

January 10, 2017

Mr. Ted Maine, Nuclear Site VP  
Omaha Public Power District  
Fort Calhoun Station, FC-1-5 Plant  
9610 Power Lane  
Blair, NE 68008

Re: Contract No. 00227943; HSA and Limited Site Characterization

**SUBJECT:** Limited Radiological and Non-Radiological Site Characterization Survey Reports  
Fort Calhoun Nuclear Station, Blair, Nebraska

Correspondence No. 9

Dear Mr. Maine;

TSSD Service, Inc. is pleased to provide you the two final Site Characterization Reports: The Limited Radiological and Non-Radiological Site Characterization Survey Reports for the Fort Calhoun Station, completed in support of your decommissioning program.

The intent of these Limited Characterization Surveys was to focus on the most likely areas where releases could impact environmental media and where remediation could impact future costs and/or schedules. These reports present the field activities, field screening and analytical data, and identify both areas that are impacted as well as areas where no further actions are warranted.

If you have any questions, please do not hesitate to call me at 860-377-4169. We appreciate this opportunity to work with your team and look forward to our continued partnership on future projects.

Respectfully,  
TSSD Service, Inc.

A handwritten signature in black ink, appearing to read "Charles Mercier", is written over a horizontal line.

Charles Mercier

**SECTION 1 INTRODUCTION**

Haley & Aldrich, Inc. (Haley & Aldrich) has prepared this Limited Site Non-Radiological Characterization Survey Report (Report) to support the characterization of non-radiological or chemical constituents in environmental media at the Omaha Public Power District's (OPPD) Fort Calhoun Station (FCS).

Specifically, this Report focuses on characterizing the eight Areas of Interest (AOIs) identified in the Limited Historical Site Assessment (HSA), where releases are most likely to have impacted soils, sediments, or groundwater. These AOIs were selected during the preparation of the Limited Site Characterization Work Plan (Work Plan) [1] because they are areas where remediation (if required) may impact the decommissioning cost estimate (DCE), either due to the extent of impacted media or potential impacts to the decommissioning schedule. It should be noted that the remaining AOIs not discussed in this Report will most likely require additional investigations, but the impacts are likely to be restricted to shallow soils, or involve compounds that would not have a long-term impact to soils and groundwater.

**1.1 PURPOSE**

The purpose of this Report is to summarize the findings of the limited site non-radiological characterization investigation. The investigation was designed to identify significant environmental impacts to soils, sediments, and groundwater to the extent that subsequent characterization and remediation could impact the DCE and/or decommissioning schedule. The investigation efforts followed the Nebraska Department of Environmental Quality (NDEQ) Voluntary Clean-up Program (VCP) guidance as well as the regulations under the Environmental Protection Agency (EPA) Resource Conservation and Recovery Act (RCRA) under 40 CFR 261 and Toxic Substance Control Act (TSCA) under 40 CFR 761, as applicable.

## **SECTION 2 SITE DESCRIPTION AND BACKGROUND**

### **2.1 SITE DESCRIPTION**

FCS Unit 1 was a Combustion Engineering 2-loop pressurized water reactor (PWR) rated at 479 megawatts (MW) electrical. Plant construction began in 1966. The first fuel assembly was loaded into the reactor between May – June 1973. The Nuclear Regulatory Commission (NRC) issued an operating license on August 9, 1973. The plant officially went online on September 1, 1973 with commercial operation starting 25 days later. The plant went offline on October 24, 2016.

The site operated under the following:

NRC License No. DPR-40

Docket No. 50-285

EPA ID No. 110007129623

#### **2.1.1 Location**

The FCS site is located on the west bank of the Missouri River at river mile 646.0 on 660.46 acres, approximately 19.4 miles north of Omaha, Nebraska. OPPD has a perpetual easement on 582.18 acres of land on the east bank of the river directly opposite the plant buildings. About 85 percent of the site area is on relatively level ground located in the alluvial plain of the river. On the Western part of the site the ground rises sharply about 60 feet to a higher level area which is bounded on the west by United States (U.S.). Highway 75, formerly U.S. Highway 73.

The area adjoining the site is farmland and sparsely populated. The minimum exclusion distance is 2,986 feet (910 meters). The nearest privately owned land is farmland and is approximately 0.5 miles from the site. The nearest population center area of more than 25,000 is formed by adjacent cities of Omaha, Nebraska and Council Bluffs, Iowa. Figure 1 shows the location of the site along the Missouri River.

## **2.2 ENVIRONMENTAL SETTING**

### **2.2.1 Topography**

The FCS Plant is situated within parts of Section 20 and 21, Township 18 North, Range 12 East of Washington County, Nebraska in the Modale quadrangle. The site is part of the Missouri River bottomland, which is a nearly level plain about 15 miles wide at Blair, 8 miles wide at the site and narrowing to 3 miles wide in the vicinity of Omaha-Council Bluffs. The elevation of this plain averages about 1,000 feet above mean sea level at the Site.

The surface of the land, starting from the Missouri River at about elevation 997 feet above mean sea level, falls to an old channel of the river before rising again to approximately 1,004 feet. Beyond this point, the land then gradually falls off to about 1,000 feet, rises again to approximately 1,020 feet, and then rises approximately 60 feet to a higher plateau at elevation 1,080 feet [2].

The Missouri River, which flows generally north to south, forms the northeast to southeast site boundary. This part of the river is referred to by the Corps of Engineers as the Blair Bend. The river limits are under control of the Corps who have established a structure azimuth line which acts as another site boundary. The topography of the site is shown in Figure 2.

The site drainage development program provides proper drainage of the plant site and upstream properties. This system controls runoff of local precipitation; drainage empties into the Missouri River north of the plant.

### **2.2.2 Geology**

The soils below FCS included thick beds of limestone, dolomite, shale, and sandstone with some thin layers of coal beds. The deeper formations were deposited in marine depositional environmental with the shallow soils from the lateral migration of the paleo river channel. The major tectonic features of the mid-continent region began to develop late in the Paleozoic Era, and probably most of the important structural features of the Nebraska Iowa Missouri River Valley area. However, there is no record of movement of the fault in historic times, or any indication of activity in recent geologic time.

At the beginning of the Pleistocene period, the Missouri River Valley and its main tributaries were established in their approximate present positions. Subsequently under successive glacial movements, the valleys were filled and re-opened several times. During this period, the Peorian loess was deposited on the terraces and adjacent uplands. It is probable that only the upper part of the alluvium in the Missouri River Valley is actually of recent age and that deeper deposits are mostly of Pleistocene age.

