.645 acre-ft of water then entered into the SWMM drainage system shown in blue in Figure 20. The 2.643 acre-ft of water then re-entered the FLO-2D model at the SWMM outfall shown in green in Figure 20.

**Figure 20: Portion of FLO-2D "SUMMARY.OUT" Results**

Figure 21 shows the final flow depths for each cell in the FLO-2D model. Based on the SWMM drainage system depicted in Figure 17, it can be concluded that all the water has been transported through the SWMM drainage system and properly discharged into its intended area.

Software Name and Build: FLO-2D Pro Build 16.06.16	Software Test	RFCA Number: PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
---	---------------	--

**Figure 21: FLO-2D Final Flow Depths**

Attachment 11b includes the discharge hydrograph into each storm drain inlet of the pipe network ("SWMMQIN.OUT"), depth of flow time series for grid cell 2486 in FLO-2D/Junction 1 in SWMM ("swmm.RPT") and HandvFLO2D.xlsx files. Using the FLO-2D calculated depths from the "swmm.RPT" file for Junction 1, inlet flow values are hand calculated. These hand calculated flow values are then compared to the inlet flow values reported in the "SWMMQIN.OUT" file generated by FLO-2D. Figure 22 shows a comparison of the two-time series plots for Junction 1. With effectively no difference between the two plots, it is determined that FLO-2D correctly calculates inlet flow.

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

**Figure 22: Hand Calculated Flow vs. FLO-2D Calculated Flow for Junction 1**

The “swmm.RPT” file presented in Attachment 11b contains all the output data from the SWMM model. To ensure that FLO-2D properly transfers the time series data, the “SWMMQIN.OUT” flow data is compared to the inflow data in the “swmm.RPT” file to make sure they are identical. Figure 23 shows the plots of the FLO-2D calculated inflow, and the SWMM calculated inflow for Junction 1. It can be seen that there is effectively no difference in the two plots, thereby proving that flow data is passed correctly between FLO-2D and SWMM.

**Figure 23: FLO-2D Inlet Flow vs. SWMM Junction Flow**

Based on the results in Table 6, it is determined that FLO-2D is able to properly and accurately transfer flow into a SWMM model and then have the discharge from the SWMM drainage system back to the FLO-2D model. The results show that FLO-2D Pro is accurately predicting the flow depth within 5%.

---	----------------------	--

#### **Test Case 4b (SWMM Pipe Flow) Model Setup**

The purpose of this test is to validate pipe hydraulic analyses performed by SWMM. The hydraulic parameters of the pipe flow computed by the SWMM model are compared to the same parameters determined by hand calculations. The compared flow parameters include:

- Ratio of pipe flow to the full-pipe flow and flow velocity (for partial pipe flow scenario)
- Slope of hydraulic grade line for the full-pipe flow condition (for full pipe flow scenario)

A SWMM model was set up with one pipe with input parameters listed below and a layout is presented in Figures 24.

Pipe Invert Elevations:

- upstream = 105 ft,
- downstream-100 ft;

Pipe Length L = 1,000 ft;

Pipe Slope S = 0.5% (0.005 ft / ft);

Pipe Diameter D = 30 in;

SWMM offers the two methods for solving hydraulic equations - dynamic wave or kinematic wave analysis. The dynamic wave analysis solves the complete form of the St. Venant flow equations and therefore produces the most theoretically accurate results. Perry LIP calculation utilizes the dynamic wave approach for analyzing flow in the storm drain system. Therefore, dynamic wave option is selected in SWMM model for both scenarios listed below.

Two scenarios were evaluated:

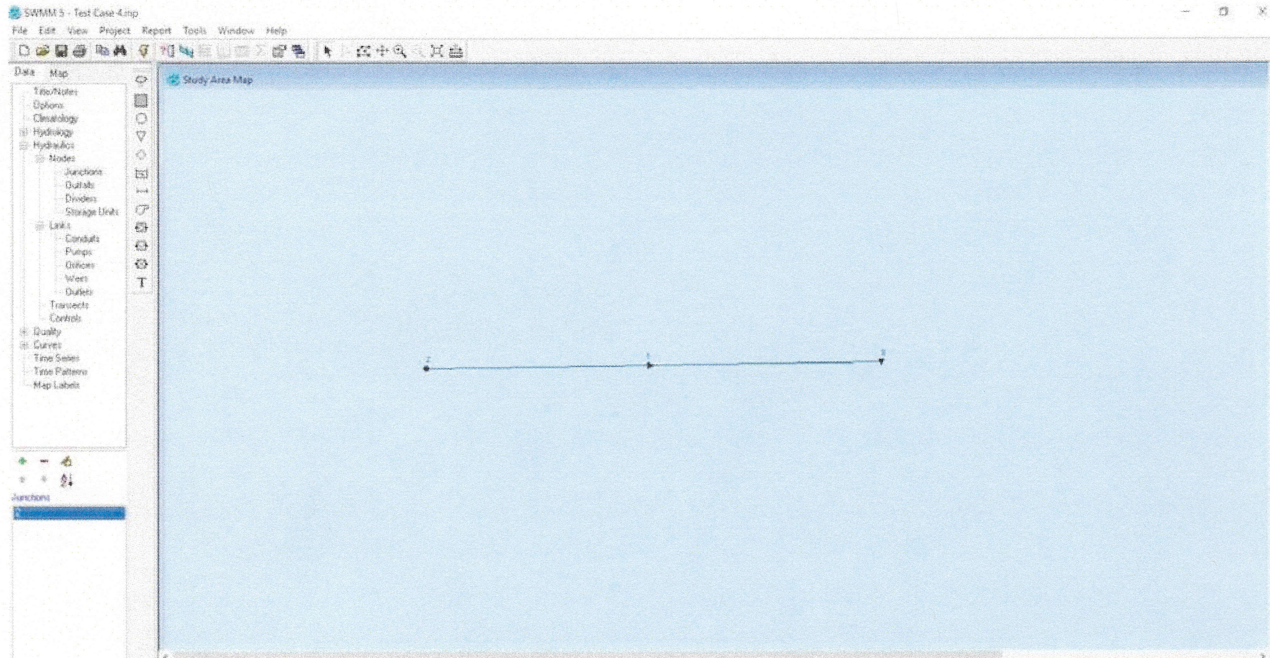

1. Partial-pipe flow
2. Full-pipe flow under a surcharge

**Figure 24: SWMM Layout**

### Partial-Pipe Flow

A partial-pipe flow is the same as a uniform open-channel flow. Under these conditions, flow has a constant depth and the slope of the hydraulic grade line (HGL) is equal to the pipe slope. The hydraulic parameters of this flow regime can be calculated using Manning's equation (Equation 1):

$$Q = \frac{1.49}{n} A R^{2/3} S^{0.5} \quad \text{Equation 1 (Reference 12)}$$

Where:

Q – Discharge (cfs)

V – Velocity (ft/sec)

R – Hydraulic Radius (ft) = A (area) / P (wetted perimeter)

n – Manning's Roughness Coefficient

S – Slope (ft/ft)

The inputs used for both SWMM model and hand calculation are as follows:

Manning's roughness coefficient  $n = 0.024$ ;

Pipe flow  $Q = 8$  cfs (a steady flow applied in the junction)

The pipe profile is shown in Figure 25 and SWMM output results are shown in Figure 26 and in Attachment 12a.

**Figure 25: Water Surface Profile Partially Full Pipe Test Case**

### Full-Pipe Flow under Surchage

SWMM utilizes Hazen Williams or Darcy-Weisbach equations to calculate hydraulic parameters for the full-pipe flow under pressure (surchage) conditions. Both methods are acceptable to calculate flow under pressure. Perry LIP calculation utilizes Darcy-Weisbach for analyzing flow in the storm drain system. Therefore, Darcy-Weisbach equation (Equation 2) is selected for both SWMM model and hand calculation.

The standard form of the Darcy-Weisbach loss equation (Equation 2) is:

$$S_f = \frac{fU^2}{2gD} \quad \text{Equation 2 (Reference 11, Equation 7-29)}$$

Where:

$S_f$  – Friction Slope (head loss per unit length) (ft/ft)

Friction Slope = (Upstream HGL – Downstream HGL) / Length of pipe

$U$  – Flow Velocity (ft/sec)

$g$  – Gravitational Constant (32.2 ft/sec<sup>2</sup>)

$D$  – Pipe Diameter (in)

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

For transition and rough turbulent flow, friction factor can be calculated utilizing Equation 3:

$$f = \frac{0.25}{\left[\log\left(\frac{\epsilon}{3.7D}\right)\right]^2} \quad \text{Equation 3 (Reference 11, Equation 7-37)}$$

Where:

f - Friction Factor

$\epsilon$  – Darcy-Weisbach Surface Roughness Height (ft)

Darcy-Weisbach roughness height is dependent on the pipe material and serves the same purpose as the Manning roughness coefficient or the Hazen-Williams C-factor. For this test, concrete pipe was selected, As listed in the SWMM manual (Reference 12, Table 7-4), Darcy-Weisbach roughness coefficient for concrete is in a range of 0.012-0.12. An average value of 0.066 is utilized for the test run and hand calculation.

The inputs used for both SWMM model and hand calculation are as follows:

Darcy-Weisbach roughness height  $\epsilon = 0.066$  (Reference 11);

Pipe flow Q = 50 cfs (a steady flow applied in the junction)

SWMM model provides the HGL elevation at both upstream and downstream end. Since pipe is flowing full, HGL at downstream end is at top of the pipe (102.5 ft). SWMM output does not provide frictional slope. However, HGL elevation from SWMM model can be utilized to calculate slope of HGL (or frictional slope). Frictional slope from SWMM model is compared with hand calculation to validate SWMM pipe flow feature. SWMM output results are shown in Figure 27 and in Attachment 12a.

### **Test Case 4b (SWMM Pipe Flow) Results**

Results from the SWMM model are included in Attachment 12a and hand calculations are shown in Attachment 12b. Excerpts from SWMM results for partial and full flow pipes are shown in Figure 26 and Figure 27, respectively. Under full flow conditions, there is a water column (surcharge) at the upstream junction. Figure 27 shows water surface elevation profile with the HGL elevation at the upstream end which allows to calculate the hydraulic slope  $S_f$ .

**Table 7: Comparison of Results – Test Case 4b**

<b>Method of Computation</b>	<b>SWMM Result</b>	<b>Hand Calculation</b>	<b>Percent Difference</b>
Partial-Pipe Flow	Pipe Flow/ Max Flow – 0.51 Flow Depth / Max Depth – 0.51 Velocity – 3.21 ft/sec	Pipe Flow/ Max Flow – 0.51 Flow Depth / Max Depth – 0.51 Velocity – 3.21 ft/sec	0.00% 0.00% 0.00%
Full-Pipe Flow under Surge	Frictional Slope = (118.06-102.5) / 1000 = 0.01556 ft/ft	Frictional Slope = 0.01548	0.52%

As shown in Table 7, SWMM is able to accurately model pipe flow hydraulics within 5% difference with the hand calculation. Therefore, tested software modules are determined to function correctly.

#### **Test Case 5 – Green-Ampt Infiltration**

##### **Test Case 5 (Green-Ampt Infiltration) Model Setup**

For this test case, the method used consists of a comparison of a hand calculation solution for the Green-Ampt Infiltration (presented in Attachment 13) to FLO-2D Pro output data produced for the infiltration model setup.

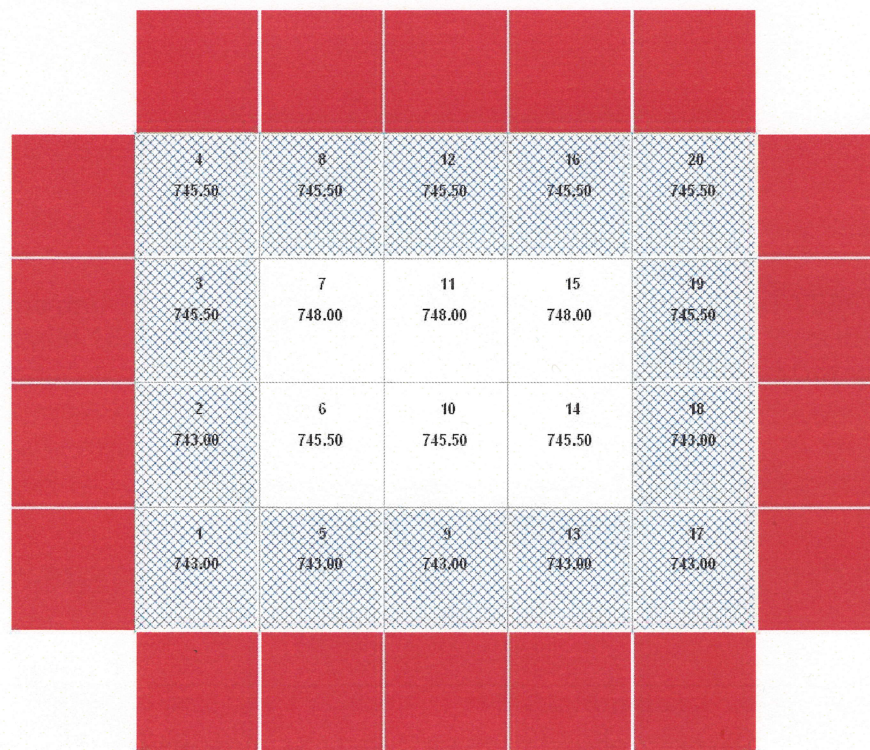

The Green-Ampt Infiltration consisted of 14 grid cells flowing into an adjacent 6 grid cells that compute the depth of infiltration under the influence of routed runoff. Figure 28 illustrates the Green-Ampt model. The grid cells in both models are 100 feet by 100 feet and are both at a 2.5% slope. The model inputs for the Green-Ampt model are presented in Attachment 14.

The model inputs for Green-Ampt are as follow:

1. System and numerical stability control files (Attachment 14, “CONT.DAT” and “TOLER.DAT”);
2. File for Images, shape files and polylines to project when open (Attachment 14, “SUPPLEMENT.DAT”);
3. The model consists of 20 100-ft-square grid elements (Attachment 14, “FPLAIN.DAT”, “CADPTS.DAT” and TOPO.DAT”);
4. A uniform Manning’s roughness coefficient n-value for the model was arbitrarily set at 0.040 for the 20 grid elements (Attachment 14, “MANNINGS\_N.DAT”);
5. Outflow hydrographs (Attachment 14, “OUTFLOW.DAT”);
6. Rainfall in FLO-2D (Attachment 14, “RAIN.DAT”);
7. Infiltration (Attachment 14, “INFIL.DAT”).

### **Test Case 5 (Green-Ampt Infiltration) Results**

The FLO-2D model is run for 1-hour simulation period. The results of the grid elements shown in the FLO-2D model setup (Figure 28) are given in Table 8. The infiltration (ft) at the end of the FLO-2D simulation for each floodplain element is written to the 'FPINFILTRATION.OUT' file with grid element x- and y-coordinates (Attachment 15). In addition, total infiltrated and intercepted (or abstracted) water depth is also given in the 'SUMMARY.OUT' file (Attachment 15). The total

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

infiltrated and intercepted depth is the depth of water due to the total infiltrated depth of grids (from 'FPINFILTRATION.OUT') and abstraction (which is considered in this model as 0.025 in.). Note that FLO-2D provides total infiltration depth in feet at the end of simulation period.

The infiltration results computed by the FLO-2D are presented in Table 8. Note that the hand calculation is setup in Microsoft Excel for infiltration component of 1D vertical flow model whereas FLO-2D is a volume conservation 2D model which allows full interaction of all its multiple model components and the difference with hand calculation is anticipated.

**Table 8: FLO-2D Green-Ampt Model Results**

<b>Grid Cell No.</b>	<b>X-Coordinate</b>	<b>Y-Coordinate</b>	<b>Final Infiltration Depth (ft)</b>	<b>Final Infiltration Depth (in)</b>	<b><sup>(1)</sup> Overland infiltrated and intercepted Water (in)</b>

<b>Average infiltration of the grids</b>			<b>0.2710</b>	<b>3.256</b>	<b>3.231<sup>(1)</sup></b>
<i><sup>(1)</sup> Overland infiltrated and intercepted water is the sum of the average infiltration of the 6 grid cells and the abstraction (0.025 in), i.e. the total grids infiltration depth, 3.256 - 0.025 = 3.231 inches (Attachment 15)</i>					

### **Hand Calculation of infiltration**

The governing equations used to verify the FLO-2D model of the Green-Ampt infiltration model are given in Equation 4 and Equation 5, originally from the City of Seattle Stormwater Manual (CSSWM), Appendix F: Hydrologic Analysis and Design as Equation 1 and Equation 2 on page F-5 and F-6 (Reference 1).

$$F_{t+\Delta t} = F_t + K\Delta t + \psi\Delta\theta \ln \left[ \frac{F_{t+\Delta t} + \psi\Delta\theta}{F_t + \psi\Delta\theta} \right] \quad \text{Equation 4 (Reference 1)}$$

$$f_t = K \left( \frac{\psi\Delta\theta}{F_t} + 1 \right) \quad \text{Equation 5 (Reference 1)}$$

Where;

$f_t$  = infiltration rate (in/hr)

$\psi$  = initial matric potential of the soil (inches)

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

$\Delta\theta$  = difference of soil water content after infiltration with initial water content

K = hydraulic conductivity (in/hr)

$F_t$  = cumulative infiltration at time t (inches)

$F_{t+\Delta t}$  = cumulative infiltration at time (t+  $\Delta t$ ) (inches)

$\Delta t$  = time incremental (hours)

A 1-hour rainfall with a time step of 1-minute is used to verify the model output from Table 8 and Table 9. As suggested in the FLO-2D Reference Manual (Reference 5), the initial abstraction is filled prior to simulating infiltration. Then based on Equation 4 and Equation 5 and the rainfall magnitude, the actual infiltration rate and the cumulative infiltration depth is calculated. The calculation procedure is given below and shown in Attachment 13.

**Step 1:** The input parameters used in the FLO-2D Infiltration model are used for the hand calculation from Figure 29. The parameter of the model and intermediate computational values are shown in Table 9.

**Table 9: Green-Ampt Parameters and Intermediate Calculations**

No.	Parameters	Symbol	Values
1	Hydraulic conductivity (in/hr)	K	2.675
2	Suction Head (in)	$\psi$	2.15
3	Initial soil moisture (%)	$\Theta_i$	35
4	Saturation (%)	$\Theta_s$	100
5	Porosity (dimensionless)	$\phi$	0.437
<b>Intermediate Calculation and Initial Values</b>			
6	$\Delta\theta = (\Theta_s - \Theta_i) * \phi$	=	0.284
7	$A = (\psi * \Delta\theta)$	=	0.611
8	$F_o$ = initial F (in)	=	0.040
9	$F_p$ = Initial Ponding (in/hr)	=	0.025
10	$F_p$ = Initial Ponding (in/min)	=	0.00042
11	$\Delta t$ = time interval (hr)	=	0.017
12	$K * \Delta t$ (in)	=	0.045

**Step 2:** The value of 0.025 in/hr is assumed initial interception (abstraction) from the rainfall consistent with the FLO-2D mode setup. FLO-2D abstracts the initial rainfall prior to infiltration simulation. Consistent to the FLO-2D model procedure, a rainfall excess is created by subtracting the initial abstraction from the rainfall intensity.

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

1. For time step 1-minute, Rainfall event ( $P_t$ ) = 0.62 in (per minute) (Column 4, Attachment 13);
2. The abstraction  $0.025 \text{ in/hr} = 0.025/60 = 0.00042 \text{ in (per minute)}$ ;
3. Excess Rainfall ( $\text{in/min}$ ) =  $0.62 - 0.00042 = 0.62 \text{ in}$  (Column 5, Attachment 13).  
this is calculated for all 60 values of the rainfall until the end of the hour.

**Step 3:** The Cumulative Infiltration capacity is calculated using Equation 4. An initial value  $F_t$  is assumed (Column 6, Attachment 13) and compared with the computed values of  $F_t'$  (Column 7, Attachment 13). The final cumulative  $F_t$  is solved using solver iteration algorithm embedded in Excel.

$F_t = 0.001$ ,  $K \Delta t = 0.045 \text{ in}$ ,  $A = (\psi \Delta \Theta) = 0.611 \text{ in}$ . Assume  $F_1 = 0.1$ ,  $F_{0+1} = 0.001 + 0.045 + 0.611 \ln [(0.1 + 0.611)/(0.001 + 0.611)] = 0.137 \text{ in}$ , the difference between the assumed  $F_1$  and computed  $F_1 = 0.037 \text{ in}$ . using Microsoft Excel solver, iteration results  $F_1 = 0.26 \text{ in}$ , the difference between the assumed and computed values is  $0.000 \text{ in}$  (Column 8, Attachment 13). likewise, the cumulative infiltration capacity is determined until the end of the hour.

**Step 4:** Compute the infiltration capacity rate  $f_t$  (in/hr) using Equation 5. Start from the first infiltration rate ( $f_1$ ) by using the values of  $K = 2.675 \text{ in/hr}$ ,  $A = (\psi \Delta \Theta) = 0.611 \text{ in}$  and  $F_1$  from Step 2 (Column 9, Attachment 13).

**Step 5:** Compute actual infiltration rate (in/hr) by comparing with the rainfall intensity obtained in Step 1. If rainfall excess is less than or equal to the infiltration rate, the actual infiltration rate is equal to the rainfall excess else the infiltration is equal to the potential rate (Column 10, Attachment 13).

For example, at time = 1 min, Rainfall excess (RE) is 0.62 in. (Column 5, Attachment 13) and the infiltration capacity is 0.15 in. (Column 9, Attachment 13), so the infiltration capacity is less than the rainfall excess, so the actual infiltration is ( $f_a$ ) is 0.15 in. (Column 10, Attachment 13). Likewise the actual infiltration is determined until the end of the hour.

**Step 6:** the actual cumulative infiltration is the summation of previous time step actual infiltration and the current infiltration rate (i.e.  $F_{a1} = F_{a0} + f_{a1}$ ) (Column 11, Attachment 13).

For example, at time  $t = 1\text{-min}$ , the accumulated actual infiltration depth at the end of time step 1 is  $0.0 + 0.15 = 0.15 \text{ in}$ . in this way the cumulative infiltration ( $F_a$ ) is computed. The total cumulative depth of actual infiltration at the end of the hour is 3.4348 in. (0.2862 ft.). the full computation of the hand calculation in Excel is shown in Attachment 13.

### **Comparison of Results and Conclusion**

FLO-2D results of Green-Ampt infiltration model are compared with the hand calculated infiltration model results computed using the Green-Ampt Equation 4 and Equation 5, in the previous section.

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

**Table 10: Comparison of Results – Test Case 5**

<b>Method of Computation</b>	<b>Hand Calculated (in)</b>	<b>FLO-2D Computed (in)</b>	<b>Percent Difference</b>
Infiltration Volume	3.4348	3.231	5.93%

As shown in Table 10, the difference between the final infiltration depth between Green-Ampt FLO-2D model setup and hand calculation is 5.93%. Based on these results it was determined that FLO-2D is able to properly and accurately (within 10%) calculate the Green-Ampt infiltration in the FLO-2D model.

The results of the test case meet the acceptability criteria specified in Section IV. Therefore, tested software module is determined to function correctly.