Unconsolidated sediments at the plant site generally range from 65 to 75 feet in thickness. The soils are typically interstratified and cross-bedded [3]. These soils may be grouped generally into two units:

- an upper fine-grained sandy clay with silt approximately 20 to 50 feet thick; and
- an underlying fine to coarse sand with some gravel. This lower unit extends to the relatively flat-lying carbonate bedrock surface at a depth of approximately 65 to 75 feet below ground surface (bgs).

The upper units were representing former river deposits and are not likely continuous, but rather have preferential channels formed by paleo-oxbow deposits.

Pennsylvanian-aged limestone and shale (bedrock) of the Kansas City Formation are encountered below the overburden soils. The bedrock below the site consists of various types of limestone formations [4].

### **2.2.3 Hydrology**

Groundwater at the site is in hydraulic communication with the adjacent Missouri River, with the water table ranging from 2 to 20 feet below the surface depending on the river stage [5]. However, under typical conditions, the depth to groundwater is approximately 15 to 20 feet bgs [4]. Both soil units identified in Section 2.2.2 are water bearing with the deeper unit exhibiting a higher hydraulic conductivity. The hydraulic gradients below the site are relatively flat with relatively slow ground water velocity [4].

Water levels taken at the site show that the groundwater gradients at the site are nearly flat, with only a gentle slope toward the river, about ten feet below the ground surface. Water levels at the site varied from elevations 993.7 to 992.4 feet, while the river levels recorded during this same period ranged from elevations 993.2 to 992.4 feet. Groundwater levels vary with changes in the river level. The rate of groundwater flow in the alluvial soils varies with the permeability, however, the groundwater flow rate, or velocity is very slow due to the low gradients. The coefficient of permeability varied from about one-half to three feet per day in the upper sandy silt and silty sand. In the lower fine-to-coarse sands and gravels, coefficients of permeability as high as 20 feet per day were measured [4].

According to site documents, groundwater flow directions have been reported to be both toward the Missouri River (northeasterly) and away from the Missouri River (south-southwesterly) [6]. Flow directions toward the river appear to represent times when Missouri River levels are relatively low, e.g. during the spring, summer, and early fall, when most precipitation occurs and the river flow is relatively high [4]. Flow directions away from the river appear to represent times when Missouri river levels are relatively high causing bank storage effects, e.g. during late fall and winter when the river recedes [4, 5].

Locally, below the plant structures, the reverse osmosis water (RO) treatment plant withdraws groundwater, to be used at the plant. This groundwater withdrawal causes a cone of depression and alters groundwater flow. The extraction well is located at the northwest corner of the old warehouse. Testing during the well installation documented that the aquifer may produce approximately 500 gallons per minute (gpm). The production well was in service as of August 2007, continuously pumping about 200 gpm. Measurement of groundwater flow indicated that within 600 feet of the RO well, groundwater flow is toward the RO well (i.e. southwest) [4].

#### **2.2.4 Surface Waters**

The plant site is bounded on the northeast and southeast by a portion of the Blair Bend of the Missouri River. The Corps of Engineers maintains river structures to prevent further meandering of the channel within the alluvial flood plain; the structures take the form of pile dikes and bank revetments. Fish creek is an intermittent drainage stream that runs along the [plant] north boundary of the Protected Area (PA). This stream discharges into a larger wetland, before flowing in the Missouri River as shown on Figure 3.

There are six dams upstream of the plant site that control the river flow. The nearest structure to the site is Gavin's Point and the most distant structure is Fort Peck. There are no dams, locks, or similar structures on the Missouri downstream of the plant site [6]. The Site has been flooded several times with the most recent occurring in 2011, where the river overflowed its banks for several months. The flood stage from that event and its impacts to the site are shown on Figure 4.

#### **2.2.5 Meteorology**

Nebraska is located midway between two distinctive climatic zones, the humid east and the dry west [7]. Cyclic weather conditions representative of either zone, or combinations of both occur. Changes in weather result from the invasion of large masses of air with dissimilar properties. These air masses tend to get their characteristics from either the warm and humid south-southeast, the warm and dry southwest, the cool and dry north-northwest, or the cold continental polar air of the north. The region is also affected by many storms or cyclones (areas of low pressure) which travel across the country, generally from west to east. Periodic and rapid changes in the weather are normal, especially in the winter.

Annual average precipitation for the region is about 28.5 inches, but annual amounts vary widely from year to year. About 75 percent of the precipitation occurs during showers and thunderstorms from April through September. Snowfall amounts to about 30 inches of snow as the annual average, but total annual amounts vary widely from year to year [7].

The surface wind direction and speed is quite varied during all seasons of the year. The prevailing wind direction from May through December is from south-southeast; north-northwesterly winds prevail during the remainder of the year. The mean annual wind speed is 10.6 miles per hour (mph).

The mean annual temperature for the region is 51.1°F. The January monthly mean is 20.2°F, while that for July is 77.7°F. Relative humidity ranges from an average of about 78 percent for the period midnight to noon and about 59 percent from the period noon to midnight. The mean percentage of possible sunshine over the area is about 50 percent in winter and about 75 percent in summer [7].

### SECTION 3 SCOPE OF WORK

During the HSA, a total of 17 AOIs were identified for non-radiological (chemical) use based on historical use and operations (see Table 1). These included chemical and equipment storage areas, historic practices, and areas where non-radiological materials could have been released to soils, groundwater, sediments, or surface water. All work will be completed in compliance with NDEQ regulations, and if warranted, remedial actions will be executed under their VCP program. Of the 17 AOIs identified, seven were identified where environmental media impacts could require significant remediation. Data from each of these seven areas was collected and evaluated with respect to the NDEQ VCP cleanup criteria presented in Appendix A [8], in addition to the EPA Maximum Contaminant Levels (MCLs), where applicable. All AOIs are listed below. The seven AOIs that were the focus of this limited characterization effort are highlighted below in bold and italics. All AOIs are shown on Figure 5 and the italicized AOIs are presented on Figures 6 through 12.

**Table 1. Areas of Interest (AOIs)**

16	Storm Water Outfalls
17	Site Wide Groundwater

#### 3.1 SAMPLE METHODOLOGY

The sampling program was completed in accordance with Table 2 and the Work Plan [1]. Locations for each of the explorations are shown on Figures 6 through 12.

Samples were collected using the following methods:

- Surface soil samples. Shallow soil was collected using a hand auger or direct push drilling methods to sample soils at depths up to 5 feet bgs. If there was access the direct push was used in these areas.
- Subsurface samples. Direct Push drilling methods were implemented to collect soil and groundwater grab samples. This method used hydraulics to press a cylinder through the soil to retrieve a core. The core was then logged in the field for soil properties and documented for any evidence of contamination. In areas where volatile or semi-volatile organic compounds (VOCs or SVOCs) were a contaminant of concern (COC), soils were also screened using a photoionization detector (PID).
- Sediment Samples. Sediments were collected from the top 0 to 6 inches of sediment and the data was used to evaluate potential impacts to the benthic receptors.
- Groundwater Grab Samples. Groundwater samples were collected through the direct push locations to identify if there are impacts to groundwater. These samples are considered screening level samples as they will not be collected from groundwater monitoring wells, nor collected using the low flow/low stress techniques.

All work was completed in accordance with the Standard Operating Procedures (SOPs) in Appendix B as well as site safety requirements.

Samples were submitted to General Engineering Laboratories of Savannah, Georgia and TestAmerica Laboratories of Earth City, Missouri. Samples were submitted under chain of custody and samples collected from inside the PA were surveyed by the Health Physics department prior to shipment to the laboratory. Samples were submitted for one or more of the following analyses:

- VOCs, Method 8260C;
- SVOCs, Method 8270D;
- Polychlorinated biphenyls (PCBs), Method 8082A;
- Target Analyte List (TAL) metals, Method 6010C/7471B;
- Synthetic Precipitation Leaching Procedure (SPLP) metals, extraction method 1312 and analysis method 6010C/7470A;
- Toxicity Characterization Leaching Procedure (TCLP) metals, extraction method 1311 and analysis method 6010C/7470A;
- Perchlorate, Method 314.0 Mod;
- Perfluoroalkyl substances (PFAs), Method 537;
- Benzene, toluene, ethylbenzene, xylene, Method 8260B;
- Lead; Method 6010C;

- Naphthalene; Method 8260B;
- Polyaromatic hydrocarbons (PAHs), Method 8270D; and
- Total Petroleum Hydrocarbons – Diesel Range Organics (TPH-DRO), Method 8015C.

Then all sample locations were located using handheld Global Positioning System (GPS) with an accuracy of +/- one foot.

Additional information on the investigation activities or procedures including investigation-derived waste, decontamination, etc. can be found in the Work Plan [1].

## **3.2 DATA QUALITY OBJECTIVES**

Data quality objectives (DQOs) were set in the early stages of the characterization effort to ensure that defensible data was collected to satisfy the requirements of the different regulatory agencies, and their different programs.

### **3.2.1 Quality Assurance/Quality Control**

To meet NDEQ and EPA requirements, duplicate samples were collected at a frequency of 5%, or one duplicate and matrix spike/matrix duplicate samples were collected for every 20 samples submitted for laboratory analysis.

Temperature blanks were included in each shipment and trip blanks accompanied any shipment that contains samples scheduled for analysis of VOCs. Equipment blanks were not required as dedicated equipment was used.

### **3.2.2 Data Validation**

All data was reviewed by a qualified chemist and validated in accordance with NDEQ regulations. At a minimum, data was checked so that the reporting limits are below the NDEQ action levels, and to evaluate that the relative percent differences (RPDs) are below acceptable limits. The data validation reports are included in Appendix C.

## **SECTION 4 CHEMICAL FINDINGS**

This limited non-radiological characterization program focused on seven AOIs, as they had the most potential to impact soils, sediments and groundwater and therefore impact decommissioning costs. This section presents a brief description of each AOI, the COCs, a summary of the investigation and the results compared to NDEQ criteria.

### **4.1 AOI 1 – WATER TREATMENT PLANT**

The original Water Treatment Plant was installed during the initial construction of FCS to supply all the facility's demineralized and domestic water needs. The Water Treatment Plant used river water in its treatment process and all equipment and piping throughout the process was classified as the "Demineralized Water System" and equipment was defined with a "DW" prefix [5]. Little information is available but historical knowledge indicates the system transferred water from the river to a settlement tank within the chemical pump house and there used caustics, acids, and other water treatment chemicals. The water was then sent to two ion exchange resin lagoons to remove other constituents such as metals. The lagoons were unlined and system was connected via a pipe to the turbine building.

During the flood of 1993/94, the lagoons were flooded and washed out. In 2002, the east lagoon was overflowed and the berm between the lagoons had to be cut. Other reports include an ammonia release and an exothermic chemical explosion in the transfer lines going to the Turbine Building. The system was abandoned (circa 1990) when a supply connection was made to the City of Blair's municipal water supply [5]. After abandonment, the ion exchange resin from the lagoons was placed in the landfill (AOI 8).

#### ***Summary of Field Activities***

COCs at AOI 1 include metals from the demineralization process. The limited site investigation included the collection of two soil samples from directly below the lagoons and one soil sample downgradient of the lagoons as identified on Table 2. The plant and lagoons along with the sampling locations are shown on Figure 6 and the boring logs are provided in Appendix D.

**Data Evaluation**

The analytical results from the soil sampling as shown below indicate elevated arsenic greater than the NDEQ VCP Remedial soil criteria, however, the results are consistent or below background arsenic values [9]. The results also indicated elevated cobalt, iron, and manganese greater than NDEQ VCP soil criteria, but these too are consistent or below published background values [9]. No other values exceeded NDEQ VCP soil criteria. A more comprehensive list of analytical data for this AOI including TAL metals is provided in Table 3 and the laboratory results are provided in Appendix E.

**Table 4. AOI 1 – Soil Analytical Regulatory Exceedance Summary**

Location Name Sample Depth (bgs)	NDEQ VCP Residential Soil (Sept 2012)	EPA Residential Soil RSL May 2016 HI = 1	DP0101 9-10 (ft)	DP0102 16-17 (ft)	DP0103 7-8 (ft)
<b>Inorganic Compounds (mg/kg)</b>					
Arsenic	0.39	0.68	<b>7.3 J</b>	<b>16.5 J</b>	<b>5.83 J</b>
Cobalt	5.8	23	6.8	11.4	4.28
Iron	14000	55000	17600	27100	10500
Manganese	460	1800	692 J	1050 J	235 J

**NOTES:**

J – estimated value

- Bold values indicate an exceedance of the EPA Residential RSL.

- Gray values indicate an exceedance of the NDEQ VCP Residential Soil Criteria

The soil samples were also analyzed for SPLP analysis to evaluate the potential for metals in soils to impact the groundwater below. Data results for SPLP analysis are below NDEQ VCP groundwater remedial goals (RGs), except for arsenic.