### **Test Case 6 –Rain, ARF, and WRF**

#### **Test Case 6 (Rain, ARF, and WRF) Model Setup**

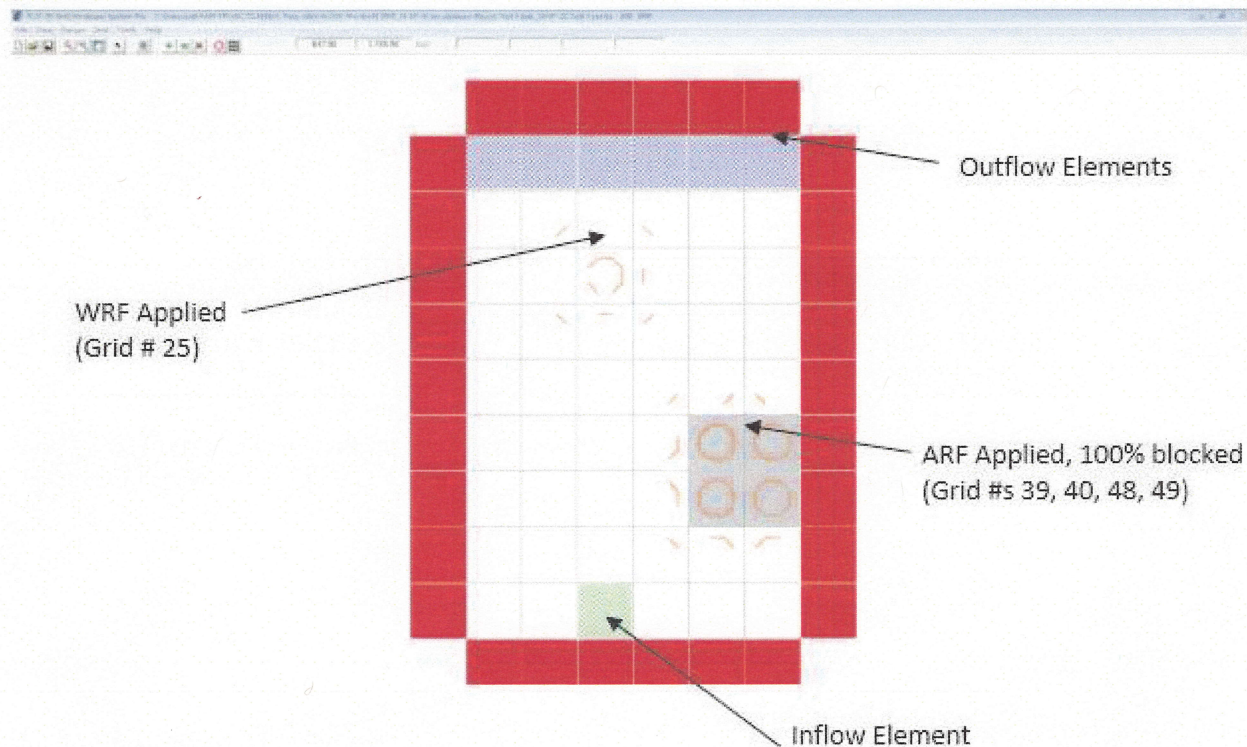

This test case verifies that the FLO-2D Pro model accurately transforms rainfall into surface runoff and appropriately represents modeling parameters such as Area Reduction Factors (ARF), and Width Reduction Factors (WRF).

The inputs for both the FLO-2D Pro model and the test case hand calculation are as follows:

1. The simple flume model is 8 elements long by 6 elements wide, each element being 50 ft by 50 ft with 6 grid elements designated as outflow cells.
2. A floodplain slope of 2% (0.02 ft/ft);
3. A uniform Manning's n-value (roughness coefficient) is 0.05.
4. A total rainfall of 3.0 inches over 2-hour period.
5. A steady inflow of 2,000 cfs is used.

The inputs described above are presented in Figure 30, Figure 31, and Figure 32. The data input and output files are included in Attachments 16 and 17 for rain, ARF, and WRF features.

Figure 32: Grid Element Ground Surface Elevations

### Test Case 6 (Rain) Results

#### Rainfall to runoff transformation

The rainfall is applied over the simple model of 8 x 6 grid elements, 50 sq.ft. each with the total project area of 120,000 sq.ft. The total rainfall of 3 inches is applied to the model. Then, the total volume of water is calculated as:

$$[120,000 \text{ sq.ft.} \times (3.0 \text{ in} / 12 \text{ in/ft})] / 43,560 \text{ sq.ft.} / \text{acre} = 0.6887 \text{ acre-ft}$$

The applied volume to the model is shown in SUMMARY.OUT (Attachment 16) file with an excerpt presented below:

```
=====
*** INFLOW (ACRE-FEET) ***

TOTAL POINT RAINFALL:                2.9982 INCHES

                                     WATER

RAINFALL VOLUME                      0.688

```

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

The results from the FLO-2D Pro Model output and the hand calculation are presented in Table 11.

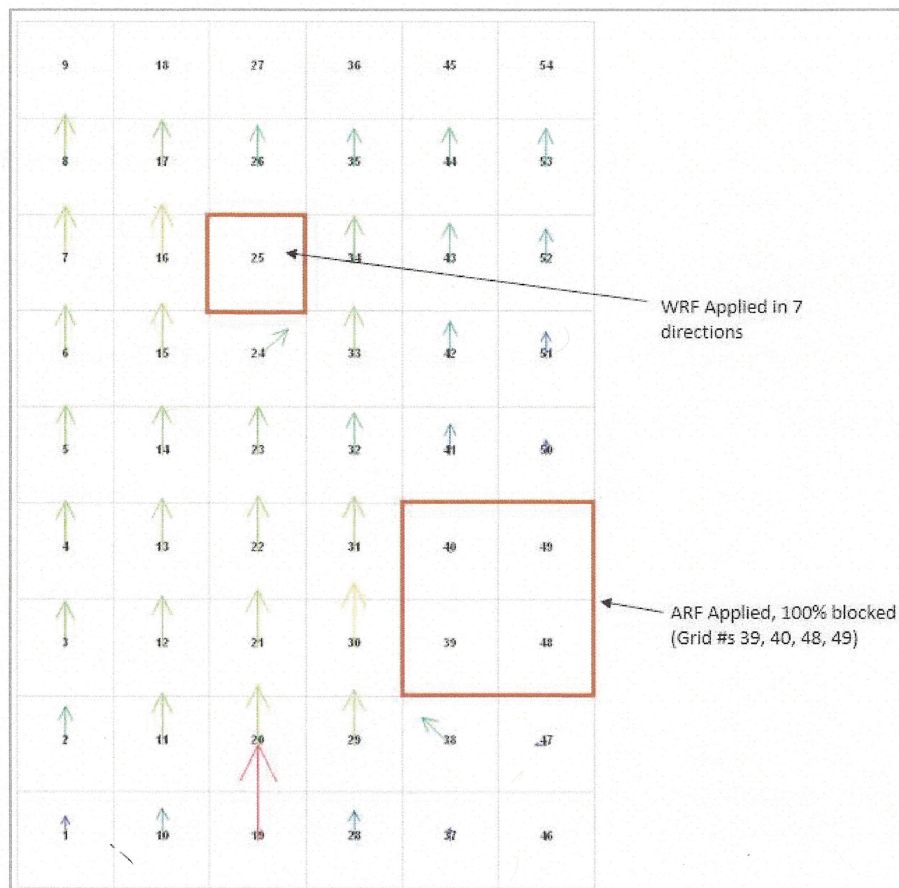

**Table 11: Comparison of Results – Test Case 6**

<b>Method of Computation</b>	<b>FLO-2 Pro Model</b>	<b>Hand Calculation</b>	<b>Percent Difference</b>
Rainfall volume	0.688 acre-ft	0.6887 acre-ft	0.0%

Based on the results shown in Table 11, FLO-2D model accurately converts rainfall volume into surface runoff volume.

### **Area and Width Reduction Factors**

To check FLO-2D performance for the area and width reduction factors, the rainfall was turned on and inflow hydrograph was introduced to the model with a steady inflow of 2000 cfs. The resulting velocity vectors (Figure 33) show that FLO-2D model appropriately takes into account the area and width reduction factors.

**Figure 33: Grid Element Maximum Velocity**

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

The final floodplain depths are listed in DEFPF.OUT (Attachment 17) and an excerpt is shown in Figure 34. The partially blocked grid 25 has inflow from the adjacent grid 16. As such, the flow depth in grid 25 is close to the flow depth in grid 16, as expected. However, the flow depth in grids 39,40,48, and 49 are zero since these grids are blocked completely. Note that grid 50 has a reduced flow depth (appropriate) compared to other grids since it is significantly blocked from the flow propagation by the upstream completely blocked grids.

---	----------------------	--

### **Test Case 7 – Levees**

This test case verifies the ability of the FLO-2D model to accurately calculate flow over a levee when the levee is overtopped. The modeled flow over the levee is compared to the hand-calculated levee overtopping flow. A broad-crested weir discharge equation (Equation 5) is used for the hand calculation.

This test also demonstrates that the FLO-2D model appropriately adjusts the discharge over a levee if Width Reduction Factors (WRFs) are used to reduce the length of the levee. The same hand calculation is used to calculate the discharge over the reduced-length levee.

Three scenarios were considered to test flow over a levee:

1. Scenario 1 - Levee is not blocked (WRF= 0.0);
2. Scenario 2 - Levee is partially blocked: 100% (WRF= 1.0) in two directions (southwest and southeast) and 50% (WRF= 0.5) in one direction (south);
3. Scenario 3 - Levee is partially blocked: 100% (WRF= 1.0) in two directions (southwest and southeast) and open (WRF= 0.0) in one direction (south).

A simple model, 60 elements long and 4 elements wide, was generated for the levee test case. Each element is 50 ft x 50 ft. A levee was placed across the model through grid #s 161, 162, 163, and 164 as shown in Figure 35. The FLO-2D Pro model parameters are as follows:

1. A floodplain slope is 0.003 ft/ft;
2. A uniform Manning's n-value (roughness coefficient) is 0.10.
3. A single inflow element with a steady discharge of 300 cfs is used.

<b>Software Name and Build:</b> <b>FLO-2D Pro Build 16.06.16</b>	<b>Software Test</b>	<b>RFCA Number:</b> <b>PY20170069 FLO2D, PY20170070</b> <b>SWMM, PY20170071 ArcGIS,</b> <b>PY20170074 Flooding Computer</b>
---	----------------------	--

**Figure 35: Levee Placement**

The maximum flow depths for the levee simulation are presented in Figure 36 where the resulting water depths clearly show water accumulation upstream of the levee.

Software Name and Build: FLO-2D Pro Build 16.06.16	Software Test	RFCA Number: PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
---	---------------	--

**Figure 36: Levee Simulation Maximum Flow Depths**

### **Flow Over Levee**

A uniform levee crest elevation of 13 ft was assigned to three levee elements (grid #s 161, 163, and 164) and a lower crest elevation of 6 ft was assigned to one levee element (grid # 162). This setup forces levee overtopping though the lower portion of the levee. The levee profile is shown in Figure 37.

**Figure 37: Levee Elevation Profile**

The FLO-2D utilizes broad-crested weir equation to calculate flow over a levee.

$$Q = CLH_d^{1.5}$$

Equation 5 (Reference 11)

Where:

Q – discharge (cfs)

C – Weir coefficient, C = 3.09 (Figure 38)

L – Length of weir (ft)

H<sub>d</sub> = Headwater depth (ft) The length of the levee in FLO-2D is calculated based on the grid size. Each FLO-2D grid discharges flow into 8 directions and the length of each direction is 0.4214 times the grid size (Reference 5). In this case, the grid size is 50 ft x 50 ft. Therefore, the length of the levee for 1 flow direction is 21.07 ft (50 x 0.4214).

### Test Case 7 (Levee) Results

The FLO-2D resulting maximum water surface elevation at each grid is shown in MAXWSELEV.OUT (Attachment 18b). The maximum water surface elevation at the grid element immediately upstream of the levee opening (Grid #158) was utilized to calculate the headwater depth over the levee. The headwater depth from the FLO-2D run was utilized in the hand calculation to calculate flow over a levee utilizing a broad-crested weir equation.

Table 12 provides comparison of the FLO-2D and hand calculation results. Figure 39 through Figure 41 provide excerpt of the maximum water surface elevation (MAXWSELEV.OUT) and levee discharge flow (LEVOVERTOPMAX.OUT) for all three scenarios listed in Table 12. The hand calculations are presented in Attachment 18a and the output results from the FLO-2D model are presented in Attachment 18b.

MAXIMUM LEVEE OVERTOPPING DISCHARGE BY GRID ELEMENT				
162		2.488	289.09	

**Figure 41: Scenario 3 Results (WRF= 1.0 on 2 sides and WRF= 0.0 on 1 side)**

<b>Software Name and Build:</b> FLO-2D Pro Build 16.06.16	<b>Software Test</b>	<b>RFCA Number:</b> PY20170069 FLO2D, PY20170070 SWMM, PY20170071 ArcGIS, PY20170074 Flooding Computer
--	----------------------	---

**Table 12: Comparison of Results – Test Case 7**

<b>Scenario</b>	<b>Max. WSE at Grid 158 from FLO-2D (ft) (1)</b>	<b>Headwater Depth over Levee (ft) (2) = (1) - 6 ft</b>	<b>Max. Flow over Levee from FLO-2D (cfs)</b>	<b>Max. Flow over Levee from Hand Calc. (cfs)</b>	<b>Percent Difference</b>
Scenario 1 - No WRF	7.3952	1.3952	311.41	316.38	1.58%
Scenario 2 - WRF=1.0 in two directions and WRF = 0.5 in one direction	9.7242	3.7242	229.97	229.96	0.00%
Scenario 3 - WRF=1.0 in two directions and no WRF in one direction	8.7327	2.7327	289.09	289.09	0.00%

As shown in Table 12, the difference between the FLO-2D and hand calculation results are < 2% for Scenario 1 and 0% for Scenarios 2 and 3. Based on these results, it was determined that FLO-2D can properly and accurately (within 5%) calculate discharge over a levee with and without WRFs applied.

The results of the test case meet the acceptability criteria specified in Section IV. Therefore, tested software module is determined to function correctly.

## **Test Case 8 – Topography**

### **Test Case 8 (Topography) Model Setup**

The FLO-2D Grid Developer System (GDS) is a GIS integrated software tool used to facilitate the creation of all required data to run the FLO-2D model. GDS simplifies construction of the finite difference grid system and allows graphical editing of its attributes and components. The GDS will overlay the grid system on a digital terrain map or a Digital Terrain Model (DTM) set of points and will interpolate and assign elevations to the grid elements.

An ASCII file representing the topographical surface in the form of multiple points with x, y, and z coordinates is imported in the FLO-2D GDS to build a topographic surface in FLO-2D. Figure 42 shows grid cells as rectangles and average grid elevation assigned by the FLO-2D is shown in the middle of the grid in blue text for each grid. Each grid contains four elevation points imported from an ASCII file. The number of ASCII points within the grid can vary and depends on size of grid and resolution of the original topographic data. GIS ASCII data is shown Table 13.

### **Test Case 8 (Topography) Results**

Table 13 shows that there are 4 ASCII points in each grid cell. Average value of elevation from 4 points in a grid cell is compared to the corresponding elevation from FLO-2D model. The results from the FLO-2D Pro Model and the ArcGIS ASCII files are presented in Table 14.

**Table 14: Comparison of Results – Test Case 8**

Grid No.	FLO-2 Pro Model Elevation (ft)	Average Elevation from GIS ASCII Data (ft)	Percent Difference
30621	617.98	617.9751	0.00%
30622	617.92	617.9235	0.00%
30623	617.83	617.8349	0.00%
30624	617.82	617.8179	0.00%
30936	618.14	618.1425	0.00%
30937	618.04	618.0445	0.00%
30938	617.94	617.94	0.00%
30939	617.86	617.8609	0.00%
31253	618.18	618.1841	0.00%
31254	618.09	618.0936	0.00%
31255	618.00	618.0037	0.00%
31256	617.95	617.9515	0.00%

Table 14 indicates that the FLO-2D Pro model accurately assigns the grid elevations from ASCII files. The results of the test case meet the acceptability criteria specified in Section IV. Therefore, tested software module is determined to function correctly.

## **DISCLAIMER**

The information in this document has been funded wholly or in part by the U.S. Environmental Protection Agency (EPA). It has been subjected to the Agency's peer and administrative review, and has been approved for publication as an EPA document. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

## FOREWORD

The U.S. Environmental Protection Agency is charged by Congress with protecting the Nation's land, air, and water resources. Under a mandate of national environmental laws, the Agency strives to formulate and implement actions leading to a compatible balance between human activities and the ability of natural systems to support and nurture life. To meet this mandate, EPA's research program is providing data and technical support for solving environmental problems today and building a science knowledge base necessary to manage our ecological resources wisely, understand how pollutants affect our health, and prevent or reduce environmental risks in the future.

The National Risk Management Research Laboratory is the Agency's center for investigation of technological and management approaches for reducing risks from threats to human health and the environment. The focus of the Laboratory's research program is on methods for the prevention and control of pollution to the air, land, water, and subsurface resources; protection of water quality in public water systems; remediation of contaminated sites and ground water; and prevention and control of indoor air pollution. The goal of this research effort is to catalyze development and implementation of innovative, cost-effective environmental technologies; develop scientific and engineering information needed by EPA to support regulatory and policy decisions; and provide technical support and information transfer to ensure effective implementation of environmental regulations and strategies.

Water quality impairment due to runoff from urban and developing areas continues to be a major threat to the ecological health of our nation's waterways. The EPA Storm Water Management Model is a computer program that can assess the impacts of such runoff and evaluate the effectiveness of mitigation strategies. This report documents the Quality Assurance testing that was performed on the dynamic wave flow routing portion of the recently modernized and updated version 5.0 of the model. As a result of this testing, users can have confidence that the updated model is performing correctly.

Sally C. Gutierrez, Director  
National Risk Management Research Laboratory

## 1. Introduction

The Storm Water Management Model (SWMM) was originally developed in 1971 as a computer-based tool for simulating storm water runoff quantity and quality from primarily urban areas (Metcalf & Eddy, Inc., et al., 1971). Since then it has undergone several major updates, the last of these being Version 4.4 (Huber and Dickinson, 1992) which is available through an Oregon State University web site (<http://ccee.oregonstate.edu/swmm/>). Throughout each of these updates the general block nature of the overall program as well as the basic structure of its Fortran source code has remained more or less intact.

In 2002, the U.S. Environmental Protection Agency's Water Supply and Water Resources Division partnered with the consulting firm CDM to develop a completely re-written version of SWMM. The goal of this project was to apply modern software engineering techniques to produce a more maintainable, extensible, and easier to use model. The result of this effort, SWMM 5 (Rossman, 2005), consists of a platform-independent computational engine written in C as well as a graphical user interface for the Microsoft Windows operating system written in Delphi. A rigorous Quality Assurance (QA) program was developed to insure that the numerical results produced from the new SWMM 5 model would be compatible with those obtained from SWMM 4.4 (Schade, 2002). The new SWMM 5 software was released to the public in October of 2004.

The most numerically challenging sub-model to implement within SWMM 5 was the dynamic wave flow routing routine known as Extran (for Extended Transport). It routes non-steady flows through a general network of open channels, closed conduits, storage facilities, pumps, orifices and weirs. In contrast to simpler routing methods, this procedure can model such phenomena as backwater effects, flow reversals, pressurized flow, and entrance/exit energy losses. Rather than simply encode a line-for-line copy of Extran, SWMM 5 restructured the code in a more readable and maintainable fashion. It also employed a slightly modified computational scheme with the intent of producing more numerically stable solutions in less time.

This report documents the Quality Assurance testing program that was used to compare the dynamic wave flow routing procedures of SWMM 4.4 and SWMM 5 with one another. Before describing the tests made and the results obtained it will be useful to contrast the way in which each version of the model implements dynamic wave flow routing.

## 2. Routing Models

It should be noted that SWMM 4.4 (hereafter referred to as simply SWMM 4) actually contains three different procedures that can be used for dynamic wave flow routing. The choice is determined by the value of the ISOL parameter provided by the user in SWMM 4's input data file. The Explicit Method (ISOL = 0) is the default and will be the method compared against in this report. Appendix A discusses this decision in more detail.

### Governing Equations

Both SWMM 4 and 5 solve the same form of the conservation of mass and momentum equations that govern the unsteady flow of water through a drainage network of channels and pipes. These equations, known as the Saint Venant equations, can be expressed in the following form for flow along an individual conduit:

$$\frac{\partial A}{\partial t} + \frac{\partial Q}{\partial x} = 0 \quad \text{Continuity} \quad (1)$$

$$\frac{\partial Q}{\partial t} + \frac{\partial (Q^2 / A)}{\partial x} + gA \frac{\partial H}{\partial x} + gAS_f + gAh_L = 0 \quad \text{Momentum} \quad (2)$$

where  $x$  is distance along the conduit,  $t$  is time,  $A$  is cross-sectional area,  $Q$  is flow rate,  $H$  is the hydraulic head of water in the conduit (elevation head plus any possible pressure head),  $S_f$  is the friction slope (head loss per unit length),  $h_L$  is the local energy loss per unit length of conduit, and  $g$  is the acceleration of gravity. Note that for a known cross-sectional geometry, the area  $A$  is a known function of flow depth  $y$  which in turn can be obtained from the head  $H$ . Thus the dependent variables in these equations are flow rate  $Q$  and head  $H$ , which are functions of distance  $x$  and time  $t$ .

The friction slope  $S_f$  can be expressed in terms of the Manning equation as:

$$S_f = \frac{n^2 V |V|}{k^2 R^{4/3}}$$

where  $n$  is the Manning roughness coefficient,  $V$  is the flow velocity (equal to the flow rate  $Q$  divided by the cross-sectional area  $A$ ),  $R$  is the hydraulic radius of the flow's cross-section, and  $k = 1.49$  for US units or 1.0 for metric units. The local loss term  $h_L$  can be expressed as  $\frac{KV^2}{2gL}$  where  $K$  is a local loss coefficient at location  $x$  and  $L$  is the conduit length.

To solve equations (1) and (2) over a single conduit, one needs a set of initial conditions for  $H$  and  $Q$  at time 0 as well as boundary conditions at  $x = 0$  and  $x = L$  for all times  $t$ .

When analyzing a network of conduits, an additional continuity relationship is needed for the junction nodes that connect two or more conduits together (see Figure 1.1). In SWMM a continuous water surface is assumed to exist between the water elevation at the node and in the conduits that enter and leave the node (with the exception of free fall drops should they occur). The change in hydraulic head  $H$  at the node with respect to time can be expressed as:

$$\frac{\partial H}{\partial t} = \frac{\sum Q}{A_{store} + \sum A_s} \quad (3)$$

where  $A_{store}$  is the surface area of the node itself,  $\sum A_s$  is the surface area contributed by the conduits connected to the node, and  $\sum Q$  is the net flow into the node (inflow – outflow) contributed by all conduits connected to the node as well as any externally imposed inflows. Note that the flow depth at the end of a conduit connected to a node can be computed as the difference between the head at the node and the invert elevation of the conduit.