**Findings**

Although several inorganics were reported at concentrations that exceeded both EPA and NQED criteria, these are likely naturally occurring but may have been concentrated during the water treatment activities. Additional evaluations may be warranted to evaluate the concentrations with respect to background conditions.

**4.2 AOI 2 – CHEMICAL STORAGE AREAS**

The site contains two chemical storage buildings. The original chemical storage building and the current chemical storage building. Both are shown on Figure 7. With the exception of the flood in 2010, the site was classified as a Low Quantity Generator, and therefore did not require a Greater than 90 Day RCRA Storage Area.

The original storage building was located within the PA houses the hazardous waste. This building known as the Hazardous Material Storage Building (also known as Hazmat Shed) is located adjacent to and west of the Old Warehouse [5]. This building continues to store chemicals and hazardous waste. The building floor lies directly on the soils (i.e. “slab on grade”) and there are no floor drains. During interviews, it was

noted that during past operations, if the building was filled the hazardous materials would be placed outside the building to await off-site disposal. There are also accounts of the area being flooded, offering the potential for chemicals to be discharged to the soils outside the doorways.

The second chemical storage building is a more recent structure that is located outside of the PA to the north of the Switchyard and northeast of the Old Warehouse. This building is known to store chemicals, but not hazardous wastes. Additional information on the chemicals stored in this building were not available, but it is anticipated that lubricants, degreasers, hydraulic fluids, etc. are stored here. There are also accounts of numerous drums of materials being stored in this area, prior to offsite disposal.

## Summary of Field Activities

COCs for AOI 2 include VOCs, SVOCs, TAL metals, and PCBs. The limited site investigation included the collection of two soil samples from the former and current chemical storage building areas as identified on Table 2. The sampling locations are shown on Figure 7 and the boring logs are provided in Appendix D.

## Data Evaluation

The analytical results from the soil sampling as shown below indicate elevated arsenic, cobalt, iron, and manganese greater than the NDEQ VCP soil criteria, however, the results are consistent or below background values [9]. No other values exceeded NDEQ VCP soil criteria. A more comprehensive summary of the analytical data for this AOI including VOCs, SVOCs, SPLP Metals, and PCBs is provided in Table 3 and the laboratory results are provided in Appendix E.

**Table 5. AOI 2 – Soil Analytical Regulatory Exceedance Summary**

Location Name Sample Depth (bgs)	NDEQ VCP Residential Soil (Sept 2012)	EPA Residential Soil RSL May 2016 HI = 1	DP0201 14-15 (ft)	DP0202 7-8 (ft)	DP0202 9-10 (ft)	DP0203 12-13 (ft)	DP0204 13-14 (ft)
<b>Inorganic Compounds (mg/kg)</b>							
Arsenic	0.39	0.68	<b>3.82 J</b>	<b>13.9 J</b>	<b>8.09 J</b>	<b>9.96 J</b>	<b>9.22 J</b>
Cobalt	5.8	23	2.23	7.21	4.33	8.31	5.63
Iron	14000	55000	5510	19500	12200	23900	13900
Manganese	460	1800	115 J	646 J	348 J	461 J	396 J

### NOTES:

J – estimated value

- Bold values indicate an exceedance of the EPA Residential RSL.

- Gray values indicate an exceedance of the NDEQ VCP Residential Soil Criteria

The soil samples were also analyzed for SPLP analysis to evaluate the potential for metals in soils to impact the groundwater below (see Table 3). Data results for SPLP analysis are below NDEQ VCP groundwater RGs, except for arsenic and selenium.

***Findings***

Based on the materials stored at AOI 2, the inorganics detected at concentrations above the EPA and NDEQ criteria are likely attributed to natural background conditions. These naturally elevated background conditions also would account for the elevated SPLP results for arsenic. Additional evaluations may be warranted to evaluate the concentrations with respect to background conditions.

**4.3 AOI 5 – SPARE TRANSFORMER**

The spare transformer is located just off the main plant entrance road and south of the Switchyard. Drawings indicate that two spare transformer pads were constructed in 2002 and 2005, respectively [12]. One is currently in use and houses a spare T1 transformer which was placed on the pad in approximately 2006. During the flood of 2011, the spare transformer was surrounded by an unlined earthen berm covered with crushed rock. This area is shown on Figure 8.

During transportation of the spare transformer, it has been reported that the load was dropped, potentially causing a minor release of non-PCB oils. The area was cleaned up and stained soils removed, but no confirmation soil samples were collected.

During the site walk down in September 2016, it was noted that the spare transformer was visibly leaking oil onto the pad/ground. This is supported by multiple condition reports (CRs) that report similar findings. It is unknown how long this transformer has been leaking or if the non-PCB oil transformer oil contains residual PCBs.

***Summary of Field Activities***

COCs for AOI 5 include SVOCs and PCBs. The limited site investigation included the collection of one soil sample within the berm where the transformer was leaking, one soil sample around the berm, and one soil sample from the location of the where the spare transformer was dropped as identified on Table 2. The sampling locations are shown on Figure 8 and the boring logs are provided in Appendix D.

***Data Evaluation***

The analytical results from the soil sampling did not exceed NDEQ VCP soil criteria. A summary of the analytical data is provided in Table 3 and the laboratory results are provided in Appendix E.

***Findings***

No further actions are warranted at this AOI.

**4.4 AOI 6 – USTS**

Based on Site documentation [10], three underground storage tanks (USTs) exist on the Site outside of building structures. All three USTs are diesel generator fuel-oil tanks located within the PA. These are:

- Tank FO-1 – 18,000-gallon diesel; single-walled steel tank; located south of the Auxiliary Building
- Tank FO-10 – 18,000-gallon diesel; single-walled steel tank; located between the Intake Structure and the Service Building.

- Tank FO-32 - 4,000-gallon diesel; double-walled steel tank with interstitial monitoring; located south of the New Warehouse

Each of these tanks are shown on Figure 8 and listed on the table below.

Based on the Pollution Prevention Storm Water Management Plan [11], the tanks are installed within compacted soil. Periodic surveillance testing is conducted on these tanks. This testing includes water content and recording level readings.

**Table 6. AOI 6 - USTs**

Tank	Size (Gallons)	Type of Fuel	Location
FO-1	4/12/1949	Diesel	South of Auxiliary Building
FO-10	4/12/1949	Diesel	East of Service Building
FO-32	12/13/1910	Diesel	South of New Warehouse

## Summary of Field Activities

During the site walk down, it was reported that the none of the tanks had ever had a leak but it was possible for them to be overfilled, with residual potentially impacting the adjacent soils. Groundwater wells installed near the USTs have not been tested for non-radiological COCs, however the boring logs do not report staining or odors.