**Figure 1.1 Node-Link Representation of a Drainage System in SWMM (from Roesner et al, 1992).**

### General Solution for Conduits

Equations (1), (2), and (3) are solved in SWMM by converting them into an explicit set of finite difference formulas that compute the flow in each conduit and head at each node for time  $t + \Delta t$  as functions of known values at time  $t$ . The equation solved for the flow in each conduit is:

$$Q_{t+\Delta t} = \frac{Q_t + \Delta Q_{gravity} + \Delta Q_{inertial}}{1 + \Delta Q_{friction} + \Delta Q_{losses}} \quad (4)$$

The individual  $\Delta Q$  terms have been named for the type of force they represent and are given by the following expressions:

$$\Delta Q_{gravity} = g\bar{A}(H_1 - H_2)\Delta t / L$$

$$\Delta Q_{inertial} = 2\bar{V}(\bar{A} - A_t) + \bar{V}^2(A_2 - A_1)\Delta t / L$$

$$\Delta Q_{friction} = \frac{gn^2|\bar{V}|\Delta t}{k^2\bar{R}^{4/3}}$$

$$\Delta Q_{losses} = \frac{\sum_i K_i |V_i| \Delta t}{2L}$$

where:

$\bar{A}$  = average cross-sectional flow area in the conduit,

$\bar{R}$  = average hydraulic radius in the conduit,

$\bar{V}$  = average flow velocity in the conduit,

$V_i$  = local flow velocity at location  $i$  along the conduit,

$K_i$  = local loss coefficient at location  $i$  along the conduit,

$H_1$  = head at upstream node of conduit,

$H_2$  = head at downstream node of conduit,

$A_1$  = cross-sectional area at the upstream end of the conduit,

$A_2$  = cross-sectional area at the downstream end of the conduit.

The equation solved for the head at each node is:

$$H_{t+\Delta t} = H_t + \frac{\Delta Vol}{(A_{store} + \sum As)_{t+\Delta t}} \quad (5)$$

where  $\Delta Vol$  is the net volume flowing through the node over the time step as given by:

$$\Delta Vol = 0.5[(\sum Q)_t + (\sum Q)_{t+\Delta t}] \Delta t$$

SWMM 4 solves equations (4) and (5) using the modified Euler method (equivalent to a 2<sup>nd</sup> order Runge-Kutta method). First Eq. (4) is solved for new flows in each conduit over a half time step  $\Delta t/2$  using the heads, areas, and velocities last computed for time  $t$ . The resulting flows are substituted into Eq. (5) to compute heads, using a time step of  $\Delta t/2$ .

Then full-step flows are found by evaluating Eq. (4) again, this time using the full time step  $\Delta t$  and using the heads, areas, and velocities found for the half-step solution. Finally, new heads for the full time step  $\Delta t$  are found by solving Eq. (5) once more with the full-step flows.

SWMM 5 solves equations (4) and (5) using a method of successive approximations with under relaxation. The procedure goes as follows:

1. A first estimate of flow in each conduit at time  $t + \Delta t$  is made by solving Eq. (4) using the heads, areas, and velocities found at the current time  $t$ . Then the same is done for heads by evaluating Eq. (5) using the flows just computed. These solutions are denoted as  $Q^{last}$  and  $H^{last}$ .
2. Eq. (4) is solved once again, using the heads, areas, and velocities that belong to the  $Q^{last}$  and  $H^{last}$  values just computed. A relaxation factor  $\Omega$  is used to combine the new flow estimate  $Q^{new}$ , with the previous estimate  $Q^{last}$  according to the equation  $Q^{new} = (1 - \Omega)Q^{last} + \Omega Q^{new}$  to produce an updated value of  $Q^{new}$ .
3. Eq. (5) is solved once again for heads, using the flows  $Q^{new}$ . As with flow, this new solution for head,  $H^{new}$ , is weighted with  $H^{last}$  to produce an updated estimate for heads,  $H^{new} = (1 - \Omega)H^{last} + \Omega H^{new}$ .
4. If  $H^{new}$  is close enough to  $H^{last}$  then the process stops with  $Q^{new}$  and  $H^{new}$  as the solution for time  $t + \Delta t$ . Otherwise,  $H^{last}$  and  $Q^{last}$  are replaced with  $H^{new}$  and  $Q^{new}$ , respectively, and the process returns to step 2.

In implementing this procedure, SWMM 5 uses a constant relaxation factor  $\Omega$  of 0.5, a convergence tolerance of 0.005 feet on nodal heads, and limits the number of trials to four.

#### Computation of Average Conduit Conditions

Evaluation of the flow updating Eq. (4) requires values for the average area ( $\bar{A}$ ), hydraulic radius ( $\bar{R}$ ), and velocity ( $\bar{V}$ ) throughout the conduit in question. Both SWMM 4 and 5 compute these values using the heads  $H_1$  and  $H_2$  at either end of the conduit from which corresponding flow depth values  $y_1$  and  $y_2$  can be derived. An average depth  $\bar{y}$  is then computed by averaging these values and is used with the conduit's cross-section geometry to compute the average area  $\bar{A}$  and hydraulic radius  $\bar{R}$ . The average velocity  $\bar{V}$  is found by dividing the most current flow value by the average area. SWMM 5 follows SWMM 4's practice of limiting this velocity to be no higher than 50 ft/sec in absolute value, so as not to allow the frictional flow adjustment term in Eq. (4) to become unbounded.

When the conduit has a free-fall discharge into either of its end nodes (meaning that the water elevation in the node is below the invert elevation of the conduit), the depth at that end of the conduit is set equal to the smaller of the critical depth and the normal flow depth for the current flow through the conduit.

### Computation of Surface Area

The surface area  $A_s$  that conduits contribute to their end nodes is computed the same way in both SWMM 4 and 5 and depends on the flow condition within the conduit. Under normal conditions it equals half the conduit's length times the average of the top width at the end- and mid-points of the conduit. These widths are evaluated before the next updated flow solution is found, using the flow depths  $y_1$ ,  $y_2$ , and  $\bar{y}$  discussed previously. If the conduit's inflow to a node is in free-fall (i.e., the conduit invert is above the node's water surface), then the conduit contributes nothing to the node's surface area.

For conduits with closed cross-sectional shapes (such as circular pipes) that are greater than 96 percent full, SWMM 4 utilizes a constant top width equal to the width when 96 percent full. This prevents the head adjustment term in Eq. (5) from blowing up as the actual top width and corresponding surface area go to 0 as the conduit approaches being full. This same practice is followed in SWMM 5.

Both programs assign a minimum surface area  $A_{store_{min}}$  to all nodes, including junctions that normally have no storage volume, to prevent Eq. (5) from becoming unbounded. The default value for this minimum area is 12.57 ft<sup>2</sup> (i.e., the area of a 4-foot diameter manhole) but can be overridden by a user-supplied value.

### Surcharge Conditions

SWMM defines a node to be in a surcharged condition when its water level exceeds the crown of the highest conduit connected to it. Under this condition the surface area contributed by any closed conduits would be zero and Eq. (3) would no longer be applicable. To accommodate this situation, SWMM uses an alternative nodal continuity condition, namely that the total rate of outflow from a surcharged node must equal the total rate of inflow,  $\sum Q = 0$ . By itself, this equation is insufficient to update nodal heads at the new time step since it only contains flows. In addition, because the flow and head updating equations for the system are not solved simultaneously, there is no guarantee that the condition will hold at the surcharged nodes after a flow solution has been reached.

To enforce the flow continuity condition, it can be expressed in the form of a perturbation equation:

$$\sum \left[ Q + \frac{\partial Q}{\partial H} \Delta H \right] = 0$$

where  $\Delta H$  is the adjustment to the node's head that must be made to achieve flow continuity. Solving for  $\Delta H$  yields:

$$\Delta H = \frac{-\sum Q}{\sum \partial Q / \partial H} \quad (6)$$

where from Eq. (4),

$$\frac{\partial Q}{\partial H} = \frac{-g \bar{A} \Delta t / L}{1 + \Delta Q_{friction} + \Delta Q_{losses}}$$

( $\partial Q / \partial H$  has a negative sign in front of it because when evaluating  $\Sigma Q$ , flow directed out of a node is considered negative while flow into the node is positive.)

Every time that Eq. (6) is applied to update the head at a surcharged node, Eq. (4) is re-evaluated to provide flow updates for the conduits that connect to the node. This process continues until some convergence criterion is met. SWMM 4 enters this iterative mode for surcharged nodes at both the half-step and full-step portions of its solution method. The user sets a convergence tolerance on the maximum fractional difference for flows found between iterations as well as the maximum number of iterations allowed. For SWMM 5, these surcharge iterations are folded into its normal set of iterations outlined previously. That is, whenever heads need to be computed in the successive approximation scheme, Eq. (6) is used in place of Eq. (5) if a node is surcharged, and no under-relaxation of the resulting head value is performed.

#### Normal Flow Condition

Both SWMM 4 and SWMM 5 limit the flow in non-surcharged conduits to be no greater than the normal Manning's flow for the current flow depth at the upstream end of the conduit whenever one of the following conditions occur:

1. The water surface slope is less than the conduit slope.
2. The Froude number, based on the water depth at either end of the conduit, is greater than 1.0.

Each condition indicates a flow regime that is supercritical. The user specifies which of these two criteria should apply.

#### Pumps, Orifices, and Weirs

Both programs model pumps, orifices, and weirs as links that connect a pair of nodes together. The flow through these links is computed as a function of the heads at their end nodes. These flows are computed during the flow evaluation step of both the SWMM 4 and 5 procedures after the flows through all of the conduits are computed.

SWMM 4 and 5 model pumps in a similar fashion, requiring the user to specify a pump curve along which the pump must operate. The pump curve can specify flow as a function of inlet node volume, inlet node depth, or the head difference between the inlet and outlet nodes. Both programs also limit the pump's flow to the inflow to the inlet node during a given time step should the pump curve flow be high enough to completely drain the inlet node during the time step.

SWMM 4 models an orifice (i.e., an enclosed opening oriented either vertically or horizontally to the flow direction) as an equivalent pipe. The length  $L$  of the equivalent pipe is computed as  $2.7 \sqrt{\gamma \Delta}$  where  $D$  is the height of the orifice opening. Its roughness coefficient is set equal to  $R^{2/3} / C_d \sqrt{2Lg}$  where  $R$  is the hydraulic radius of the full orifice opening and  $C_d$  is the discharge coefficient of the orifice. Flow through the orifice is then computed in the same fashion as for any conduit. SWMM 5 takes a more direct approach. It uses the classical orifice equation  $C_d A \sqrt{2gh}$  to compute flow when the orifice is fully submerged and a modified weir equation  $C_d A \sqrt{2gD} f^{1.5}$  when the orifice is submerged a fraction  $f$ . In these formulas,  $A$  is the area and  $D$  is the height of the full orifice opening, while  $h$  is the head across the orifice. Both programs compute a surface area contribution of the orifice to its end nodes, based on the equivalent pipe length  $L$  and the depth of water in the orifice.

SWMM 5 models weirs (i.e., an unrestricted opening oriented either transversely or parallel to the flow direction) in the same fashion as SWMM 4. An equation of the general form  $C_w L_w h^n$  is used to compute flow as a function of head  $h$  across the weir when the weir is not fully submerged.  $C_w$  is the weir's discharge coefficient,  $L_w$  is the length of its opening, and  $n$  is an exponent that depends on the type of weir being modeled (e.g., transverse, side-flow, V-notch, or trapezoidal). When the weir becomes completely submerged, both programs switch to using the orifice equation to predict flow as a function of the head across it. Weirs do not contribute any surface area to their end nodes.

### 3. Testing Procedure

The testing procedure used for this study involved running both SWMM 4 and 5 on an identical set of dynamic wave flow routing test problems and then comparing the results. Equivalent sets of analysis options, such as routing time step and minimum nodal surface area, were used with each program to maintain comparability (see below). The results produced by each program were inspected in the following ways:

- For examples that included a runoff calculation, the overall flow balances for runoff were compared to make sure that both versions of SWMM produced the same total inflow quantities to the flow routing computation.
- The flow balance error for the routing portion of each example was checked to insure that both versions of SWMM maintained acceptable flow continuity.
- Scatter plots were used to visually compare the peak flows computed for all conduits in each example by each of the programs.
- Time series plots of flows and water depths at critical locations in each example were visually compared, paying particular attention to any evidence of numerical instability exhibited by either program.

The critical locations chosen for time series plots typically included system outfalls, other significant system elements (such as orifices, weirs, storage units and pump stations), and locations that exhibited significant differences in peak flows between the two programs.

The test case examples used in this evaluation were divided into three distinct categories. The first category is the Extran Manual Test Cases. These consist of the ten Extran example data sets that were presented in the last SWMM 4.4 Users Manual (Roesner et al., 1992). They serve as a useful benchmark to compare against and model such elements as surcharged conduit flow, bottom and side orifices, weirs, storage units, pumps, and a variety of cross-sectional shapes.

The second test case category is the Challenge Test Cases. These are five examples from a suite of test cases compiled by Robert E. Dickinson of CDM. They all consist of several circular conduits connected in series that present different types of challenges to modeling dynamic flows, such as flat slopes, pipe constrictions, steep drops, adverse slopes, and inlet offsets.

The third test category is the User Submitted Test Cases. These contain five real-world data sets contributed by SWMM users. They include models of either storm sewer systems, combined sewer systems or natural channel systems and range in size from 59 conduits up to 273 conduits. Each of these user examples includes a runoff component that generates the flows supplied to the routing component of the model.

The versions of SWMM used in this comparison study were SWMM 4.4h (July 4, 2005) and SWMM 5.0.006 (September 2005). Unless otherwise indicated, the option settings listed in Table 3.1 were used in all runs to maintain computational compatibility between the two versions of SWMM. Note that the SWMM 4 ITMAX and SURTOL settings are not directly comparable to the SWMM 5 settings for maximum iterations and

convergence tolerance since the former apply only to surcharge iterations while the latter are used throughout SWMM 5's successive approximation routine.

**Table 3.1. Computational Settings Used for the Test Case Comparisons.**

<i>SWMM 4</i>			<i>SWMM 5</i>	
Setting	Meaning	Value	Setting	Value
ISOL	Solution method	0	Inertial terms	Keep
KSUPER	Normal flow limit criterion	0	Normal flow limit criterion	Slope
NEQUAL	Lengthen short conduits	0	Lengthen short conduits	No
AMEN	Minimum surface area, ft <sup>2</sup>	12.57	Minimum surface area, ft <sup>2</sup>	12.57
ITMAX	Maximum iterations (for surcharge only)	30	Maximum iterations (fixed internally)	4
SURTOL	Surcharge tolerance, expressed as a fractional flow difference	0.05	Convergence tolerance, expressed as an absolute head difference in feet (fixed internally)	0.005

## 4. Extran Manual Test Cases

### Example EXTRAN1

The drainage network used in this example is displayed in Figure 4.1. It contains 7 circular conduits arranged in 2 branches that converge into a pair of trapezoidal channels with a free outfall. Three locations as shown in the figure are subjected to the inflow hydrographs shown in Figure 4.2. The system was designed so that conduits 8040, 8060, and 1602 along the top branch become surcharged and flooding occurs at node 80608. It was analyzed using a 20 second time step over an 8 hour simulation period.

SWMM 4 and 5 produced essentially identical results for this example. Comparison plots for flow in selected conduits and water depth at selected nodes are shown in Figures 4.3 through 4.6. The maximum flow at each conduit and the maximum water elevation at each node are compared in Figures 4.7 and 4.8, respectively.

**EXAMPLE 1 OF EXTRAN MANUAL**

**Figure 4.1. Schematic of the Drainage Network Used for Example EXTRAN1.**

**Figure 4.2. External Inflows for Example EXTRAN1.**

**Figure 4.3. Flow Comparison for Link 1602 of Example EXTRAN1.**

**Figure 4.4. Flow Comparison for Link 1030 of Example EXTRAN1.**

**Figure 4.5. Water Depth Comparison for Node 82309 of Example EXTRAN1.**

**Figure 4.7. Comparison of Peak Flows (cfs) Computed for the Conduits in Example EXTRAN1.**

**Figure 4.8. Comparison of Maximum Water Elevations (ft) for the Nodes of Example EXTRAN1.**

### Example EXTRAN2

This example is identical to EXTRAN1 except that the free outfall at node 10208 is replaced with a fixed-elevation outfall that includes a tide gate. Again, the agreement between SWMM 4 and 5 is very good as shown in Figures 4.9 through 4.12.

**Figure 4.9. Flow Comparison for Link 1030 of Example EXTRAN2.**

**Figure 4.10. Water Depth Comparison for Node 16009 of Example EXTRAN2.**

**Figure 4.11. Comparison of Peak Flows (cfs) for the Conduits of Example EXTRAN2.**

**Figure 4.12. Comparison of Maximum Water Elevations (ft) for the Nodes of Example EXTRAN2.**

Example EXTRAN3

This example is also identical to EXTRAN1 except that a bottom circular orifice is placed between nodes 82309 and 15009 to eliminate upstream flooding. The modified network is shown in Figure 4.13, where the orifice has been labeled 90010.

**EXAMPLE 3 OF EXTRAN MANUAL**

**Figure 4.13. Schematic of the Drainage Network Used for Example EXTRAN3.**

Figure 4.14 compares the flow computed by SWMM 4 and SWMM 5 through the orifice while Figure 4.15 compares the depth of water above the orifice at its inlet node. Although the flow through the orifice is the same between the two programs, there is clearly a difference in the depth of water above the orifice opening. This can be attributed to the different ways in which each program models an orifice. SWMM 4 uses an equivalent pipe while SWMM 5 uses the classical orifice equation directly. However this difference does not appear to affect downstream conditions as evidenced by the comparison of flow in conduit 1570 shown in Figure 4.16 and the depth at node 15009 shown in Figure 4.17.

**Figure 4.14. Comparison of Flow Through the Bottom Orifice of Example EXTRAN3.**

**Figure 4.15. Comparison of Water Depth at the Inlet Node of the Orifice in Example EXTRAN3.**

**Figure 4.16. Flow Comparison for Link 1570 of Example EXTRAN3.**

**Figure 4.17. Water Depth Comparison for Node 15009 of Example EXTRAN3.**

**Figure 4.18. Comparison of Peak Flows (cfs) for the Conduits of Example EXTRAN3.**

**Figure 4.19. Comparison of Maximum Water Elevations (ft) for the Nodes of Example EXTRAN3.**

Example EXTRAN4

This example is identical to EXTRAN3, except that the bottom orifice 90010 is replaced by a transverse weir. The weir opening is 3-ft high by 3-ft long and its crest is 3-ft above the invert of Node 82309. Figure 4.20 compares the flow through the weir computed by SWMM 4 and SWMM 5 while Figure 4.21 compares the water depths at the weir's upstream node. The two programs produce nearly identical results. This was true as well for the remaining elements in the network. Figure 4.22 compares the maximum flow in all conduits and Figure 4.23 compares the maximum water elevations at all nodes.

**Figure 4.20. Comparison of Flow Through the Transverse Weir of Example EXTRAN4.**

**Figure 4.21. Comparison of Water Depth at the Inlet Node of the Weir in Example EXTRAN4.**

**Figure 4.22. Comparison of Peak Flows (cfs) for the Conduits of Example EXTRAN4.**

**Figure 4.23. Comparison of Maximum Water Elevations (ft) for the Nodes of Example EXTRAN4.**

### Example EXTRAN5

Example EXTRAN5 modifies EXTRAN1 by replacing the node downstream of the node that floods with a storage unit that has a side outlet orifice. The modified schematic is shown in Figure 4.24. Node 82309 was converted into a 40.5 ft. high storage unit with a constant 800 sq. ft. of surface area. A new node, 82308, was added to connect the outlet orifice to the original conduit 1602.

**EXAMPLE 5 OF EXTRAN MANUAL**

**Figure 4.24. Schematic of the Drainage Network Used for Example EXTRAN5.**

Figure 4.25 compares the orifice flows computed by both SWMM 4 and SWMM 5. With the exception of a few points in time, there is good agreement between the two programs even though the orifice is modeled differently by each. Figure 4.26 compares flows in conduit 1602 immediately downstream of the orifice. Whatever differences in flow that existed through the orifice have been essentially eliminated leaving almost perfect agreement between SWMM 4 and 5.

A comparison of the water depth at the storage unit node 82309 is shown in Figure 4.26. Depth comparisons for the nodes both immediately upstream and downstream of the storage node are shown in Figures 4.27 and 4.28, respectively. There is good agreement at all time points. Good agreement is also obtained for the peak flows and water elevations in all conduits and nodes as shown in Figures 4.29 and 4.30, respectively.

**Figure 4.25. Comparison of Flow Through the Outlet Orifice of Example EXTRAN5.**

**Figure 4.26. Comparison of Flow Through the Conduit Immediately Downstream of the Outlet Orifice of Example EXTRAN5.**

**Figure 4.27. Comparison of Water Depth at the Storage Node in Example EXTRAN5.**

**Figure 4.28. Comparison of Water Depth at the Node Immediately Downstream of the Storage Node in Example EXTRAN5.**

**Figure 4.29. Comparison of Peak Flows (cfs) for the Conduits of Example EXTRAN5.**

**Figure 4.30. Comparison of Maximum Water Elevations (ft) for the Nodes of Example EXTRAN5.**

### Example EXTRAN6

Example EXTRAN6 modifies EXTRAN1 by adding an off-line pumping station with wet well between nodes 82309 and 15009. The new wet well node, 82310, is connected to node 82309 by a new conduit 8061 which is 300 feet of 4-foot diameter pipe. The pump, link 90011, is represented by a Type 1 pump curve which describes pumping rate as a function of wet well volume. The highest point on this curve is 20 cfs at 1200 cubic feet. The latter number implicitly sets the maximum volume of the wet well node 82310. The resulting schematic of this network is displayed in Figure 4.31.

**EXAMPLE 6 OF EXTRAN MANUAL**

**Figure 4.31. Schematic of the Drainage Network Used for Example EXTRAN6.**

As shown in Figure 4.32, the flow through the pump computed by SWMM 4 and SWMM 5 is essentially the same. However, there is a significant difference in the way that the two programs handle the flow into the wet well coming from conduit 8061. SWMM 4 internally restricts the flow coming into the wet well so that the wet well does not flood. SWMM 5 allows the system to behave as designed, and allows the wet well to flood if more volume flows in than can be pumped. The resulting differences in the two programs are illustrated in Figures 4.33 and 4.34 which compares flow in conduit 8061, conduit 1602, and the flooding at the wet well node 82310. Figure 4.35 compares the flow in the outlet channel 1030 of this system. The mass balance report for SWMM 5 shows that the reduction in flow volume leaving the system as compared to SWMM 4 exactly equals the volume of flooding experienced at the pump's wet well.

**Figure 4.32. Comparison of Flow Through the Pump of Example EXTRAN6.**

**Figure 4.33. SWMM 4 Flows Leaving Node 82309 for Example EXTRAN6.**

**Figure 4.34. SWMM 5 Flows Leaving Node 82309 for Example EXTRAN6.**

**Figure 4.35. Comparison of Outfall Flows for Example EXTRAN6.**

Example EXTRAN7

This example replaces the off-line pump used in example EXTRAN6 with an in-line Type 2 pump directly connecting nodes 82309 and 15009 as shown in Figure 4.36. The operating curve for this pump, which relates pumping rate to water depth, is super-imposed on the figure.

**EXAMPLE 7 OF EXTRAN MANUAL**

**Figure 4.36. Schematic of the Drainage Network Used for Example EXTRAN7.**

Figure 4.37 compares the flow through the pump computed by both SWMM 4 and 5. Figure 4.38 does the same for the water depth at the pump's inlet node. SWMM 4 appears to have some flow instability at the pump when the inlet water depth falls to zero, while SWMM 5 produces a much smoother response. (Both programs limit the pumping rate to the inflow flow rate if the pump curve rate would cause the node to be pumped dry.) The overall higher pumping volume produced by SWMM 4 probably contributes to its larger continuity error (-6.87 percent) as compared to that of SWMM 5 (0.24 percent).