COCs for AOI 6 include TPHDRO. The limited site investigation included the collection of one soil sample from the downgradient edge of each UST as identified on Table 2. The sampling locations are shown on Figure 9 and the boring logs are provided in Appendix D.

## Data Evaluation

The analytical results from the soil sampling did not exceed NDEQ VCP soil criteria. A summary of the analytical data is provided in Table 3 and the laboratory results are provided in Appendix E.

## Findings

This investigation was designed to identify if there were historic releases that impact soils and groundwater downgradient from USTs. Additional samples may be warranted once the USTs are removed. This work should be completed in accordance with the Nebraska Administration Code, Title 159, Chapter 10.

## 4.5 AOI 10 – FIRE TRAINING AREA

The fire training area is located to the west of the equipment storage area in the Switchyard (See Figure 10). Currently the area consists of a concrete pad with a central drain that discharges directly to Fish Creek. The area also contains two sealand containers, a propane tank, a cross pan, and other fire training equipment (fire extinguishers, rest area, etc.). The sealand containers are used to start “live” fires using pallets and straws as the fuel, water is used to extinguish the flames. The propane tank, which was installed approximately 12 years ago, is used to start fires in the cross pan which is then put out with chemical fire

suppressants. It was also reported that during fire training activities the central pad drain is covered, preventing materials from draining to Fish Creek, allowing only rain water and water from the pallet and straw fire suppression activities to drain from the pad.

Prior to use of propane, the cross pan fires were started using diesel fuel. Based on interviews, the fuels were first stored in 55 gallon drums, and later transported in 5 gallon containers. These activities allowed for potential releases of the fuel oils to the pad and soils in the area.

After the fires were extinguished, the extra fuel oil was collected from the cross pan for potential future use and the embers were containerized for off-site disposal. The area was then cleaned by spraying the burn pan and sealand containers with water, where the residual water was then drained to Fish Creek via a drain in the burn pad. Additionally, although the cross pan was covered when not in use, it was possible for rain water to fill or overfill the container, releasing residual oils to the pad, and then to Fish Creek.

The fire extinguishers used for fire prevention training are Aqueous Film Forming Foam (AFFF) dry A/B/C type fire extinguishers. These fire extinguishers are known to contain PFAs or proprietary fluorosurfactants based on the safety data sheets (SDSs). These PFAs are currently recognized by EPA as an emerging compound in the environment.

## Summary of Field Activities

COCs for AOI 10 include PAHs and TAL Metals due to the use of fuel oils and burning of pallets and an additional COC is PFAs or other proprietary fluorosurfactants from fire suppressant use. The primary migration path for these COCs is via the drain to Fish Creek, potentially impacting the sediments and surface water, but there is also potential for COCs to impact the soils below the drain (if the seals leaked) as well as the area where the fuel oils were stored. The limited site investigation included the collection of three soil samples and one downgradient groundwater sample as identified on Table 2. The sampling locations are shown on Figure 10 and the boring logs are provided in Appendix D.

## Data Evaluation

The analytical results from the soil sampling as shown below indicate elevated arsenic, cobalt, and iron, greater than the NDEQ VCP soil criteria, however, the results are consistent or below background values [9]. No other values exceeded NDEQ VCP soil criteria. A more comprehensive summary of the analytical data for this AOI including SVOCs is provided in Table 3 and the laboratory results are provided in Appendix E.

**Table 7. AOI 10 – Soil Analytical Regulatory Exceedance Summary**

Location Name Sample Depth (bgs)	NDEQ VCP Residential Soil (Sept 2012)	EPA Residential Soil RSL May 2016 HI = 1	DP1001 13-14 (ft)	DP1002 12-13 (ft)	DP1003 10-11 (ft)
<b>Inorganic Compounds (mg/kg)</b>					
Arsenic	0.39	0.68	<b>9.86 J</b>	<b>5.82 J</b>	<b>6.63 J</b>
Cobalt	5.8	23	6.8	9.87	5.83
Iron	14000	55000	15300	13700	12500

**NOTES:**

J – estimated value

- Bold values indicate an exceedance of the EPA Residential RSL.
- Gray values indicate an exceedance of the NDEQ VCP Residential Soil Criteria

The analytical results from the groundwater sampling did not exceed (MCLs and the VOC analysis was completed outside of the holding time due to insufficient preservative within the sample and was qualified. It should be noted that the combined detections of PFAs did exceed the EPA May 2016 Health Advisory. A summary of the groundwater analytical data is provided in Table 7 and the laboratory results are provided in Appendix E.

### **Findings**

Data from this AOI indicate groundwater impacts from the historic fire training activities. As PFAs are now recognized as an emerging compound and may require remediation (depending on the extent and concentrations). Additional investigations to determine the lateral and vertical extent of these compounds in the environment may be warranted.

## **4.6 AOI 11 – FIRING RANGE**

The firing range is located north of the PA (Figure 11). The firing range consists of three berms and a shelter area. On the south corner of the firing range is a tower used for rifle practice, and there is a simulated indoor or obstructed view scenario practice area in the northeast corner. This area has formed ‘hallways’ out of soil filled stacked tires. The target line for hand gun firing is plant south to plant north and the target line for rifle firing is plant southwest to plant north east.

When the plant was originally constructed the firing range was reported to consist of one berm, identified as a “hill” running plant east-west. Then in the late 1980’s the current firing range was built. Interviews conducted indicated that after its completion, law enforcement agencies also used the facility for weapons training. Reportedly, they used to take care in picking up the spent casings, but over time this practice was discontinued with reports of spent casings on the ground. Currently the area is well maintained, with only with some shells remaining.

The bullets used at the firing range are indicated to be “normal” bullets. Bullets are known to contain lead and lesser concentrations of other metals. Other COCs include perchlorate, as it is commonly used as a stabilizer in the smokeless powder.

A recent lead assessment completed by B2 Engineering in August of 2014 on the exterior sides of the plant north and plant east berms indicate levels of high lead in the exterior of the north berm. The levels range from 42.2 to 5335.7 parts per million (ppm) which is equivalent to milligrams per kilogram (mg/kg) (exceeding the industrial soil criteria of 750 mg/kg [7] and reported TCLP values up to 150 milligrams per liter (mg/L), exceeding the Hazardous Waste Criteria of 5 mg/L [40 CFR 261.24]). These elevated samples were collected from the outside and norther side of the berm, suggesting that during the last construction (to create the three berms) soils were likely reworks. No samples were collected from the inside of the berms, or from the shooting range floor.