Looking downstream of the pump, the water depths at the pump outlet node 15009 are compared in Figure 4.39. SWMM 4 maintains a higher water depth at this node than does SWMM 5 after the inflow hydrograph has passed through due to the cycling of the pump. There is also an anomalously high depth at the start of the simulation with SWMM 4

which is difficult to explain. Even with these discrepancies, the final outfall flows through channel 1030 for the two programs are very close as shown in Figure 4.40. Also, the peak flows and maximum water elevations are essentially identical as shown in Figures 4.41 and 4.42, respectively.

**Figure 4.41. Comparison of Peak Flows (cfs) for the Conduits of Example EXTRAN7.**

**Figure 4.42. Comparison of Maximum Water Elevations (ft) for the Nodes of Example EXTRAN7.**

### Example EXTRAN8

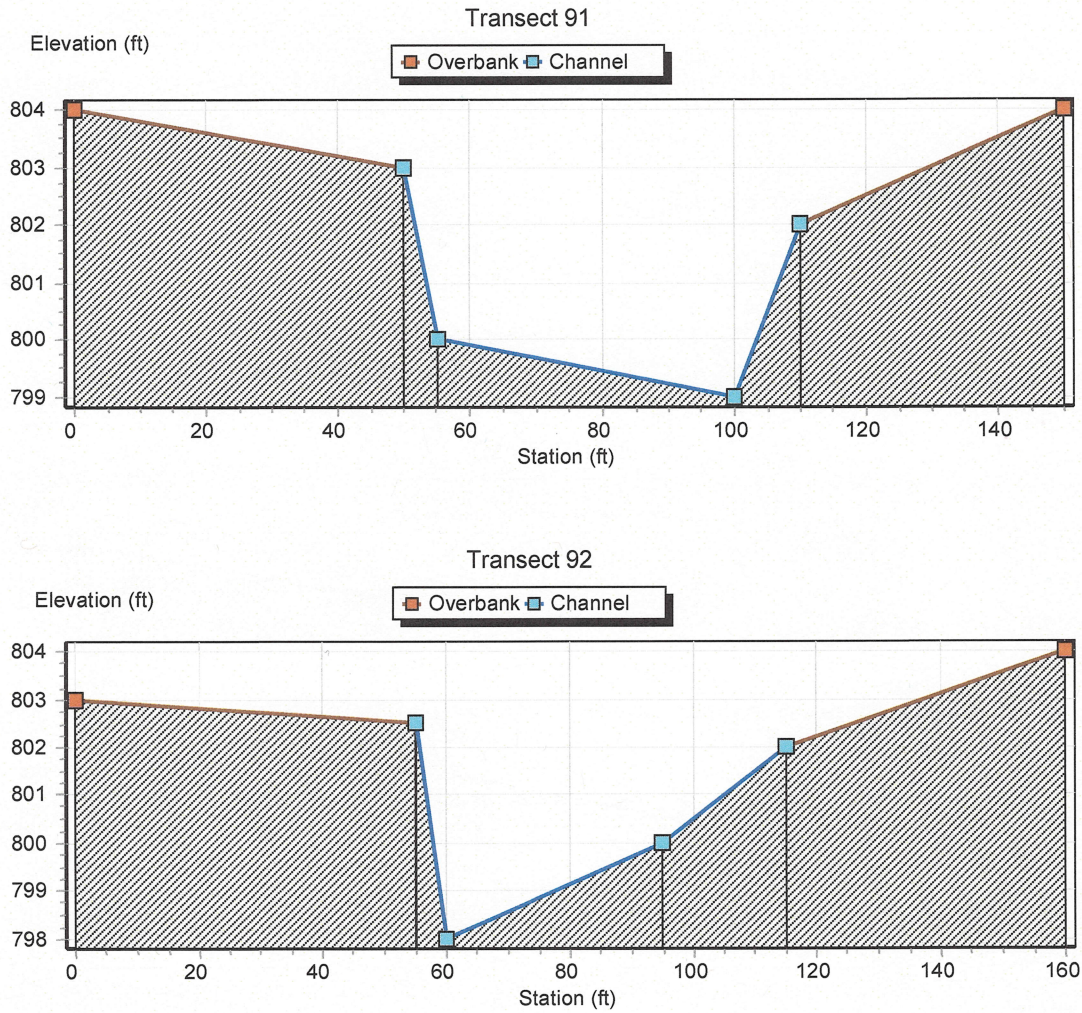

The schematic for example EXTRAN8 is shown in Figure 4.43. This example utilizes various cross-sectional shapes for its conduits as listed in Table 4.1. The geometries of the two irregular-shaped channels, 10081 and 10082, are depicted in Figure 4.44.

**Figure 4.43. Schematic of the Drainage Network Used for Example EXTRAN8.**

**Table 4.1. Cross-Sectional Shapes Used in Example EXTRAN8.**

<i>Conduit</i>	<i>Shape</i>
10001	Circular
10002	Rectangular
10003	Horseshoe
10004	Egg
10005	Baskethandle
10006	Trapezoidal
10007	Parabolic
10081	Irregular
10082	Irregular

**Figure 4.44. Geometry of Channels 10081 and 10082 in Example EXTRAN8.**

The inflows at nodes 30001, 30004, and 30007 are all triangular hydrographs with a base time of 1 hour and peak flow of 15 cfs, 18 cfs, and 9 cfs, respectively. The inflow at node 30081 is a constant 20 cfs. The water surface elevation at the outfall node 30083 is a fixed value. Following the protocol used in the SWMM 4 Extran Manual, this example was first run for a 1-hour duration with just the constant 20 cfs inflow to create a hot start file with the two natural channels 10081 and 10082 flowing at 20 cfs. Then the system was run using this hot start file and the three inflow hydrographs for a period of 2 hours. The results at selected locations are depicted in Figures 4.45 – 4.50 and show perfect agreement between the two programs.

**Figure 4.45. Flow Comparison for Link 10003 of Example EXTRAN8.**

**Figure 4.49. Comparison of Peak Flows (cfs) for the Conduits of Example EXTRAN8.**

**Figure 4.50. Comparison of Maximum Water Elevations (ft) for the Nodes of Example EXTRAN8.**

### Example EXTRAN9

This example illustrates hydrograph routing through a variable-area storage unit with a side outlet orifice discharging to a free outfall. A schematic of the system is shown in Figure 4.51. The inflow hydrograph is triangular with a 5 hour time base and peak flow of  $1.2 \text{ m}^3/\text{s}$ . The storage unit is shaped as shown in Figure 4.52. Comparisons of SWMM 4 and SWMM 5 results for depth in the storage unit and outflow through the orifice are shown in Figures 4.53 and 4.54, respectively. The results from the two programs are essentially the same.

**Figure 4.53. Water Depth Comparison for the Storage Unit of Example EXTRAN9.**

**Figure 4.54. Flow Comparison for the Side Orifice of Example EXTRAN9.**

### Example EXTRAN10

This example illustrates a 5-pump pumping station that moves water up a 50-foot hill from one storage unit to another. The schematic is shown in Figure 4.55. Each pump is a Type 3 pump that all share the same operating curve as shown in Figure 4.56. However each pump has a different operating range as shown in Table 4.2. These ranges are entered directly on the H1 lines of the SWMM 4 input data file and are converted into a set of Control Rules for the SWMM 5 input. As an example, the operating condition for pump 9002 can be expressed through the following set of control rules in SWMM 5:

**Figure 4.55. Schematic of Example EXTRAN10.**

**Figure 4.56. Operating Curve for Pumps of Example EXTRAN 10**

**Table 4.2. Operating Ranges for the Pumps of Example EXTRAN10 (Pump turns on when clear well depth exceeds high level and shuts down when depth reaches low level.)**

<i>Pump</i>	<i>Low Level (feet)</i>	<i>High Level (feet)</i>
90002	2	6
90003	3	7
90004	4	8
90005	5	9
90006	6	10

```

RULE 90002A
IF NODE 401 DEPTH >= 6
AND PUMP 90002 STATUS = OFF
THEN PUMP 90002 STATUS = ON

```

```

RULE 90002B
IF NODE 401 DEPTH <= 2
AND PUMP 90002 STATUS = ON
THEN PUMP 90002 STATUS = OFF

```

The upstream storage unit 401 is subjected to an external inflow that ramps up from 0 to 100 cfs over a period of an hour after which it remains constant at this rate. The system was solved using a 1 minute time step over a total duration of 5 hours.

Figures 4.57 and 4.58 compare water depths in the two storage units computed by both SWMM 4 and SWMM 5. Figure 4.59 compares the outflow rate from the system through conduit 100. These figures show almost perfect agreement between SWMM 4 and 5. As for the 5 pumps, 90002, 90005, and 90006 also show almost perfect agreement. As an example, the flow for 90002 is shown in Figure 4.60. There are some differences in flow for Pumps 90003 and 90004 at 40 minutes into the simulation, as shown in Figure 4.61 for pump 90004. Table 4.3 compares the pump flows at 40 minutes for the two programs. For the three pumps that are on, 90002, 90003, and 90004, SWMM 5 produces the same flow rate which should be the case since each pump has the same operating curve and end nodes. SWMM 4, however, produces slightly different flow rates, suggesting that something is not quite right with how its computing pump flows.

**Table 4.3. Pumping Rates for Example EXTRAN10 at Elapsed Time of 40 Minutes**

<i>Pump</i>	<i>SWMM 5 Flow (cfs)</i>	<i>SWMM 4 Flow (cfs)</i>
90002	25.7	23.0
90003	25.7	22.5
90004	25.7	21.0
90005	0	0
90006	0	0

## 5. Challenge Test Cases

### Example TEST1

The first challenge example compares the two programs in modeling a flat run of pipe. The profile of the pipe layout is displayed in Figure 5.1. It consists of ten, 100-foot lengths of 4-foot diameter circular pipe placed on a flat (0%) slope. The system was subjected to a 3-hour square wave inflow hydrograph of 100 cfs magnitude at the upstream end and was run for a 5 hour simulation period using a 5 second routing time step (larger time steps caused instability in both programs).

Figure 5.2 compares flows produced by SWMM 4 and 5 in selected conduits while Figure 5.3 does the same for depth at selected nodes. Overall there is a very good agreement between the two programs, with SWMM 5 providing a slightly more stable solution for depth than SWMM 4.

**Figure 5.1. Profile View of Example TEST1.**

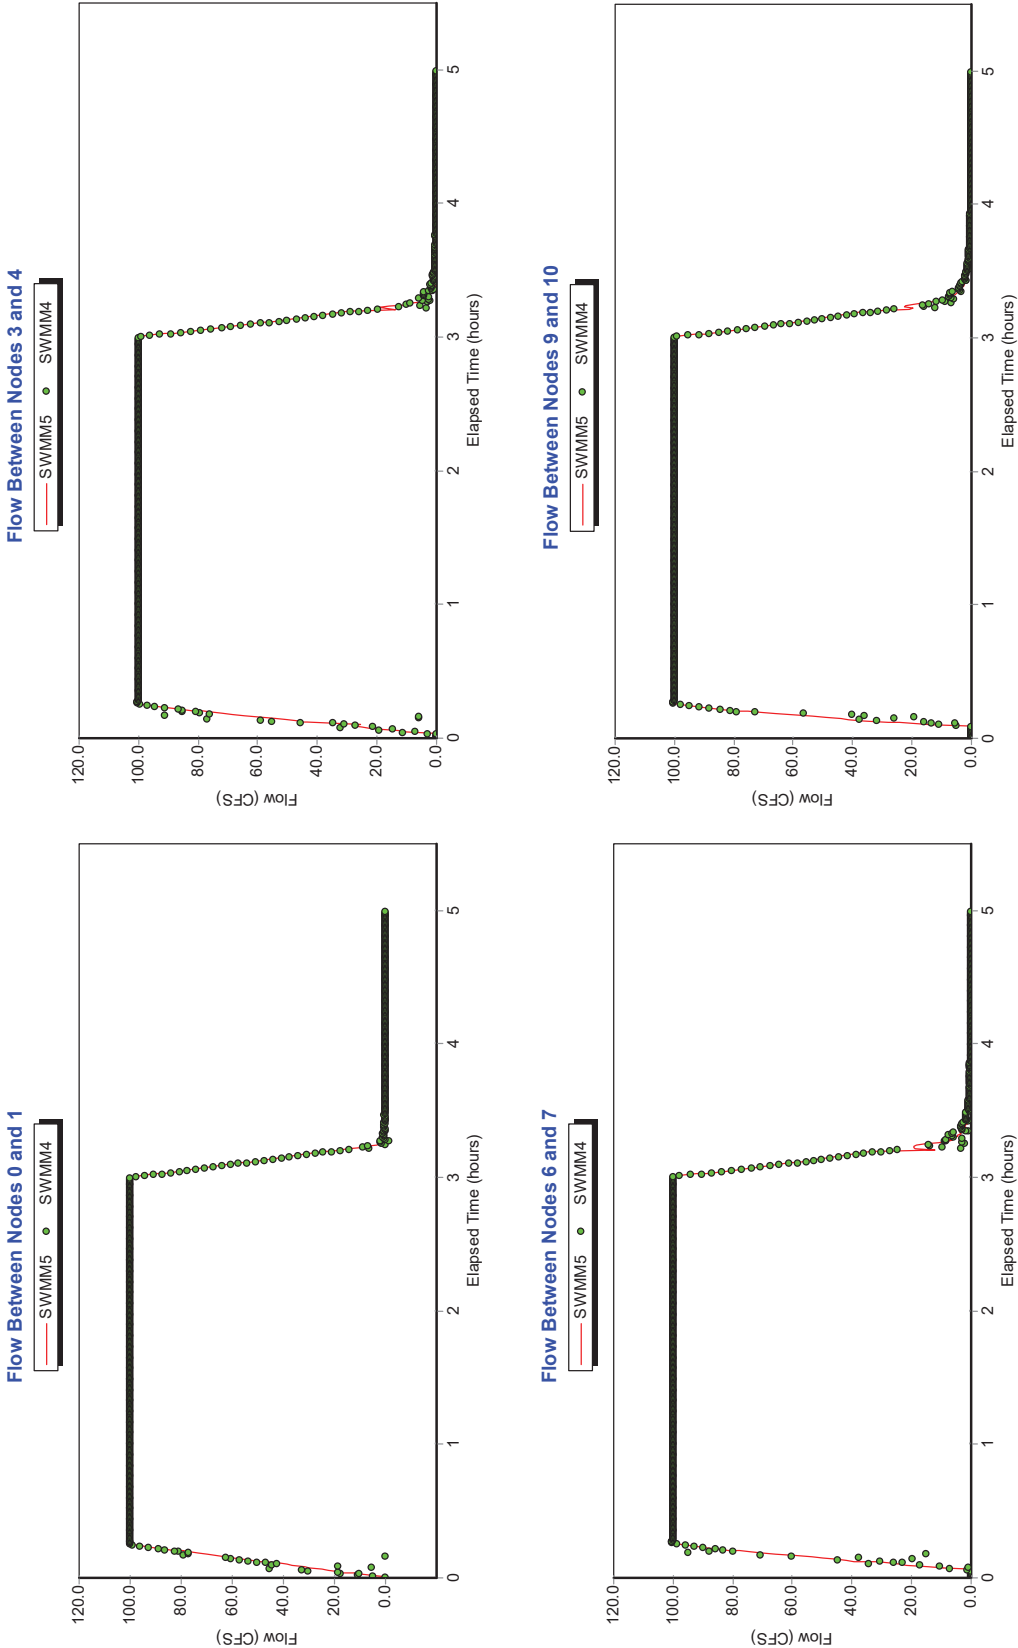

Figure 5.2. Flow Comparisons for Selected Conduits for Example TEST1.

Figure 5.3. Depth Comparisons for Selected Nodes for Example TEST1.

Example TEST2

The next challenge test example models a pipe constriction that is subjected to surcharging. The profile of the system is shown in Figure 5.4. It consists of alternating sections of 12-foot diameter circular pipe flowing into a 3-foot diameter pipe. Each section is 1000 feet long and has a slope of 0.05%. The inflow hydrograph to the system is a 50 cfs, 3-hour square wave pattern as is shown in Figure 5.5. The system was run for a 6-hour duration using a 5 second routing time step.

**Figure 5.4. Profile View of Example TEST2.**

**Figure 5.5. Inflow Hydrograph for Example TEST2.**

Comparisons of flow for various links are displayed in Figure 5.6 while those for water depths in various nodes are given in Figure 5.7. Note how much the constriction influences the shape of the inflow hydrograph as it moves downstream. SWMM 4 has the upstream pipe segments reaching a surcharged state about 10 minutes faster than does SWMM 5 and shows a slightly higher degree of flow oscillation in the large 12-foot pipe between nodes 3 and 4. The flow continuity error for both programs was 0.4%.

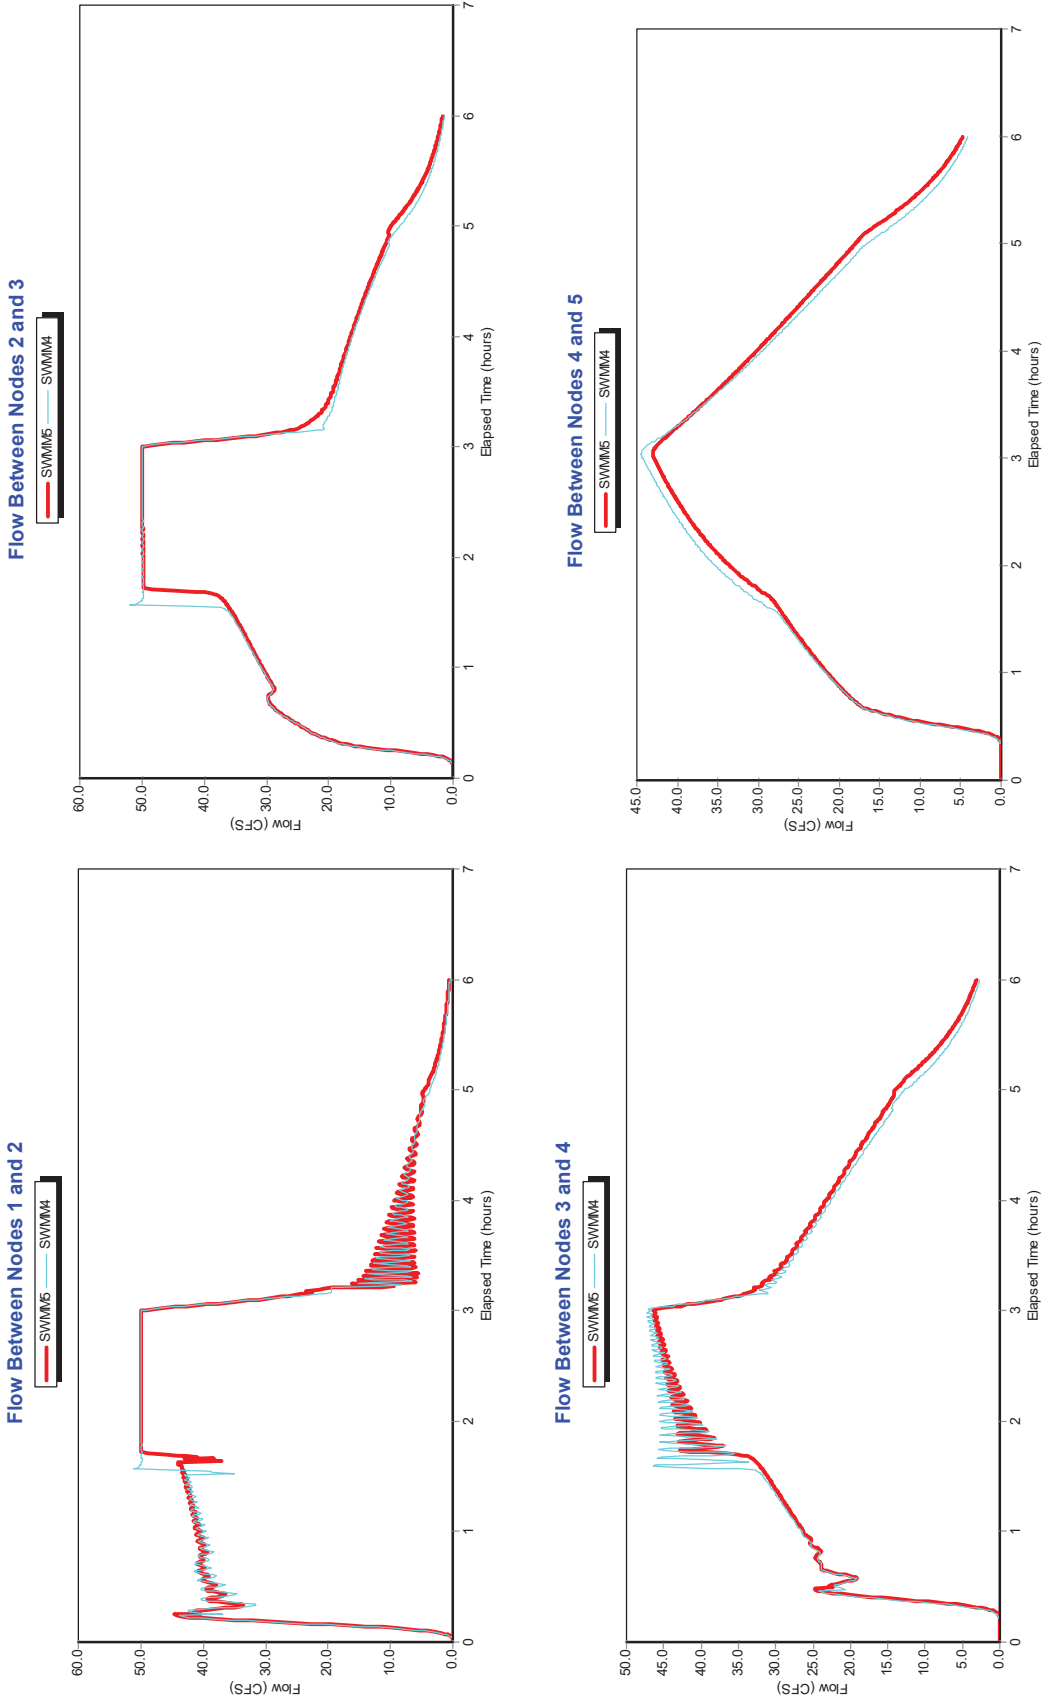

Figure 5.6. Comparisons of Flow in Selected Conduits of Example TEST2.

Figure 5.7. Water Depth Comparisons for Selected Nodes of Example TEST2.

Example TEST3

This example consists of six sections of 6-foot diameter circular pipe that drop 40 feet to connect with another six sections of 3-foot diameter pipe. Each section is 500 feet long with a slope of 0.10%. The profile for this example is shown in Figure 5.8 and the inflow hydrograph is shown in Figure 5.9. Both SWMM 4 and 5 were run at a 5 second routing time step over a 6 hour simulation period.