The shelter at the firing range is used for cleaning guns in addition to acting as an office. The shelter stores small containers of gun cleaners and most of the cleaning is conducted on tables places under the overhangs

along both side of the shelter. There is also a transformer located at the southwest corner outside the range and shelter. This transformer was flooded in 2010, potentially releasing oils and residual PCBs to the soils.

## Summary of Field Activities

COCs for AOI 11 include lead and other metals impacts in the berms (and soils within the rubber tires for the indoor/obstructed view training area) as well as metal and perchlorate in the shallow soils on the floor of the range. The limited site investigation included the collection of soil samples at two locations every two feet (up to 8 feet below ground surface) and at the water table. We also collected two surface soil samples and one downgradient groundwater sample as identified on Table 2. The sampling locations are shown on Figure 11 and the boring logs are provided in Appendix D.

## Data Evaluation

The analytical results from some of the soil sampling as shown below indicate elevated arsenic, cobalt, iron, greater than the NDEQ VCP soil criteria, however, the results are consistent or below background values [9]. Additionally, the surface soil sample from within the firing range indicates elevated lead greater than the NDEQ VCP soil criteria. No other values exceeded NDEQ VCP soil criteria. A more comprehensive summary of the analytical data is provided in Table 3 and the laboratory results are provided in Appendix E.

**Table 8. AOI 11 – Soil Analytical Regulatory Exceedance Summary**

Location Name Sample Depth (bgs)	NDEQ VCP Residential Soil (Sept 2012)	EPA Residential Soil RSL May 2016 HI = 1	DP1101 0-1 (ft)	SS1101 0-0.5 (ft)	SS1102 0-0.5 (ft)
<b>Inorganic Compounds (mg/kg)</b>					
Arsenic	0.39	0.68	--	<b>4.5 J</b>	<b>11.9 J</b>
Cobalt	5.8	23	--	3.72	10.4
Iron	14000	55000	--	--	18300
Lead	400	400	<b>2230 J</b>	--	--
Manganese	1800	460	--	294 J	853 J

### NOTES:

J – estimated value

- Bold values indicate an exceedance of the EPA Residential RSL.

- Gray values indicate an exceedance of the NDEQ VCP Residential Soil Criteria

The analytical results from the groundwater sampling as shown below indicated elevated arsenic, barium, chromium, and lead greater than the MCLs and these four compounds plus aluminum, cobalt, iron, manganese, and vanadium are greater than the NDEQ VCP Groundwater Remedial Goals (RGs). A summary of the groundwater analytical data is provided in Table 10 and the laboratory results are provided in Appendix E.

**Table 9. AOI 11 - Groundwater Analytical Regulatory Exceedance Summary**

Location Name	MCL	NDEQ VCP Groundwater RGs Sept 2012	GW1101
<b>Inorganic Compounds (ug/L)</b>			
Aluminum, Total	NA	50	360000 J-
Arsenic, Total	10	50	<b>550 J-</b>
Barium, Total	2000	2000	<b>19000 J-</b>
Chromium, Total	100	100	<b>1700 J-</b>
Cobalt, Total	NA	2.7	600 J-
Iron, Total	NA	300	1100000 J-
Lead, Total	15	15	<b>730 J-</b>
Manganese, Total	NA	50	27000 J-
Vanadium, Total	NA	38	1400 J-

**NOTES:**

- Gray indicates an exceedance of the NDEQ VCP Groundwater RGs

- Bold values indicate an exceedance of the MCL.

**Findings**

The inorganics detected at concentrations above the EPA and NDEQ criteria (other than lead) are likely attributed to natural background conditions and are consistent with inorganics on other portions of the site. These naturally elevated background conditions also would account for some of the elevated constituent concentrations of inorganics in water. Additional evaluations may be warranted to evaluate the concentrations in both soil and groundwater with respect to background conditions.

For the lead detections in soil, data from this AOI coupled with past investigations on the concentrations of lead and historical and current use of the area as a firing range, indicate soil impacts are present with concentration of lead that exceed the Hazardous Waste Criteria of 5 mg/L [40 CFR 261.24]). Due to these levels of lead, additional evaluations are warranted to confirm the nature and extent of lead. Additionally, a risk assessment to confirm that no exposure pathways for human health exist, as well as an ecological evaluation should be considered. Note that only slightly increases levels of lead, when compared to other areas of the site, were seen in the wetlands (see AOI 14).

The site controls access to the public, however, in addition to these additional characterization efforts, an industrial hygienist should be consulted regarding site personal who may come in direct contact with soils as regulatory requirement for lead workers may need to be implemented.

Finally, lead was also detected in groundwater. However, the extent of groundwater impacted by lead should be investigated to better understand the lateral and vertical distribution within the aquifer.

#### 4.7 AOI 14 – FISH CREEK AND WETLANDS

Fish Creek runs along the north side of the PA from the hills towards the Missouri River. Prior to discharging to the Missouri River, Fish Creek lets out into a wetlands area located north of the plant. The topography of the site is such that runoff from the farmland runs into Fish Creek (see Figure 12). Additionally, Fish Creek receives storm water runoff from the fire training area, Switchyard, firing range, and the plant.

##### Summary of Field Activities

COCs for AOI 14 PAHs, PFAs, TAL Metals, and VOCs including perchlorate from the runoff and direct discharges from several other AOIs. The limited site investigation included the collection of three sediment samples along the creek bed. The sampling locations are shown on Figure 12 and the boring logs are provided in Appendix D.

##### Data Evaluation

The analytical results from the sediment sampling as shown below indicate elevated arsenic, cobalt, iron and manganese greater than the NDEQ VCP soil criteria; however, the results are consistent or below background values [9]. PAHs and PFAS were also detected in sediments, but at concentrations below NDEQ VCP soil criteria. It should be noted that since PFAs are recently considered an emerging contaminant, no NDEQ VCP soil criteria has been established. No other values exceeded NDEQ VCP soil criteria. A summary of the sediment analytical data is provided in Table 11 and the laboratory results are provided in Appendix E.

**Table 12. AOI 14 - Sediment Analytical Regulatory Exceedance Summary**

Location Name Sample Depth (bgs)	NDEQ VCP Residential Soil (Sept 2012)	EPA Residential Soil RSL May 2016 HI = 1	SD1401 0 - 0.5 (ft)	SD1401 0 - 0.5 (ft)	SD1402 0 - 0.5 (ft)	SD1403 0 - 0.5 (ft)
<b>Inorganic Compounds (mg/kg)</b>						
Arsenic	0.39	0.68	<b>10.9 J</b>	<b>11.4 J</b>	<b>9.95 J</b>	<b>12.3 J</b>
Cobalt	5.8	23	9.26	9.36	9.96	9.08
Iron	14000	55000	19800	19500	21100	19800
Manganese	460	1800	706 J	668 J	784 J	663 J

**NOTES:**

J – estimated value

- Bold values indicate an exceedance of the EPA Residential RSL.

- Gray values indicate an exceedance of the NDEQ VCP  
Residential Soil Criteria

##### Findings

Although several inorganics were reported at concentrations that exceeded both EPA and NQED criteria, these are likely attributed to natural background conditions. Additionally, the other analytical data to not

exceed soil screening criteria and to not pose a risk to the public, however, organics should be evaluated in the context of ecological receptors to identify if they could be bioaccumulated.

#### **4.8 AOI 15 – FARMLANDS**

Farmlands surround the plant to the north and south. These farmlands are leased to local farmers for use. Typical farming practices include the use of pesticides, herbicides, arsenic, and fertilization to assist in crop production. It is unknown what chemicals or practices were used on the surrounding farmlands.

Additionally, farming uses tractors and other equipment. It was reported that there was a diesel aboveground storage tank (AST) installed to refuel his equipment. When observed, there were also containers stored in this area. OPPD had the tank and containers removed, however it is not documented how long the area was in use or if any releases associated with this AST occurred. The location is shown on Figure 13.

##### ***Potential source area and migration pathway to impact soils, sediments, or groundwater***

Due to the common practice of releasing small quantities of materials when fueling, shallow soils and groundwater may be impacted by the diesel. As numerous containers were also stored there, additional COCs could include VOCs, SVOCs, metals as well as pesticides.

##### ***Summary of Field Activities***

COCs for AOI 15 included diesel, VOCs, SVOCs, metals as well as pesticides. The limited site investigation intended to collect one soil sample from this location. However, because personnel at FCS were not able to identify an approximate location of this tank, the sample was not completed at the request of the facility.

##### ***Findings***

No further actions are warranted at this time.

**SECTION 5 CONCLUSIONS**

Based on the findings of this investigation, there are only two AOIs where chemical or non-radiological constituents have impacted environmental media.

- AOI 10 - Fire Training Area has PFAOs in excess of the EPA Health Advisory standard of 0.07 micrograms per liter. PFAs do not have a NDEQ criteria, but have been identified recently by EPA as an emerging compound, with a Health Advisory number for drinking water already in effect.
- AOI 11 - Firing Range has lead in the berm and in groundwater. Previous soils data, collected from the north side of the berm, indicated elevated concentrations of lead, that were above the EPA hazardous threshold of 5 mg/L, as analyzed by TCLP. These data were consistent on the southern site of the berm with impacts soils extending to 2 feet bgs. Groundwater grab samples, collected from GW1101 on the downgradient site of the Firing Range also reported lead. It should be noted that the impacted media has not been fully delineated, and will most likely require mitigation and remediation to meet site closure requirements.

Other constituents including arsenic, cobalt, iron, and manganese were noted to have exceedances in soil that exceeded NDEQ criteria. These exceedances occurred in most of the metal samples, but based on a review of published background data [9], these results are consistent with the published values and the samples fall within the same range. Therefore, we do not believe that these elevated levels are due to site conditions, but background levels for the area should be confirmed.

**SECTION 6 RECOMMENDATIONS**

Based on the limited non-radiological characterization effort, AOIs 10 and 11 show site-related contaminants impacting soils and/or groundwater. It should be noted that the purpose of this investigation was to identify if COCs were released to the environment, and now additional efforts should be completed to delineate the horizontal and vertical extents of these contaminant, and if warranted, remediate impacted areas in accordance with the NDEQ VCP requirements.

It is also recommended that site background levels be established to confirm the data collected to date is consistent with site background values. Additionally, the remaining AOIs should be characterized to support site closure, although based on these findings as well as the current groundwater data set, impacts (if present) are likely to be minimal.

**ABBREVIATIONS AND NOTES:**

-: Not Analyzed  
bgs: below ground surface  
ft: feet  
HI: Hazard Index  
mg/kg: milligram per kilogram  
mg/L: milligram per liter  
NA: Not Applicable  
NDEQ: Nebraska Department of Environmental Quality  
RSL: Regional Screening Level  
VCP: Voluntary Cleanup Program

**QUALIFIERS:**

< 2.5: Not detected, value is the laboratory reporting limit  
J: value is estimated.  
J-: value is estimated with a potential low bias  
J+: value is estimated with a potential high bias

- Volatile and Semi-Volatile Organic analytes detected in at least one sample are reported herein. For a complete list of analytes see the laboratory data sheets.
- Bold values indicate an exceedance of the Residential RSL.
- Shaded values indicate an exceedance of the Nebraska VCP Residential Soil Criteria.

Notes																			
<sup>1</sup> Toxicity factors selected based on the hierarchy described in EPA's "Memorandum Regarding Human Health Toxicity Values in Superfund Risk Assessments." From Michael B. Cook, Director, EPA Office of Superfund Remediation and Technology Innovation. To EPA Superfund National Policy Managers, Regions 1 - 10. OSWER Directive 9285.7-53. December 5, 2003. On-Line Address: <a href="http://www.epa.gov/oerpape/superfund/programs/risk/hhmemo.pdf">http://www.epa.gov/oerpape/superfund/programs/risk/hhmemo.pdf</a>																			
EPA Region 3 Risk-Based Concentrations (RBC) Table. Last update: April 14, 2004. On-Line Address: <a href="http://epa.gov/reg3hwmd/risk/human/index.htm">http://epa.gov/reg3hwmd/risk/human/index.htm</a>																			
EPA Region 6 Human Health Medium-Specific Screening Levels (MSSL) Table. Last update: Janary 13, 2004. On-Line Address: <a href="http://www.epa.gov/earth1r6/6pd/rcra_c/pd-n/screen.htm">http://www.epa.gov/earth1r6/6pd/rcra_c/pd-n/screen.htm</a>																			
EPA Region 9 Preliminary Remediation Goals (PRG) Table. Last update: October 1, 2002. On-Line Address: <a href="http://epa.gov/region09/waste/sfund/prg/index.htm">http://epa.gov/region09/waste/sfund/prg/index.htm</a>																			
<sup>**</sup> RGs for ammonia were established by NDEQ policy decision based on the ready conversion of ammonia to nitrite and nitrate via chemical nitrification, the lack of an MCL for ammonia, and the established MCL for nitrate.																			
<sup>+++</sup> Designations (see Appendix A, Protocol for VCP Remediation Goal Lookup Tables, Nebraska Voluntary Cleanup Program for more information):																			
Cadmium and compounds: RfDo is value for water.																			
Total Chromium (1:6 ratio Cr VI:Cr III): IRIS IUR for Chromium VI used (since IRIS IUR is based on a 1:6 ratio of chromium VI:chromium III).																			
Chromium VI: IUR is IRIS value for Chromium VI multiplied by 7 (since IRIS IUR is based on a 1:6 ratio of chromium VI:chromium III).																			
Lead: VCP RGs calculated using EPA's Integrated Exposure Uptake Biokinetic (IEUBK) Model																			
Manganese (non-food): RfDo reflects IRIS RfDo for manganese divided by 3, which reflects subtraction of dietary sources of manganese.																			
Thallium and compounds: RfDo is IRIS RfDo for thallium sulfate adjusted for the molecular weight of thallium																			
Vinyl chloride (residential): SFo and IUR are IRIS values based on continuous lifetime exposure from birth, derived using the linearized multistage (LMS) method.																			
Vinyl chloride (industrial): SFo and IUR are IRIS values based on continuous lifetime exposure during adulthood, derived using the linearized multistage (LMS) method.																			