**Figure 5.8. Profile View of Example TEST3.**

**Figure 5.9. Inflow Hydrograph (cfs) for Example TEST3.**

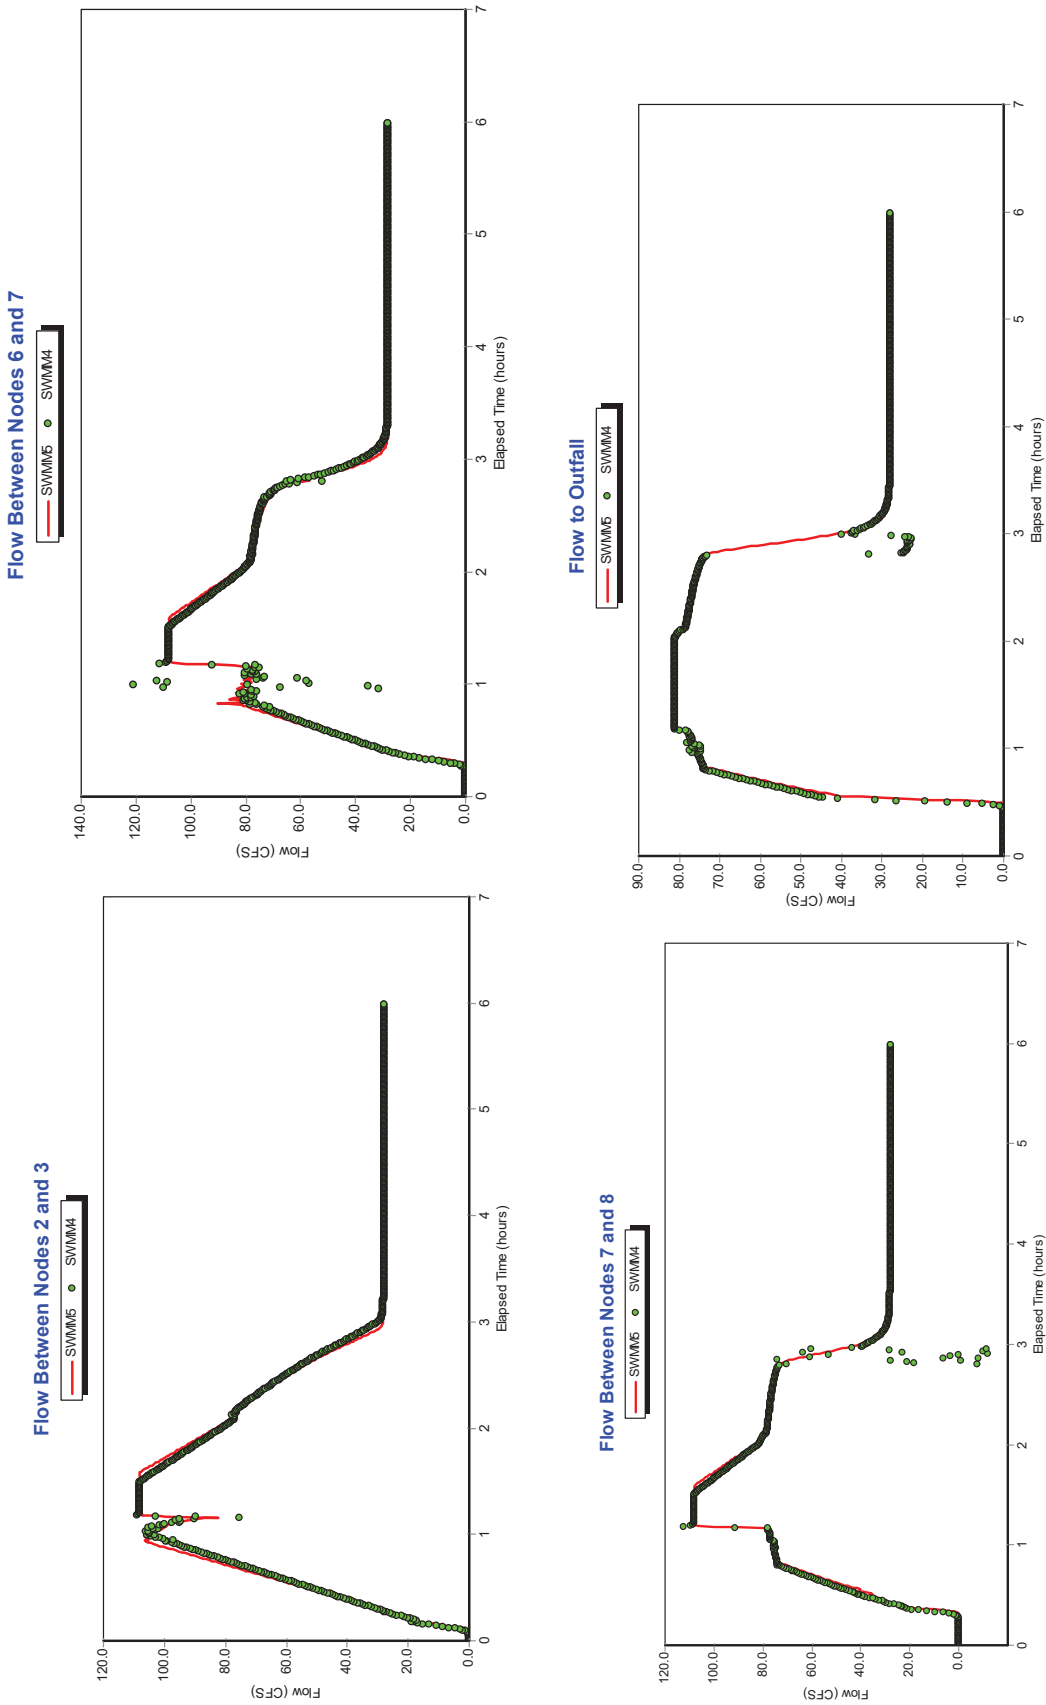

Figure 5.10. Comparisons of Flow in Selected Conduits of Example TEST3.

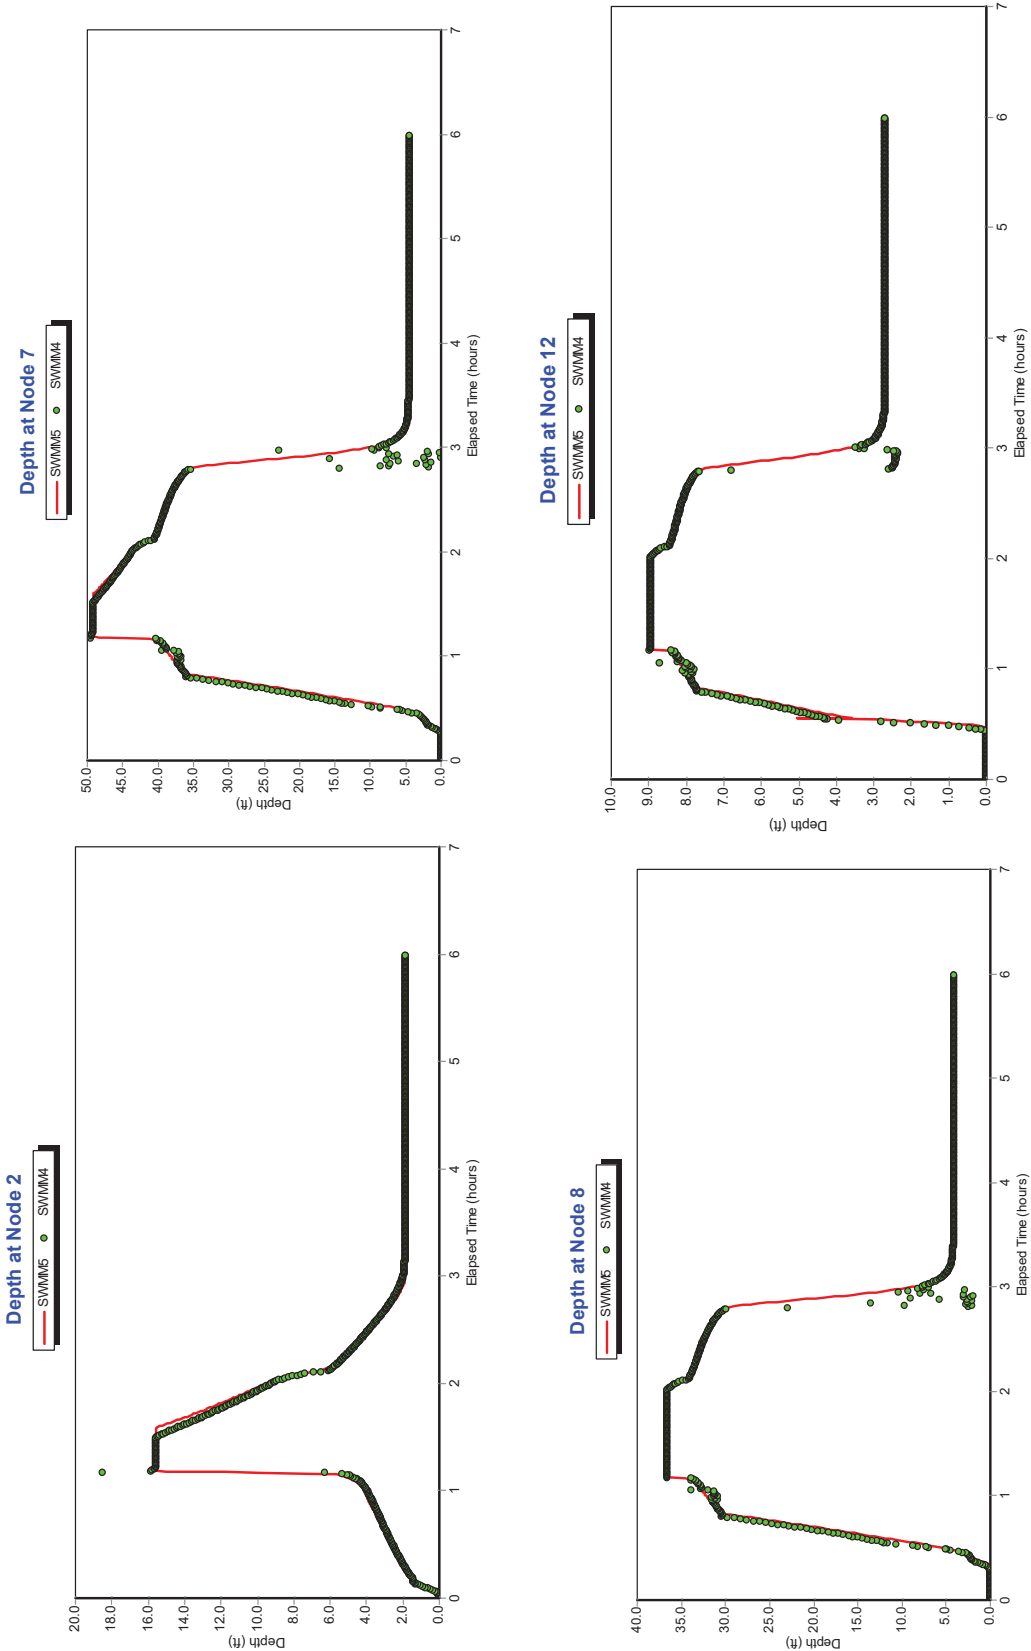

Figure 5.11 Water Depth Comparisons for Selected Nodes of Example TEST3.

Figure 5.10 shows flow comparisons between SWMM 4 and 5 at selected conduits while Figure 5.11 does the same for node water depth. Overall, the shapes of the hydrographs and the depth profiles look similar. SWMM 4 exhibits some instabilities for short periods of time, particularly around the drop location, that are not present with SWMM 5. Figure 5.12 illustrates what happens at the outfall when the routing time step is increased from 5 to 30 seconds. SWMM 5 is still able to produce a stable solution while SWMM 4 becomes highly unstable. The system flow continuity errors at this larger time step were 0.02 percent for SWMM 5 and 34.4 percent for SWMM 4.

**Figure 5.12. Outfall Flow Comparison for Example TEST3 at a 30 Second Time Step.**

### Example TEST4

Example TEST4 is an inverted siphon. The profile is shown in Figure 5.12. All conduits are 100-foot lengths of 4-foot diameter circular pipe. The inflow hydrograph, shown in Figure 5.13, is a 3-hour square wave of 100 cfs magnitude. SWMM 4 and 5 were run using a 5 second time step for a period of 5 hours.

**Figure 5.12. Profile View of Example TEST4.**

**Figure 5.13. Inflow Hydrograph (cfs) for Example TEST4.**

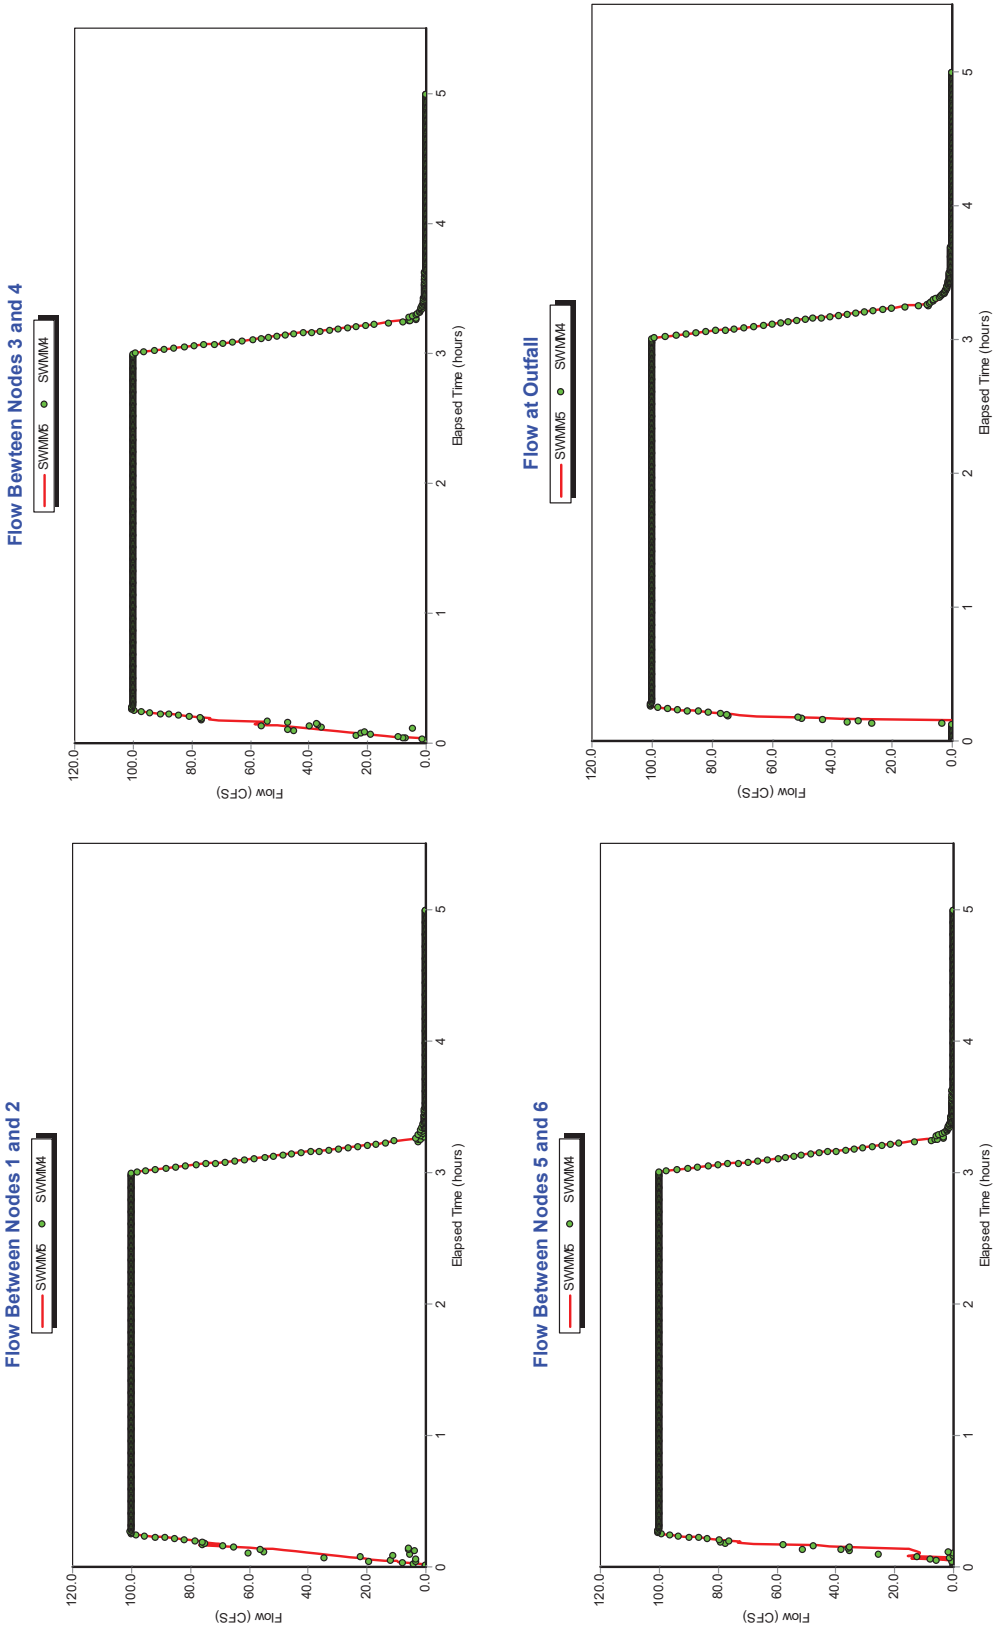

Figure 5.14. Comparisons of Flow in Selected Conduits of Example TEST4.

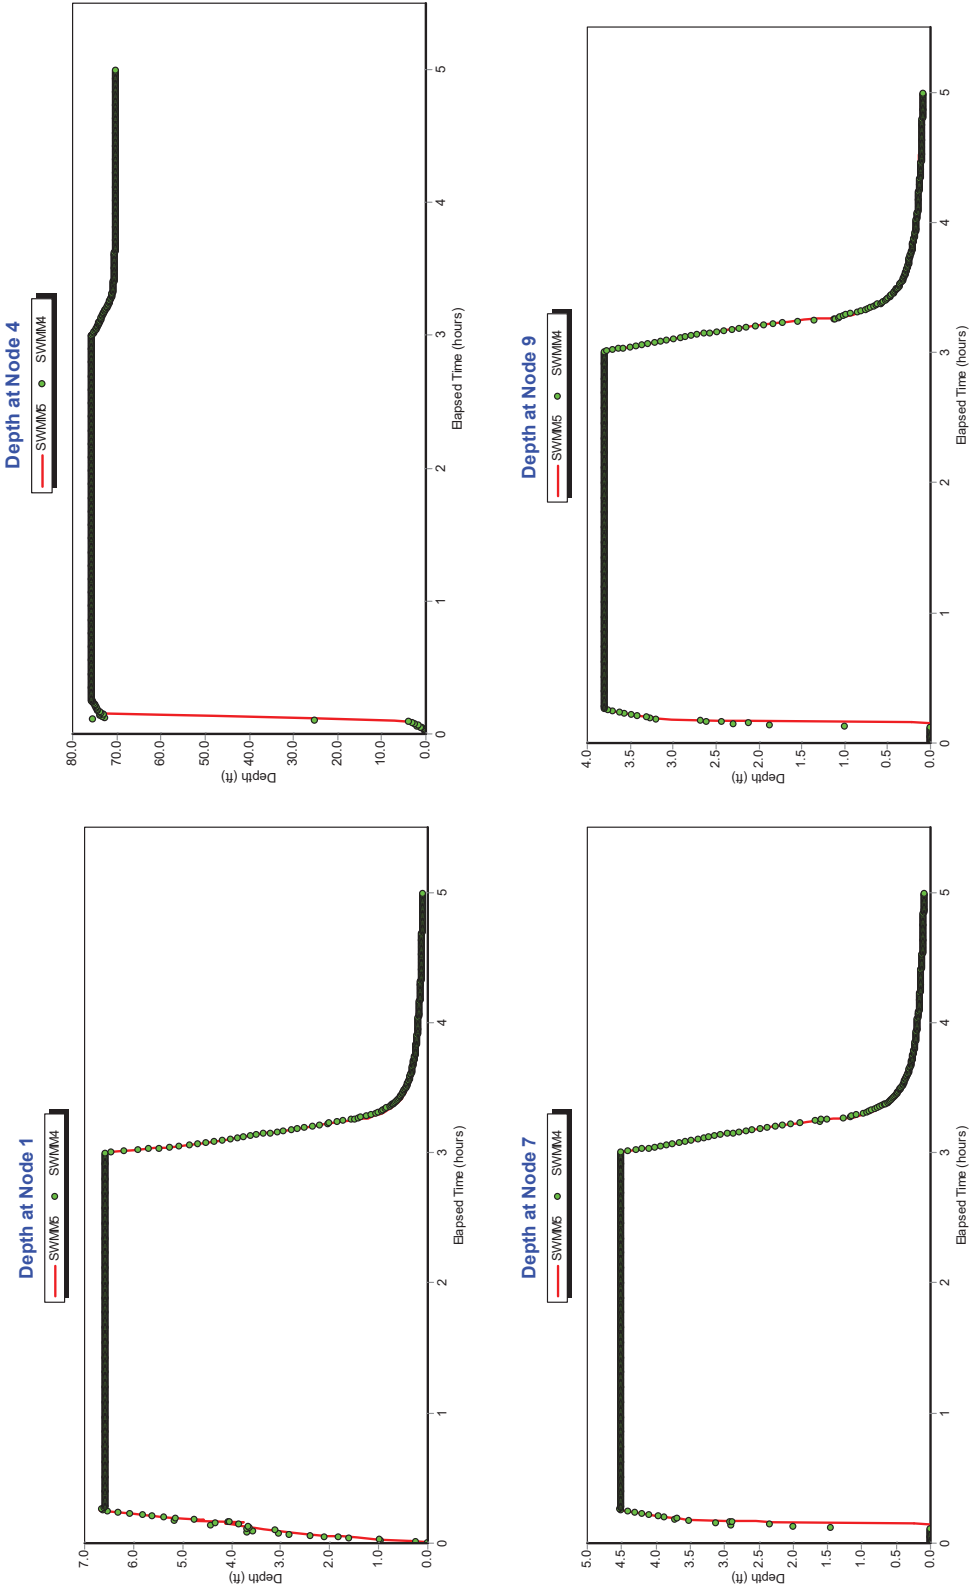

Figure 5.15. Water Depth Comparisons for Selected Nodes of Example TEST4.

Comparisons of flows in selected conduits are shown in Figure 5.14 while those for depths at selected nodes are shown in Figure 5.15. There is very good agreement between the two programs. Figure 5.16 illustrates what happens at the outfall when the routing time step is increased to 10 seconds. The solution produced by SWMM 4 becomes highly unstable at this time step while SWMM 5 still produces reasonable results.

**Figure 5.16. Outfall Flow Comparison for Example TEST4 at a 10 Second Time Step.**

### Example TEST5

The final challenge test example is a sequence of conduits each of which has a 3-foot offset from the invert of its inlet node. Each conduit is a 100-foot length of 4-foot diameter circular pipe at a 3% slope. The profile of this layout is shown in Figure 5.17. The inflow hydrograph applied at the upstream end of this system is shown in Figure 5.18. SWMM 4 and 5 were run using a 5 second time step for a period of 12 hours.

02/22/2002 00:21:00

**Figure 5.17. Profile View of Example TEST5.**

**Figure 5.18. Inflow Hydrograph (cfs) for Example TEST5.**

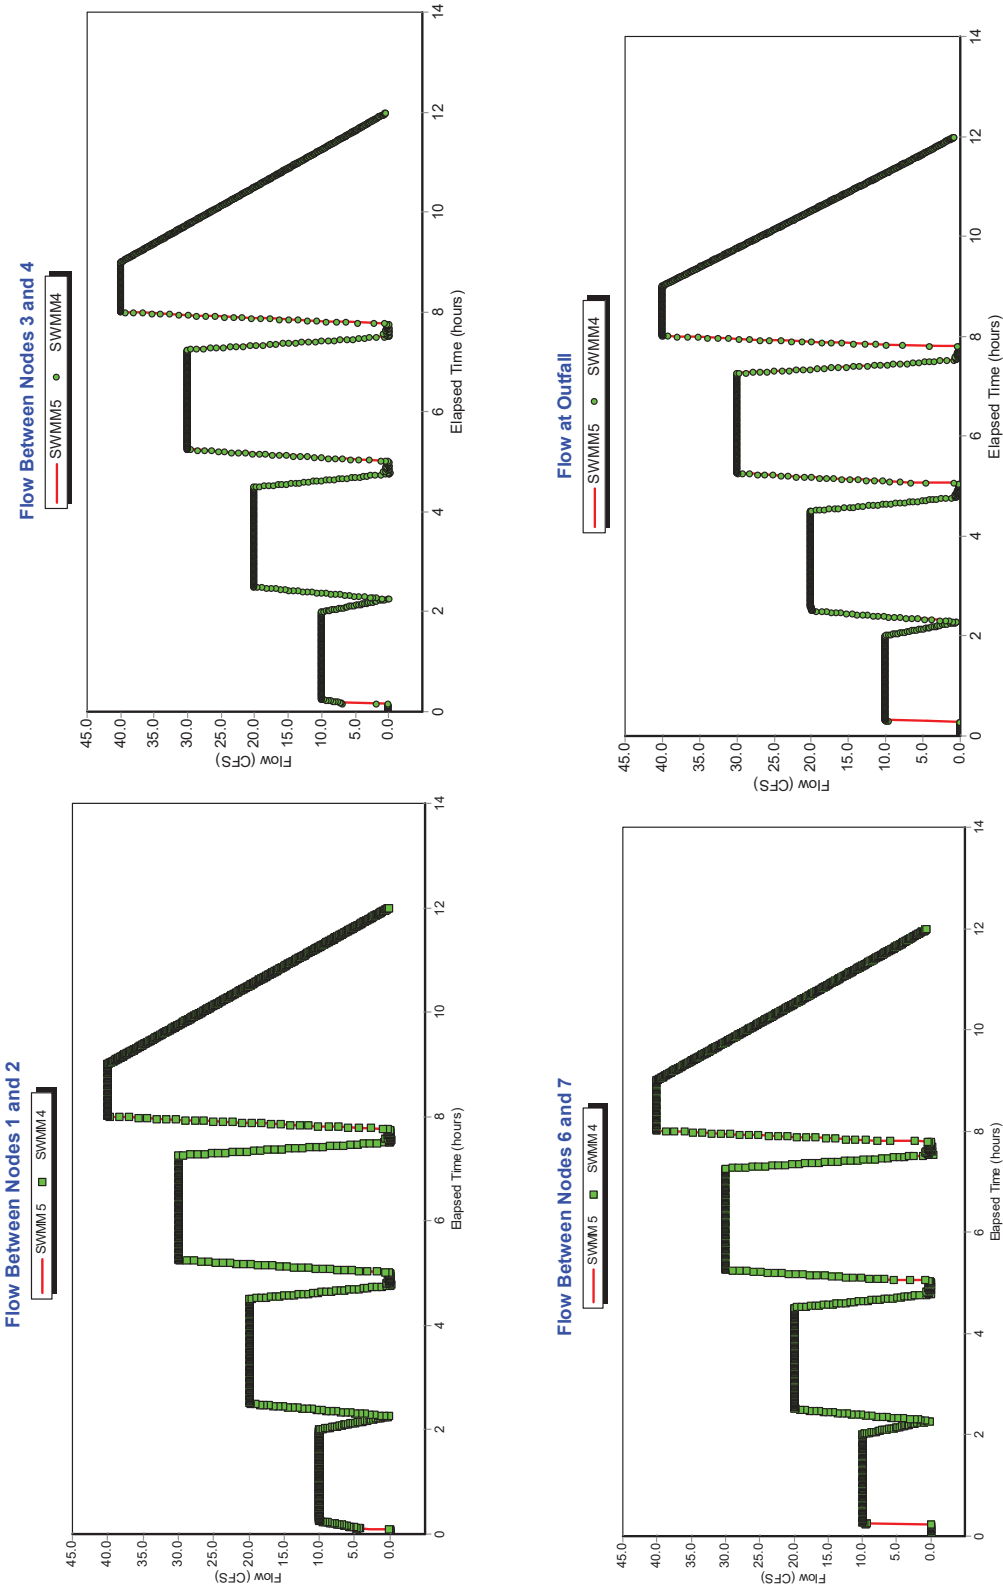

Figure 5.19. Comparisons of Flow in Selected Conduits of Example TEST5.

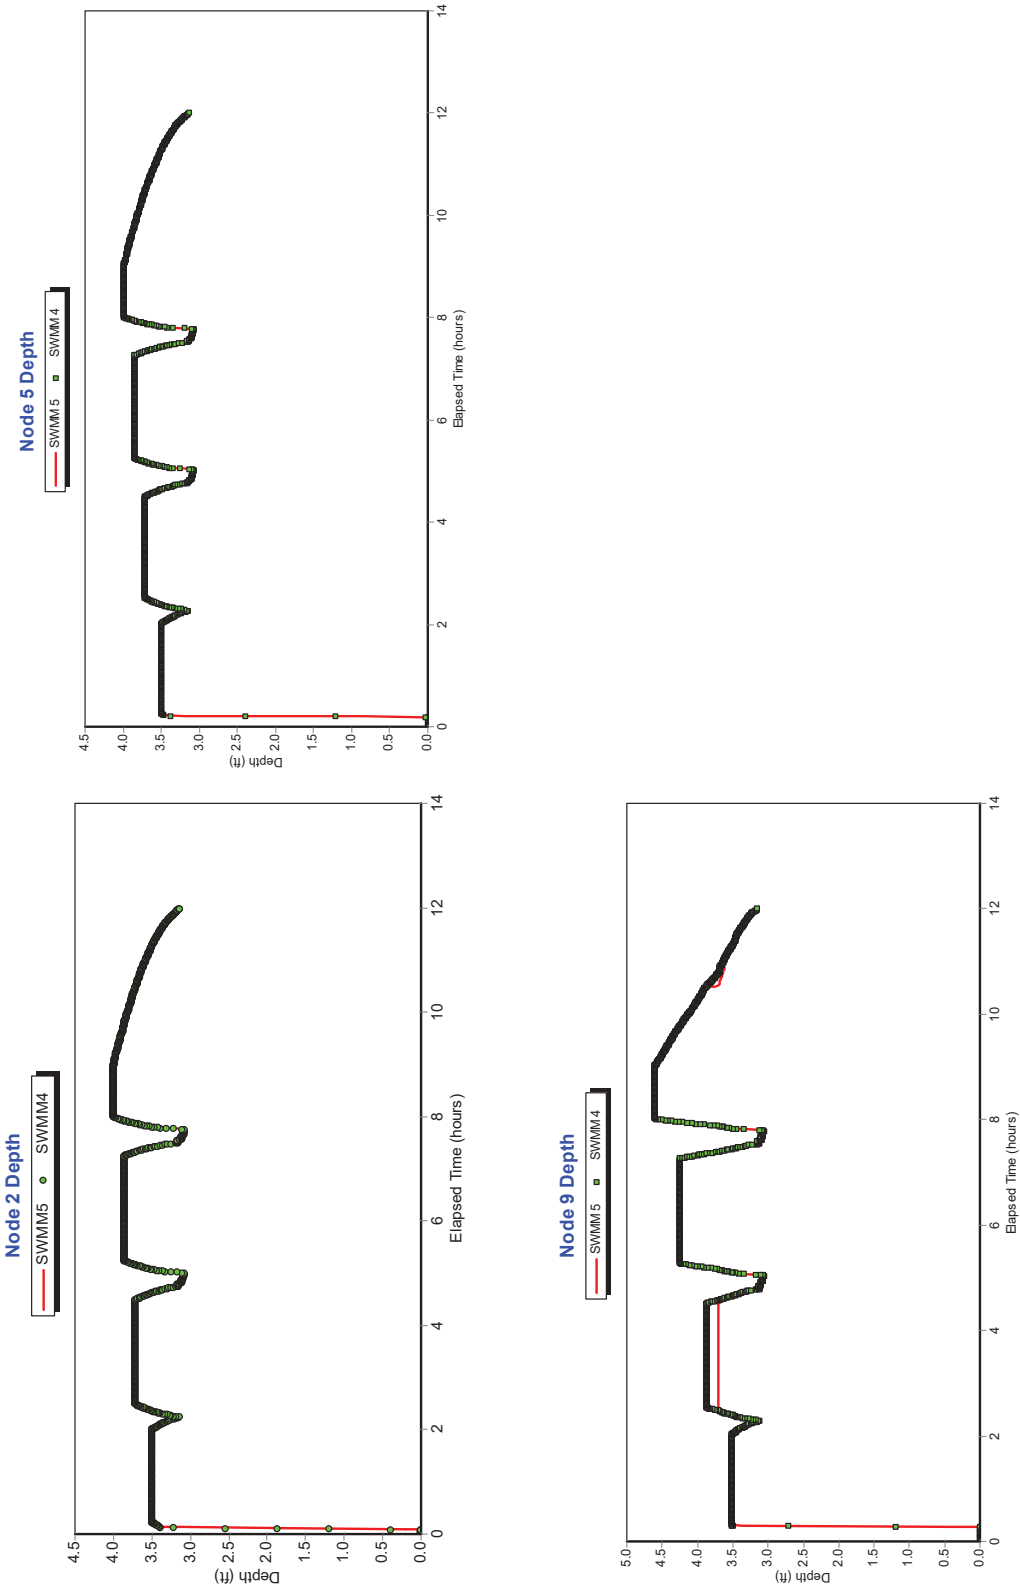

Figure 5.20. Water Depth Comparisons for Selected Nodes of Example TEST5.

Figure 5.19 shows flow comparisons between SWMM 4 and 5 at selected conduits while Figure 5.20 does the same for node water depth. The results are seen to be identical between the two programs. When the routing time step is increased to 10 seconds, the SWMM 5 solution remains the same while SWMM 4 becomes highly unstable. Figure 5.21 illustrates this result by comparing outfall flows between the two programs run at the higher time step. The system flow continuity error for SWMM 4 was greater than 800 percent compared with only 0.05 percent for SWMM 5.

**Figure 5.21. Outfall Flow Comparison for Example TEST5 at a 10 Second Time Step.**

## 6. User-Supplied Test Cases

### Example USER1

Example USER1 consists of a 175 hectare drainage area divided into 58 subcatchments. As shown in Figure 6.1, the conveyance system contains 59 circular conduits connected to 59 junctions and a single outfall. The elevation profile of the main stem drops almost 19 meters over a distance of 2.5 km (see Figure 6.2). The storm event used for the simulation is depicted in Figure 6.3. The system was solved using a 5 second flow routing time step for a 7 hour duration with a 1 minute reporting time step.

**Figure 6.1. Schematic of the Drainage Network for Example USER1.**

**Figure 6.2. Elevation Profile of the Main Stem of the Drainage Network for Example USER1.**

**Figure 6.3. Rainfall Hyetograph for the Design Storm Used for Example USER1.**

Table 6.1 compares the runoff computation made by both SWMM 5 and SWMM 4 for this example. SWMM 5 produces slightly more runoff than does SWMM 4 and has a smaller continuity error. Figure 6.4 compares the peak flows estimated by both SWMM 5 and SWMM 4 for all conduits in this example. SWMM 4 tends to produce slightly higher peaks than SWMM 5 but the average difference is only 2.2%. Comparisons for flows at selected locations are displayed in Figure 6.5. These locations include the outfall and conduits 13, 23, and 64 which are all identified on the system schematic in Figure 6.1. The plots show an almost perfect match between SWMM 4 and 5. Comparisons were also made of water depths at nodes 05y32, 05y36, 05y41, and 05y44 whose locations are also identified in the schematic of Figure 6.1. These results are shown in Figure 6.6. The SWMM 5 depths match those of SWMM 4 very well except for the peak time at node 05y44. The peak SWMM 4 depth here is about a meter higher than that of SWMM 5. However, it appears that this might be a result of some numerical instability in the SWMM 4 solution and not a true difference.

**Table 6.1. System-Wide Runoff Results for Example USER1.**

	<i>SWMM 5</i>	<i>SWMM 4</i>
Precipitation (mm)	26.448	26.360
Evaporation (mm)	0.000	0.000
Infiltration (mm)	7.257	7.243
Runoff (mm)	19.189	18.461
Final Storage (mm)	0.097	0.121
Continuity Error (%)	-0.358	2.028

**Figure 6.4. Comparison of Peak Flows (cms) for All Conduits in Example USER1.**

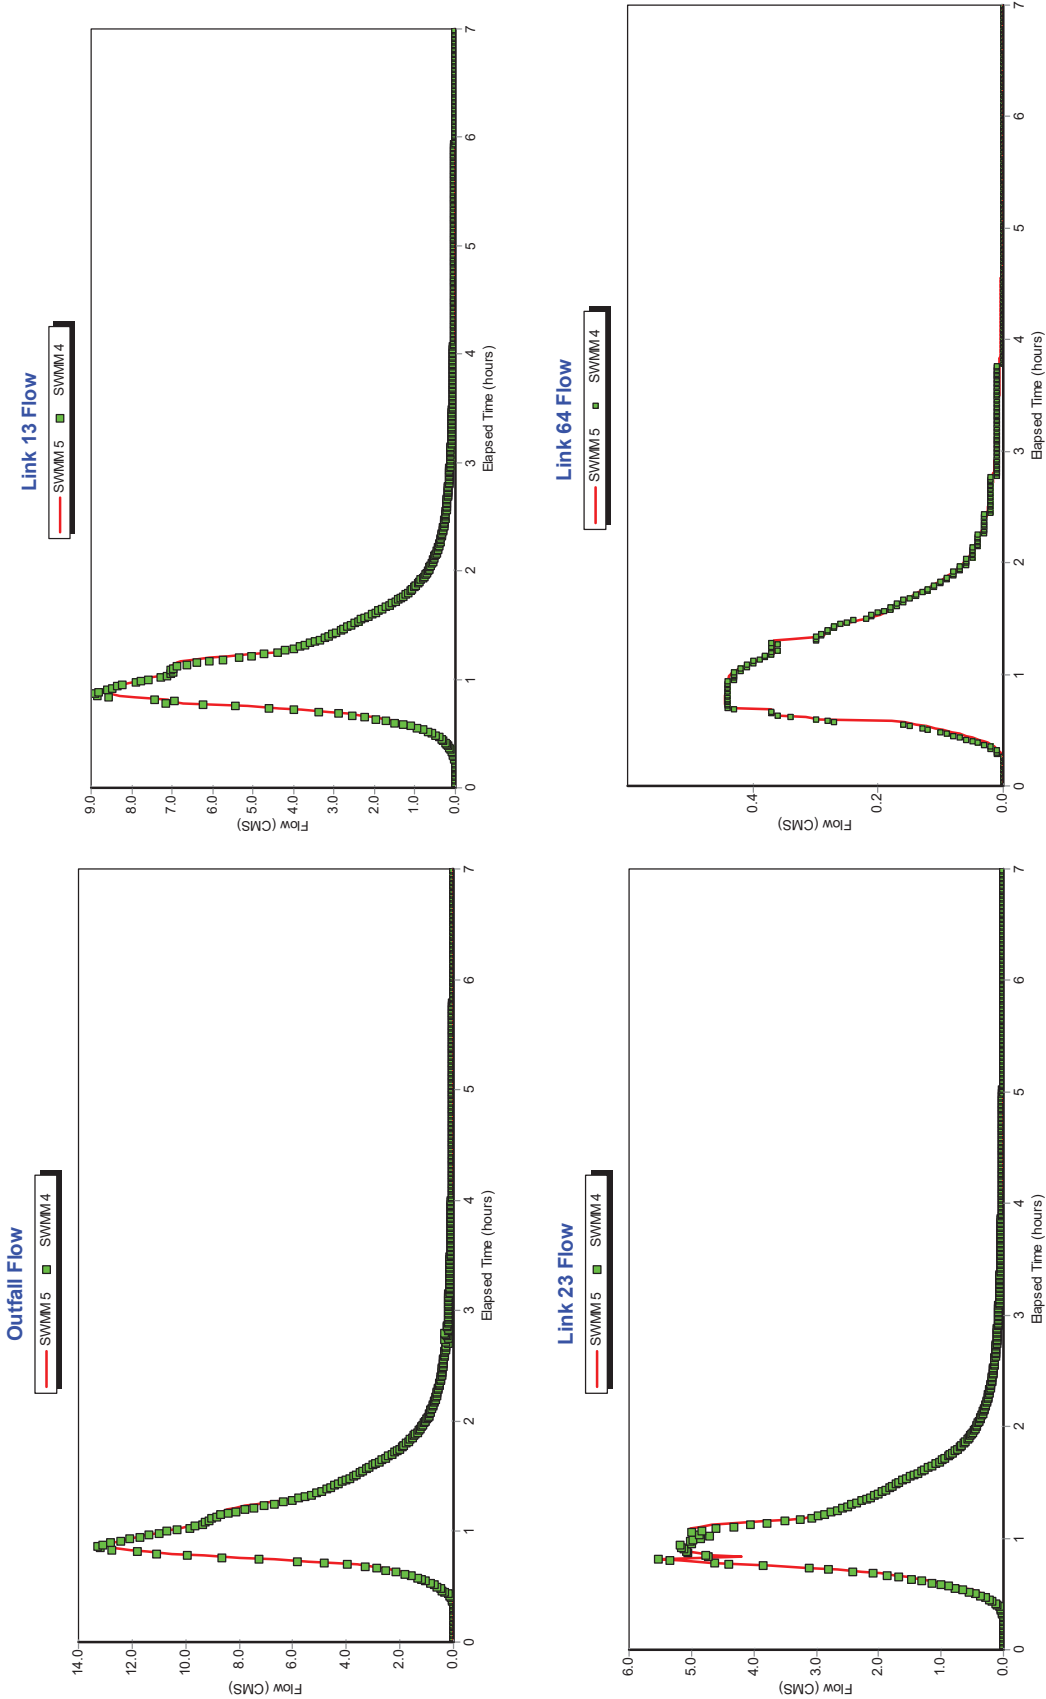

Figure 6.5. Comparison of Flows at Select Locations for Example USER1.

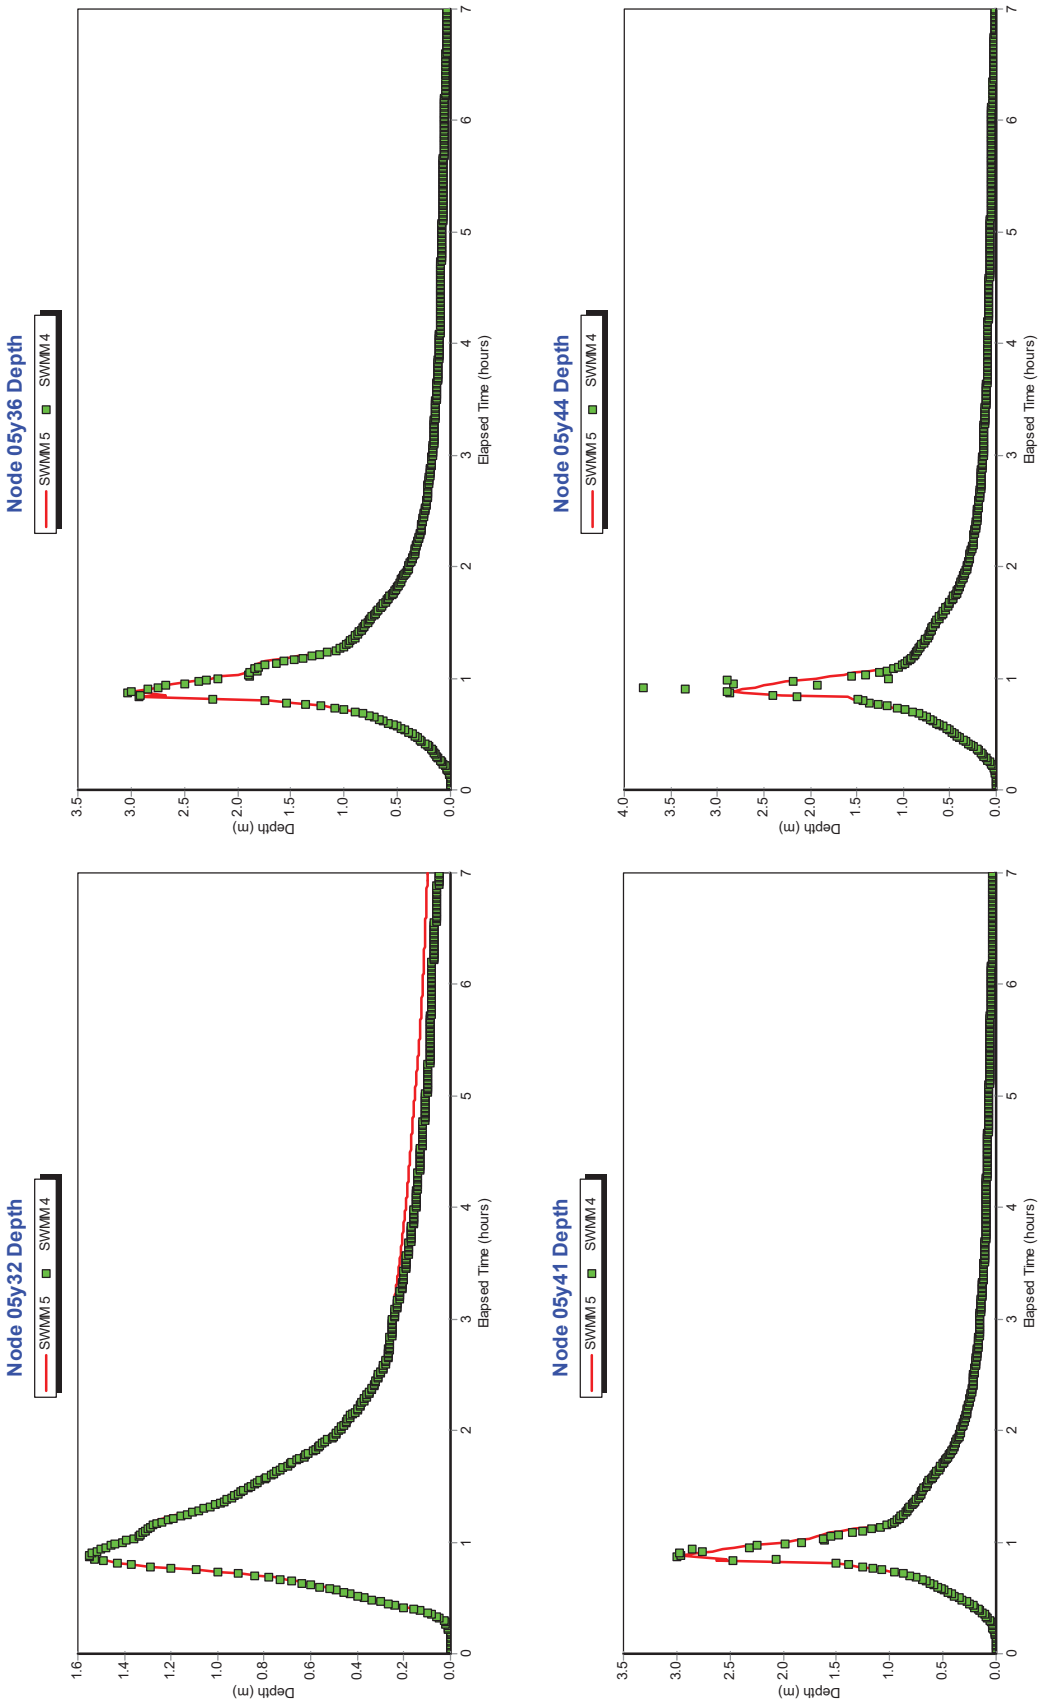

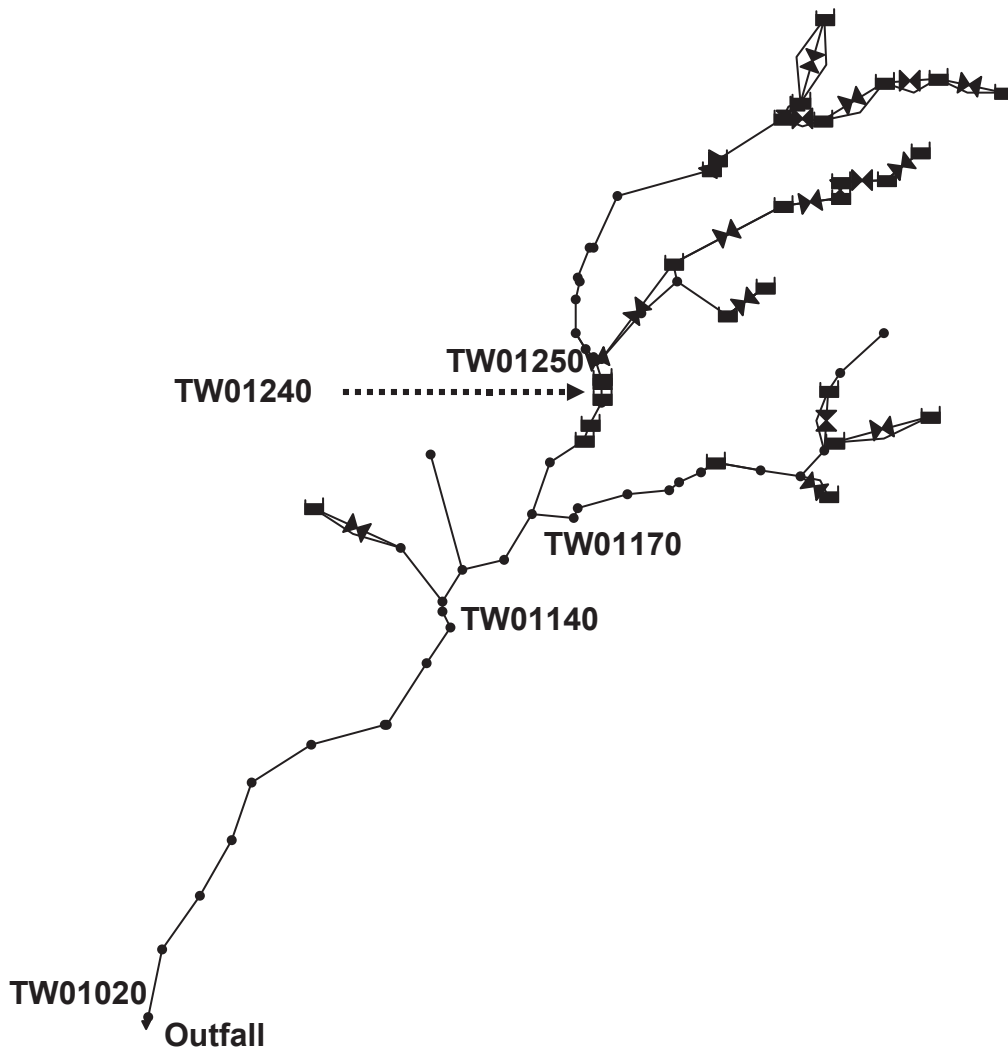

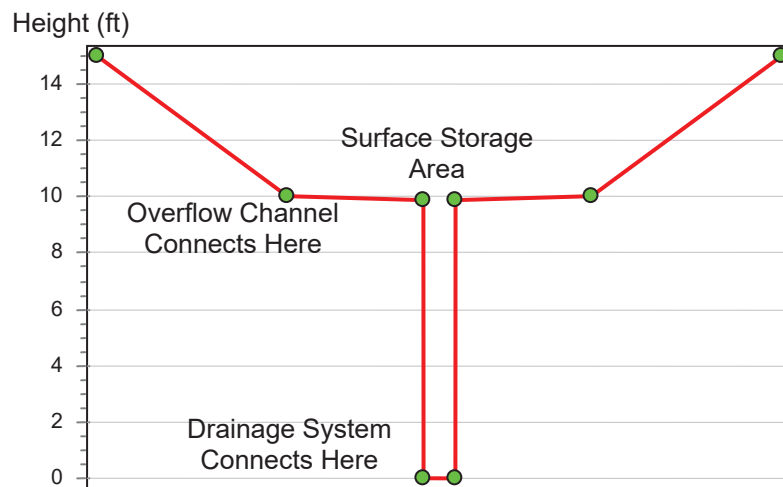

Figure 6.6. Comparison of Water Depths at Select Locations for Example USER1.

Example USER2

This example models a 3.5 square mile drainage area broken into 17 subcatchments. The conveyance system, shown in Figure 6.6, contains 83 conduits that are a mixture of irregular natural channels, open channels and closed pipes of various shapes. There are 28 storage units along with 19 weirs. Many of these storage units and weirs represent junctions with above-ground surface storage coupled with road overflows. A typical arrangement is shown in Figure 6.7. A 4.4 inch, 24-hour design storm, depicted in Figure 6.8, was applied to the system over a 36-hour simulation period using a 5 second flow routing time step and a 5 minute reporting time step.

**Figure 6.6. Schematic of the Drainage Network for Example USER2.**

**Figure 6.7. Configuration of Surface Storage Units with Road Overflows Used Throughout Example USER2.**

**Figure 6.8. Rainfall Hyetograph for the Design Storm Used for Example USER2.**

Table 6.2 compares the runoff computations between the two programs. The results are almost identical. Figure 6.9 compares the peak flows computed by the two programs in the system's conduits. The agreement is very good with the average difference being less than 2 percent. Figure 6.10 compares flows produced by the two programs at the four locations pictured in Figure 6.6. Figure 6.11 does the same for node water depths at these same locations. Finally, Figure 6.12 depicts the behavior of the two programs at one of the surface storage – road overflow locations, TW01240.

**Table 6.2. System-Wide Runoff Results for Example USER2**

	<i>SWMM 5</i>	<i>SWMM 4</i>
Precipitation (in)	4.391	4.391
Evaporation (in)	0.014	0.014
Infiltration (in)	1.161	1.162
Runoff (in)	3.125	3.123
Final Storage (in)	0.091	0.091

C. Flow in Main Drainage Pipe

B. Cross-Section Geometry of Overflow Channel

D. Flow in Overflow Channel

Figure 6.12. Comparison of Surface Storage – Road Overflow Arrangement at Location TW01240

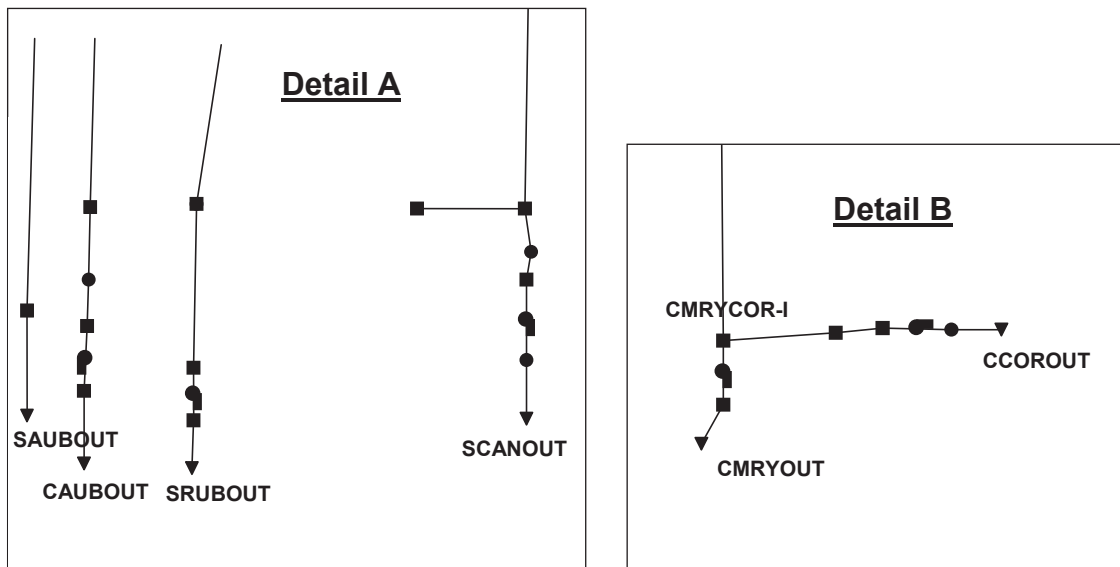

Example USER3

The USER3 data set is a combined sewer system containing 168 subcatchments that encompasses an area of 6 square kilometers. The network schematic is shown in Figure 6.13. The system contains 134 pipes which have mostly circular or egg-shaped cross sections. Of the 141 nodes in the network, 6 are outfalls (see Figure 6.14 for a detail drawing) and 130 are manhole or catch basin structures that are represented as small storage units (see Figure 6.15 for a representative profile). There are 5 pumps in the model that discharge directly to the system's outfalls. The 3-hour, 42 mm design storm used in the simulation is shown in Figure 6.16. This system was analyzed using a 0.5 second routing step, a 1 minute reporting time step and a 6 hour total duration.

**Figure 6.13. Schematic of the Drainage Network for Example USER3.**

**Figure 6.14. Detailed Schematics of the Outfalls for Example USER3.**

**Figure 6.15. Profile View of a Typical Manhole Structure in Example USER3.**

**Figure 6.16. Rainfall Hyetograph for the Design Storm Used for Example USER3.**

Table 6.2 shows the overall results of the runoff calculations. Both programs produce essentially the same amounts of runoff. Table 6.3 compares the flow balances for the routing calculations and shows a reasonable match between the two programs. The peak flows in each conduit are compared in Figure 6.17. SWMM 4 is clearly producing higher peak flows in many of the conduits than is SWMM 5 in this example. Flow comparisons for the system's outfalls are shown in Figures 6.18 and 6.19. The general shapes of these hydrographs are similar, but SWMM 4 tends to produce a higher peak flow. Figure 6.20 compares flows in several of the pipes shown along the main trunk line between locations CMCPLG and CAUBPOR. The SWMM 4 results shown in this figure suggest that numerical instabilities might be causing the higher peak flows as compared with SWMM 5.

One possible cause of SWMM 4's stability problem might be the shape of the manhole storage units used throughout the model. Figure 6.21 compares the SWMM 4 and 5 flow results for conduit SXANELG using the original set of storage nodes along its trunk line while Figure 6.22 does the same for a simulation where these nodes were converted into simple junctions. Note the reduced amount of instability in the SWMM 4 solution and the closer match it gives to the SWMM 5 hydrograph. Finally, Figure 6.23 gives evidence of how SWMM 5 is able to maintain the stability of its solution even when the flow routing time step is raised from 0.5 to 5 seconds.

**Table 6.2. System-Wide Water Balances for Runoff in Example USER3 (all quantities are in millimeters).**

<i>System Total</i>	<i>SWMM 5</i>	<i>SWMM 4</i>

### Example USER4

Example USER4 is a combined sewer system covering 528 acres divided into 112 subcatchments. Its schematic is shown in Figure 6.24. There are 209 circular conduits connecting 209 junctions and one outfall. Each subcatchment contributes both a dry weather sanitary flow (modeled as an external time series inflow applied to the subcatchment's outlet node) as well as a wet weather flow produced for the storm shown in Figure 6.25. The basin is fairly steep as shown by the profiles plotted in Figure 6.26. The system was analyzed over a 24 hour simulation period using a 5 second flow routing time step and a 5 minute reporting time step.

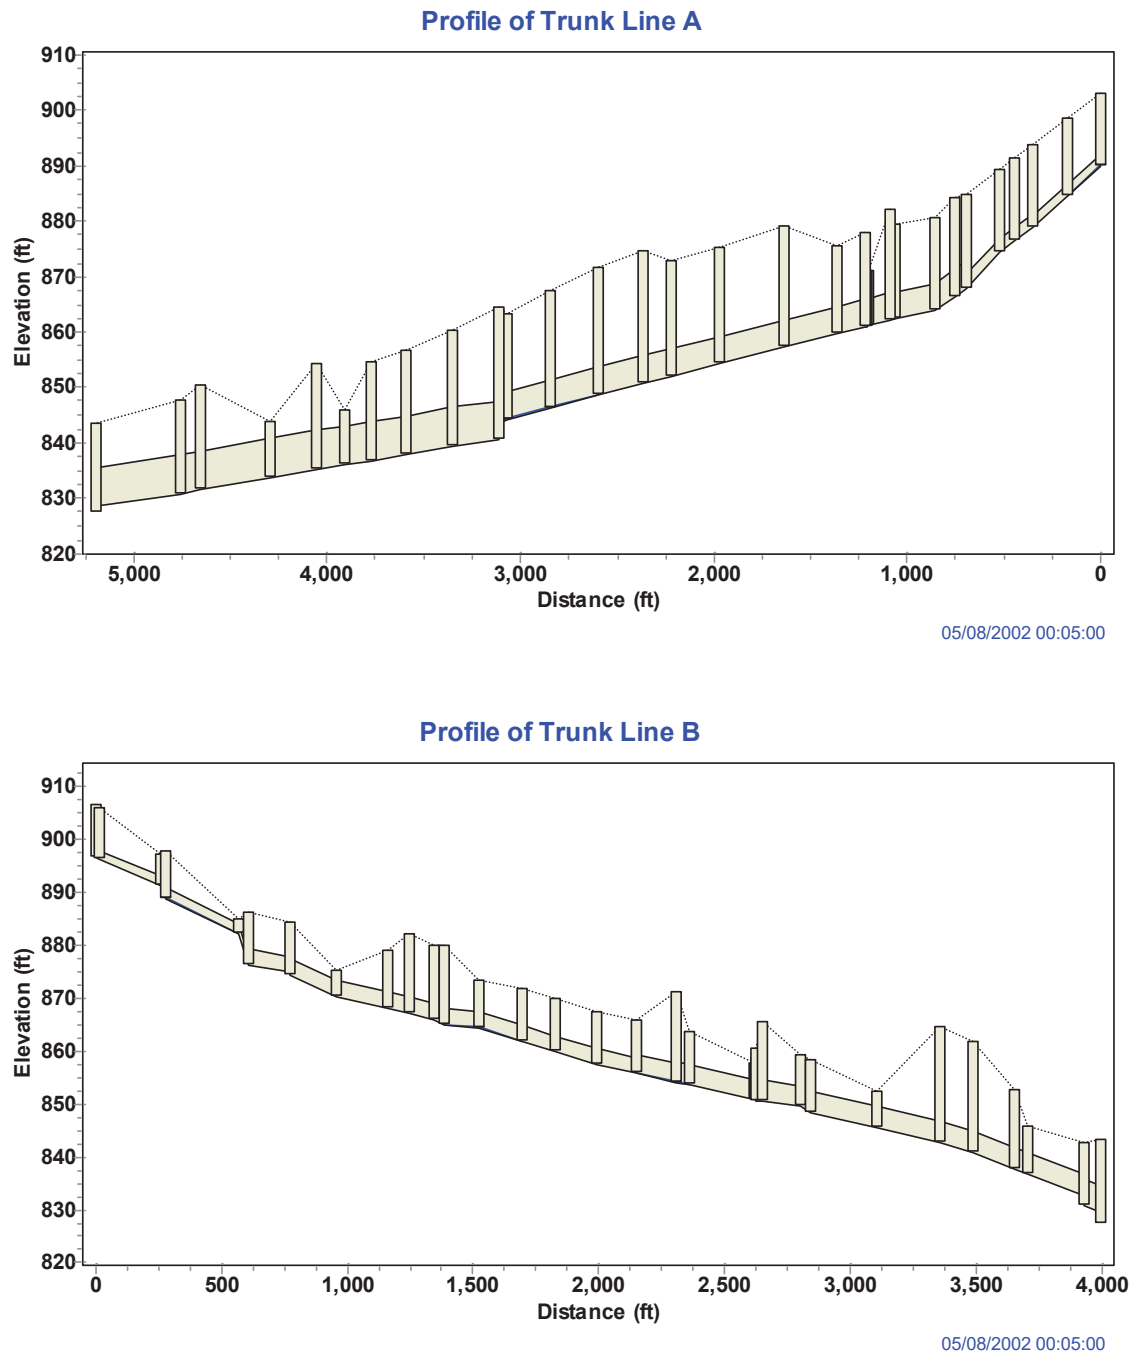

**Figure 6.24. Schematic of the Drainage System for Example USER4.**

**Figure 6.25. Rainfall Hyetograph for Example USER4.**

The runoff calculations for both SWMM 4 and 5 are summarized in Table 6.4. Both programs produce essentially the same amount of runoff. The peak flows in each conduit are compared in Figure 6.27. Again, there is excellent agreement between the two programs. Flow hydrographs for conduits P1, P2, P3 and P4 are compared in Figure 6.28 while water depths at the upstream end of these conduits are compared in Figure 6.29. Note how these results reflect the steep-sloped nature of the drainage system, wherein the runoff hydrographs entering the system are essentially translated downstream with little delay or change in shape.

**Figure 6.26. Elevation Profiles of Trunk Lines A and B for Example USER4.**

**Table 6.4. System-Wide Water Balances for Runoff in Example USER4 (all quantities are in inches).**

<i>System Total</i>	<i>SWMM 5</i>	<i>SWMM 4</i>
Precipitation	1.29	1.28
Evaporation	0.04	0.06
Infiltration	0.78	0.77
Surface Runoff	0.46	0.45
Final Surface Storage	0.02	0.00

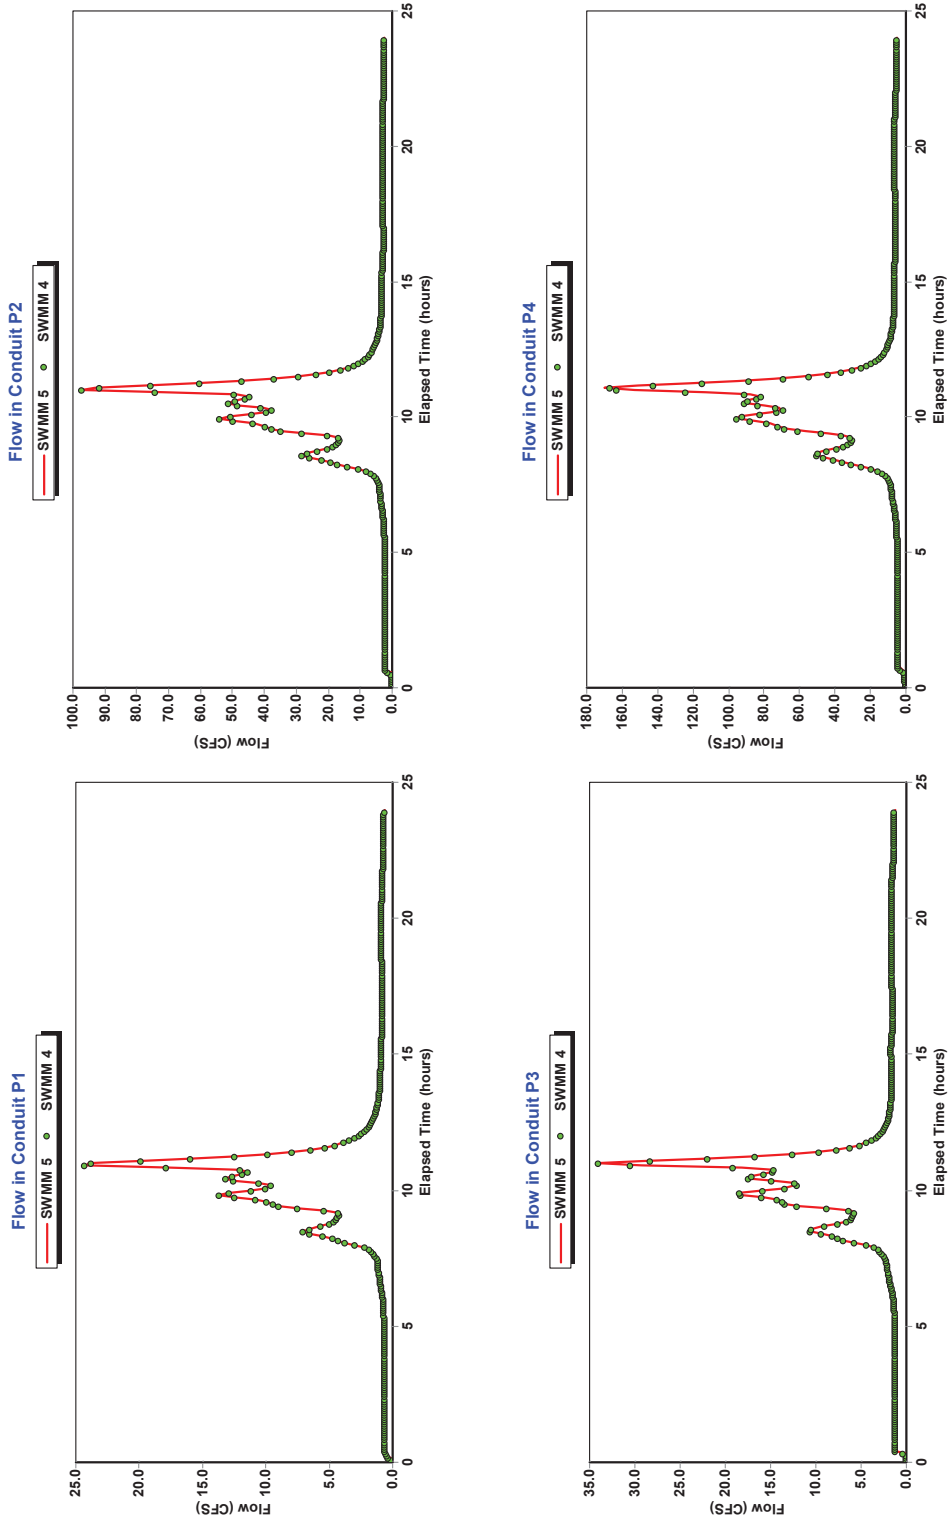

Figure 6.28. Comparison of Flows in Selected Conduits for Example USER4.

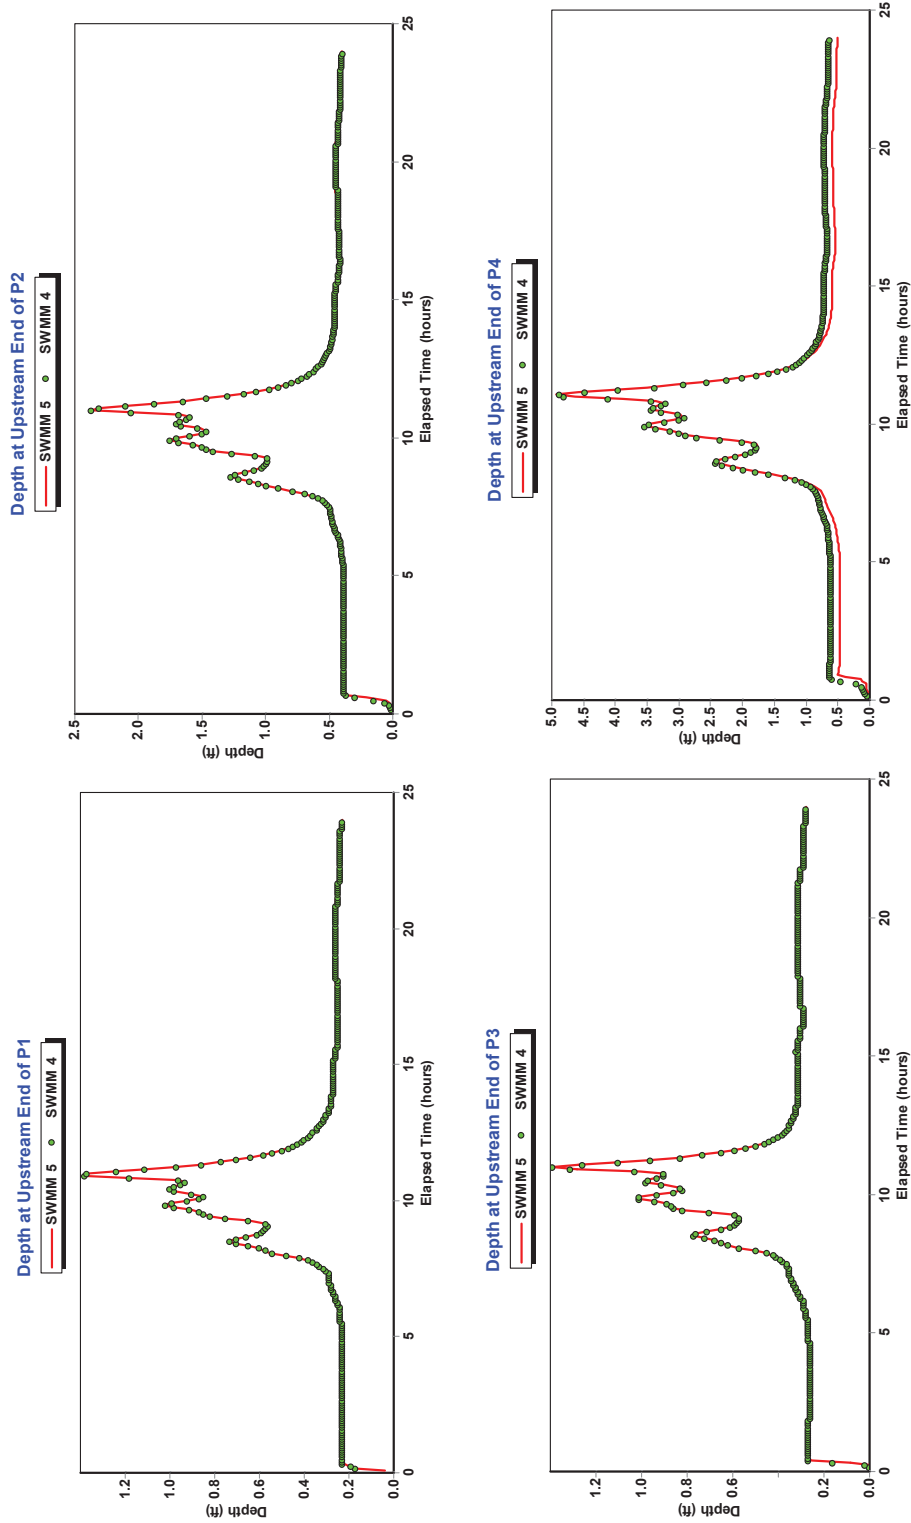

Figure 6.29. Comparison of Water Depths at the Upstream Nodes of Selected Conduits for Example USER4.

### Example User5

The final user-supplied example, USER5, models a 1,177 acre watershed using 145 subcatchments draining to 273 conduits, the majority of which are irregular natural channels. The drainage system schematic is shown in Figure 6.30. The design storm event is displayed in Figure 6.31. In addition, the system receives inflows at 3 locations from upper portions of the watershed that were modeled separately. The inflow hydrographs for these locations are shown in Figure 6.32. The system was analyzed over a 4 hour period using a 1 minute reporting time step and a 0.5 second flow routing time step. Larger routing time steps caused SWMM 4 (but not 5) to become highly unstable.

**Figure 6.30. Drainage System Schematic for Example USER5.**

Figure 6.31. Design Storm Hyetograph Used in Example USER5.

Figure 6.32. External Lateral Inflows for Example USER5.

Table 6.5 lists the water balances obtained by both SWMM 5 and 4 for the overall runoff computations for this example. The runoff results are very similar with SWMM 5 having a smaller mass balance error than SWMM 4. A comparison of the peak flows computed in the conduits by each program is shown in Figure 6.33. Absent from this figure are the conduits contained in the portion of the drainage system marked as Detail A. These will be discussed separately. For the remaining conduits there appears to be good agreement for peak flows with a few exceptions. An example of one of these exceptions is conduit *746\_modify* which is located within the area marked Detail B on the system schematic. The time series of flows in this conduit computed by each program is shown in Figure 6.34. The difference in peak flows can be attributed to the larger instability produced by SWMM 4 around the peak flow period. Similar behavior was observed at the other conduits where peak flow differences were large.

The majority of conduits had similar flow profiles under both SWMM 4 and 5. Some examples are shown in Figures 6.35 and 6.36 for the conduits labeled on the system schematic. Water depth profiles at the upstream nodes of these same conduits are compared in Figures 6.37 and 6.38.

One area of this system which showed considerable differences between SWMM 4 and 5 is the one marked Detail A in Figure 6.30. The schematic of this portion of the system is shown in Figure 6.39. It consists of a 130-foot wide, flat channel that is fed by both a diversion box culvert and the outlet from a 3.2 acre detention basin. The downstream end of the channel flows into an outflow structure that consists of three weir openings at different heights. The channel is divided into 10 individual segments whose elevation profile is shown in Figure 6.40. Figure 6.41 through 6.43 displays the time histories of the flow entering the channel as well as the flows in the first and third sections of the channel. Both SWMM 4 and 5 produce an oscillatory flow motion in these sections due to the outflow control exercised at its downstream end. The magnitude of this oscillation seems suspiciously high in SWMM 4 when compared against the inflow to the channel. Interestingly, the oscillation appears to be caused by the inertial terms of the momentum equation (those involving changes in flow area with respect to space and time). Figure 6.44 shows what happens in the third channel section when these terms are dropped from SWMM 5 using its “Ignore Inertial Terms” option.

**Table 6.5      System-Wide Water Balances for Runoff in Example USER5 (all quantities are in inches).**

<i>System Total</i>	<i>SWMM 5</i>	<i>SWMM 4</i>
Precipitation	2.93	2.93
Evaporation	0.02	0.02
Infiltration	1.00	1.00
Surface Runoff	1.77	1.72
Final Surface Storage	0.15	0.15
Continuity Error (percent)	0.10	1.45

**Figure 6.43. Flow in the Third Section of the Channel of Detail A for Example USER5.**

**Figure 6.44. Flow in the Third Section of the Channel of Detail A for Example USER5 with Inertial Terms Ignored in SWMM 5.**

As a final note on this example, both SWMM 4 and 5 were run with the routing time step increased from 0.5 to 5 seconds. SWMM 5 produced essentially the same results, with an overall continuity error of 1.29 percent. The continuity error produced by SWMM 4 was 619 percent with most flow time histories being clearly in error. As an example, Figure 6.45 compares the flow at the outfall produced by the two programs and also plots the total inflow into the system. The SWMM 5 outflow matches that of the run using the smaller time step (see the last plot in Figure 6.36, although a visual comparison is difficult due to the vast difference in the vertical axis scales in the two plots). As reflected in its extremely high continuity error, the SWMM 4 outflow is an order of magnitude too high for this system at the larger time step.

**Figure 6.45. Flow Computed at the Outfall of Example USER5 Using a 5 Second Routing Time Step.**

## 7. Summary and Conclusions

The dynamic wave flow routing computations in SWMM 5 (version 5.0.006) and SWMM 4 (version 4.4h) were compared against one another on a total of 20 test examples. These examples included:

- 10 examples from the original SWMM Extran Users Manual that modeled various types of drainage system elements, such as orifices, weirs, pumps, irregular-shaped channels, and storage units
- 5 examples that tested the ability to model flat slopes, pipe constrictions, steep drops, adverse slopes, and inlet offsets.
- 5 real-world systems ranging in size from 59 to 273 conduits that modeled a variety of storm sewer, combined sewer, and natural channel drainage systems.

For the most part the time histories of flows and water depths produced by SWMM 5 closely matched those of SWMM 4. There were some exceptions however. In two cases these were due to differences in the assumptions used to model specific elements between the two programs - bottom orifices and Type 1 pump wet wells. In some of the User Supplied test cases differences arose due to numerical instabilities in the SWMM 4 solution, even with as low a time step as 0.5 seconds. These instabilities were most apparent in the examples that included odd-shaped storage units and oscillatory flows due to significant inertial effects. In contrast SWMM 5 had no problem in handling these features.

SWMM 5 was generally able to produce stable solutions using a much higher routing time step than was SWMM 4. This was the case for 50 percent of the Challenge and User-Supplied test examples. SWMM 5 also executed slightly faster than SWMM 4 as shown by the run times for the User-Supplied examples compared in Table 7.1.

**Table 7.1. Execution Times for the User-Supplied Test Examples (in seconds).**

<b>Example</b>	<b>SWMM 4</b>	<b>SWMM 5</b>
USER1	4	2
USER2	17	10
USER3	52	34
USER4	30	22
USER5	56	75

Overall, the Quality Assurance testing conducted in this study indicates that the updated SWMM 5.0 program performs dynamic wave flow routing as good as or better than SWMM 4.4.

## Appendix A. SWMM 4 Routing Models

As mentioned at the beginning of Section 2 of this report, SWMM 4.4 offers the user three different options for solving its dynamic wave flow routing model. The Explicit Method was discussed in some detail in Section 2. The Enhanced Explicit Method is identical to the Explicit Method except that it uses an alternate way to express the inertial terms of the momentum equation in finite difference form. The resulting flow updating equation that is used in place of Eq. (4) is:

$$Q_{t+\Delta t} = \frac{Q_t + \Delta Q_{gravity}}{1 + \Delta Q_{friction} + \Delta Q_{losses} - \Delta Q'_{inertial}} \quad (A.1)$$

where

$$\Delta Q'_{inertial} = 2(\bar{A} - A_t)/\bar{A} + (Q_t/A_t)(A_2 - A_1)/\bar{A}(\Delta t/L) \quad (A.2)$$

and the other terms have the same definitions as before.

The third solution method, called the Iterative Method, also uses the above form of the flow updating formula. However, it replaces the Modified Euler integration method with a successive approximation method that is similar in nature to SWMM 5's method. It also replaces the surcharge algorithm with a "Preissmann Slot" approach. This is a narrow wedge of additional flow area added to the top of a closed conduit once it pressurizes. In addition, it employs a variable routing time step that is adjusted during the simulation to try to satisfy the Courant stability criterion as the simulation unfolds. One must consult the SWMM 4.4 Fortran code itself to unravel all of the details of the Iterative Method as the description of it in the SWMM Extran Manual (Roesner, et al., 1992) is somewhat out of date.

For the Quality Assurance testing of SWMM 5 against SWMM 4 it was decided that the Explicit Method would be used in all of the SWMM 4 runs. This decision was based on a preliminary comparison of the three SWMM 4 solution methods on a subset of the same test data sets that would be used in the full testing. This comparison revealed the following results:

1. The Enhanced Explicit method appeared to offer no consistent advantage over the Explicit method in the test cases studied. In most cases it produced identical results. In at least one case (TEST5 described on page 68), it produced a clearly incorrect solution (see Figure A.1 below) with a continuity error of -397 percent when compared with both the SWMM 4 Explicit method as well as SWMM 5. It also did not produce more stable solutions than the Explicit method when both were run at higher routing time steps.

2. The Iterative method failed to perform acceptably in a consistent fashion. There were a number of examples where its flow solution was either markedly different or clearly inferior to that of the Explicit method. These include:
  - a. Example EXTRAN1 (the simple 2-branch network described on page 15). As seen in Figure A.2, the Iterative method produced a flow hydrograph in surcharged pipe 1602 whose shape is considerably different than both the SWMM 4 Explicit method and the SWMM 5 solution.
  - b. Example TEST4 (the inverted siphon example described on page 64). The Iterative method produced a solution that was much more unstable than that produced by the Explicit method (see Figure A.3).
  - c. Example USER1 (the 59 conduit storm sewer system described on page 72). The flow continuity error produced by the Iterative method was -3150 percent compared with only 0.19 percent for the Explicit method.
  - d. Example USER2 (the 83 conduit drainage system described on page 77). The Iterative method took 8.75 minutes to execute and produced a flow continuity error of -317 percent compared to 0.5 minutes and 0.4 percent, respectively, with the Explicit method.

## Appendix B. Test Data Sets

All twenty test data sets used in this study are available in electronic format at the EPA SWMM web site [www.epa.gov/ednnrmrl/swmm](http://www.epa.gov/ednnrmrl/swmm). Each data set includes:

- The SWMM 4 Extran input file and, for the user-supplied test cases, the corresponding SWMM 4 Runoff input file.
- The equivalent SWMM 5 input file.
- Calibration files that contain the SWMM 4 time series results for node depth and conduit flow that were used to generate the comparison plots in this report.

The SWMM 4 input data files are named with a “.dat” extension (e.g., extran1.dat) while the SWMM 5 input files have a “.inp” extension (e.g., extran1.inp). The calibration files are named “xxxx\_y.dat” for node depth results or “xxxx\_q.dat” for link flow results, where xxxx is the name of the test case.

**Attachment 2 – FLO-2D Verification Report**  
**(Secured file cannot be combined and provided as a  
separate document)**

## **Attachment 3 – Test Cases 1a and 1b Hand Calculations**

Hand Calculation, Test 1a

Given a steady discharge of 8,000 cfs spread across the 4 inflow nodes (2,000 cfs per inflow element), the velocity and depth were computed using Manning's equation within the lower reach of the flume. The flow accelerated to a steady flow condition since the inflow elements had no convective acceleration component in the down-slope direction. There was also no local acceleration term in the full dynamic wave momentum equation due to the steady flow condition and for this prismatic channel case, the momentum equation collapses to the kinetic wave equation. The unknown hydraulic variables of velocity and depth were computed by hand using Manning's equation and continuity.

$$Q = VA = \frac{1.486}{n} R^{\frac{2}{3}} S_f^{\frac{1}{2}} A$$

Where: A = flow area = width\*depth = 200ft \* flow depth d  
 V = depth average velocity  
 n = 0.05  
 S<sub>f</sub> = friction slope = S<sub>o</sub> = bed slope using the kinematic wave equation = 0.003  
 R = hydraulic radius ≈ flow depth d for a wide shallow channel  
 Q = discharge 8,000 cfs

Substituting and solving for d:

$$Q = 8,000 \text{ cfs} = (1.486/0.05) * d^{2/3} * (0.003)^{1/2} * 200\text{ft} * d$$

$$d = (8,000/325.57)^{3/5}$$

$$d = 6.8 \text{ ft}$$

Solving for V:

$$V = Q/A = 8,000 \text{ cfs} / (6.83\text{ft} * 200 \text{ ft})$$

$$V = 5.9 \text{ fps}$$

**Solving for n=0.08 for Repeatability**

**Other inputs remain same as listed below and Manning's roughness coefficient is changed to 0.08**

Substituting and solving for d:

$$Q = 8,000 \text{ cfs} = (1.486/0.08) * d^{2/3} * (0.003)^{1/2} * 200 \text{ ft} * d$$

$$d = (8,000/203.48)^{3/5}$$

$$\mathbf{d = 9.05 \text{ ft}}$$

Solving for V:

$$V = Q/A = 8,000 \text{ cfs} / (9.05 \text{ ft} * 200 \text{ ft})$$

$$\mathbf{V = 4.42 \text{ fps}}$$

### Hand Calculation, Test 1b

A similar calculation is done for the multiple channel test with the inflow of 10 cfs, channel width of 5 ft, channel slope of 0.003 ft/ft, and channel Manning's coefficient of 0.05. The approximation in Test 1a of hydraulic radius being approximately the same as the flow depth is no longer applicable since the flow regime in Test 1b is not a wide shallow channel flow. Therefore, flow depth is solved iteratively (either manually or using MS Excel Solver feature).

Solving for d:

$$Q = 10 \text{ cfs} = (1.486/0.05) * d^{2/3} * (0.003)^{1/2} * 5 \text{ ft} * d$$

$$\mathbf{d = 1.34 \text{ ft}}$$

Solving for V:

$$V = Q/A = 10 \text{ cfs} / (1.34 \text{ ft} * 5 \text{ ft})$$

$$\mathbf{V = 1.48 \text{ fps}}$$

## **Attachment 5 – Test Case 2 FLO-2D Input Files**

#### 4.2 Case Study 2. Overland Flow - Truckee River

Tetra Tech, Inc. was contracted by the US Army Corps of Engineers, Sacramento District, to conduct a flood hazard delineation project for the Truckee River through Reno, Nevada. This project was supported by the City of Reno and Washoe County Flood Control District. The FLO-2D model was selected for this study because most of the flood volume in the lower reach of the study area was on the floodplain. The focus of this study was a January 1997 flood that was documented with gage data, high water marks, pictures and video. This data base was supplemented with over 100 post flood channel cross section surveys. An existing HEC-2 model was updated and used to calibrate in-channel flow n-values.

The key to the FLO-2D overbank flood analysis was the relationship between the volume of water in the channel and the volume of water on the Truckee Meadows floodplain area. Downstream of this area, all the flow in the river and on the floodplain was forced over the geologic control (bedrock sill) and into a narrow canyon (Figure 38). This broad floodplain has historically flooded in response to the backwater at the canyon entrance. Just upstream of the canyon a USGS gage (New Vista) was located. Upstream of the Truckee Meadows area was another gage (Reno gage) which essentially captured all the flow entering the Meadows reach. Between the two gages, the river conveyance capacity was limited to about 10,000 cfs. The 1997 flood peak discharge was approximately 20,000 cfs. Complicating the flood replication was the fact that the travel time associated with the overbank flooding through the Truckee Meadows floodplain area was on the order of 6 hours whereas the channel flow was less than 0.5 hours.

To replicate the downstream New Vista gage stage for the 1997 flood, it was necessary to accurately route the flow in the channel, the overland flow over the huge meadow and the return flow to the channel upstream of the gage. Following the successful replication of the 1997 flood, the model was applied to other historical flood events that were less well documented. The ability of the model to accurately replicate the lower gage stage as shown in Figures 9 and 10 verified that three components of the model functioned correctly in concert:

- Channel routing
- Unconfined overland flood routing
- Channel-floodplain exchange (both overbank flow and return flow to the channel)

It is noteworthy that this project marked the end of the use of the channel power regression relationships for the channel cross sections. If the actual surveyed cross section data were used in the model instead of the power regression relationship, the predicted stage at the New Vista gage would be an almost perfect match. Only power regression relationship were used to represent the cross sections when the model was initially developed for this project.

Figure 38. Sparks Truckee Meadows Area General Peak Flow Path (Google Earth, 2011)

#### 4.3 Case Study 3. City of Camarillo, California FIS Study

FEMA issued a Preliminary Flood Insurance Study (FIS) reporting Digital Flood Insurance Rate Maps (DFIRM) for Ventura County and the City of Camarillo on September 16, 2005. In February 2006, the City appealed and FEMA in April 2006 agreed with the technical assessment of the City's appeal and requested additional analysis. In January 2008, the City filed a detailed two dimensional FLO-2D model floodplain study (27,979 - 100 ft elements) in support of their appeal. The revised floodplain boundaries and elevations were incorporated into the DFIRM with a date of January 20, 2010. After the DFIRMs went into effect, it became apparent that it was difficult to determine whether flood insurance was required in certain areas. The City came to the conclusion that a more refined hydraulic model should be prepared to better depict the 100-year flood for flood insurance and requested that 10 ft grid elements be used in the FLO-2D model. It was presumed that a higher resolution grid system was required to more accurately define the shallow flow flooding in the densely populated urban areas.

The new FLO-2D FIS Study 10 ft model encompassed 1,093,307 grid elements, over 5,000 buildings, almost 2,400 channel elements, spatially variable n-value assignment (including the streets), privacy walls, and numerous hydraulic structures to simulate the culverts and bridges (Figures 39 - 41).

## **Attachment 6 – Test Case 2 Flow Comparison**

Untitled

```
# Data for the following station is contained in this file
# -----
#  USGS 10350000 TRUCKEE RV AT VISTA, NV
#
# This data file was retrieved from the USGS
# instantaneous data archive at
# http://ida.water.usgs.gov
#
# -----WARNING-----
# The instantaneous data you have obtained from
# this automated U.S. Geological Survey database
# may or may not have been the basis for the published
# daily mean discharges for this station. Although
# automated filtering has been used to compare these
# data to the published daily mean values and to remove
# obviously bad data, there may still be significant
# error in individual values. Users are strongly
# encouraged to review all data carefully prior to use.
# These data are released on the condition that neither
# the USGS nor the United States Government may be held
# liable for any damages resulting from its use.
#
# This file consists of tab-separated columns of the
# following fields.
#
# column          column definition
# -----
# site_no         USGS site identification number
# date_time       date and time in format (YYYYMMDDhhmmss)
# tz_cd           time zone
# dd              internal USGS sensor designation ('data descriptor')
# accuracy_cd     accuracy code
#                  0 - A daily mean discharge calculated from the instantaneous
#                  data on this day is 0.01 cubic feet per second
#                  or less and the published daily mean is zero.
#                  1 - A daily mean discharge calculated from the instantaneous
#                  data on this day matches the published daily mean
```

## Untitled

# within 1 percent.

# 2 - A daily mean discharge calculated from the instantaneous

# data on this day matches the published daily mean

# from greater than 1 to 5 percent.

# 3 - A daily mean discharge calculated from the instantaneous

# values on this day matches the published daily mean

# from greater than 5 to 10 percent.

# 9 - The instantaneous value is considered correct by the

# collecting USGS Water Science Center. A published daily

# mean value does not exist and/or no comparison was made.

# value discharge in cubic feet per second

# precision digits of precision in the discharge

# remark optional remark code

# Remark Explanation

# < Actual value is known to be less than reported value.

# > Actual value is known to be greater than reported value.

# & value is affected by unspecified reasons.

# A value is affected by ice at the measurement site.

# B value is affected by backwater at the measurement site.

# e value has been estimated by USGS personnel.

# E value was computed from an estimated value.

# F value was modified due to automated filtering.

# K value is affected by instrument calibration drift.

# R Rating is undefined for this value.

#