**Appendix B      Standard Operating Procedures**

## 1.1 UTILITY CLEARANCE

### INTRODUCTION

Invasive field investigation activities such as drilling, soil gas surveys, test excavation or remedial construction activities require location of underground utilities prior to initiating work. Such clearance is sound practice in that it minimizes the potential for damage to underground facilities and more importantly, is protective of the health and safety of personnel. Under no circumstances will invasive activities be allowed to proceed without obtaining proper utility clearance by the appropriate public agencies and/or private entities. **This clearance requirement applies to all work on both public and private property, whether located in a dense urban area or a seemingly out-of-the-way rural location.**

The responsibility of obtaining this clearance lies with the Consultant or Contractor performing the work.

In most states such utility clearance is required by law, and obtaining clearance includes contacting a public or private central clearance agency via a “one-call” telephone service and providing them with proposed exploration location information. This is discussed in more detail herein. It is important to note that public utility agencies may not, and usually don’t have information regarding utility locations on private property. As such, utility clearance at the Zion Nuclear Power Station must be cleared using available site drawings, and written approval must be obtained from plant personnel with appropriate knowledge of existing utilities.

### PROCEDURES REFERENCED

- 2.2 Soil Borings

### PROCEDURE

- Before marking any proposed exploration or underground construction locations, it is critical that all readily-available information on underground utilities and structures be obtained. This includes publicly-available information as well as information in the possession of private landowners. Any drawings obtained must be reviewed in detail for information pertaining to underground utilities.
- Using the information obtained, the site should be viewed in detail for physical evidence of buried lines or structures, including pavement cuts and patches,

variation in or lack of vegetation, variations in grading, etc. (Care must also be taken to avoid overhead utilities as well). Presence of surface elements of buried utilities should be documented, such as manholes, gas or water service valves, catch basins, monuments or other evidence.

- Overhead utility lines must be taken into account when choosing exploration and excavation locations. Most states require a minimum of 10 ft. of clearance between equipment and energized wires. Such separation requirements may also be voltage-based and may vary depending on state or municipality regulations.

In evaluating clearance from overhead lines, the same restrictions may apply to “drops”, or wires on a utility pole connecting overhead and underground lines.

- Using the information obtained and observations made, *proposed* exploration or construction locations should be marked in the field. Marking locations can be accomplished using spray paint on the ground, stakes, or other means. **All markings of proposed locations should be made in white**, in accordance with the generally-accepted universal color code for facilities identification (AWMA 4/99):

- White: Proposed Excavation or Drilling location
- Pink: Temporary Survey Markings
- Red: Electrical Power Lines, Cables, Conduit and Lighting Cables
- Yellow: Gas, Oil, Steam, Petroleum or Gaseous Materials
- Orange: Communication, Alarm or Signal Lines, Cables or Conduits
- Blue: Potable Water
- Purple: Reclaimed Water, Irrigation and Slurry Lines
- Green: Sewers and Drain Lines

- In order to effectively evaluate the proposed locations with these entities, detailed, accurate measurements between the proposed locations and existing surface features should be obtained. Such features can be buildings, street intersections, utility poles, guardrails, etc.
- Obtaining the utility clearance generally involves two entities:
  - The designated “One-Call” underground facilities protection organization for the area; and
  - The landowner.

Both entities must be contacted and the proposed locations evaluated in light of information available for existing underground facilities. The detailed measurement information described above will be required by the “one call” agency. The owners of the applicable, participating underground utilities are obligated to mark their respective facilities at the site in the colors described

above. Utility stake-out activities will typically not commence for approximately 72 hours after the initial request is made.

- The public and private utility entities generally only mark the locations of their respective underground facilities within public rights-of-way. Determination of the locations of these facilities on private property will be the responsibility of the project Consultant or Contractor. If available information does not contain sufficient detail to locate underground facilities with a reasonable amount of confidence, alternate measures may be appropriate, as described below. In some cases, the memory of a long-time employee of a facility on private property may be the best or only source of information. It is incumbent on the Consultant or Contractor to exercise caution and use good judgement when faced with uncertainty.
- **Notes: It is important to note that not all utilities are participants in the “one-call” agency or process. As such, inquiries must be made with the “one-call” agency to determine which entities do not participate, so they can be contacted independently.**

**Most utility Stake-outs have a limited time period for which they remain valid, typically two to three weeks. It is critical that this time period be taken into account to prevent expiration of clearance prior to completion of the invasive activities, and the need to repeat the stake-out process.**

- Care must be exercised to document receipt of notice from the involved agencies of the presence or absence of utilities in the vicinity of the proposed locations.

Most agencies will generally provide a telephone or fax communication indicating the lack of facilities in the project area. **If contact is not made by all of the agencies identified by the “one-call” process, do not assume that such utilities are not present. Re-contact the “one-call” agency to determine the status.**

- For complicated sites with multiple proposed locations and multiple utilities, it is advisable to arrange an on-site meeting with utility representatives. This will minimize the potential for miscommunication amongst the involved parties.
- Completion of the utility stake out process is not a guarantee that underground facilities will not be encountered in excavations or boreholes; in fact, most “one-call” agencies and individual utilities do not offer guarantees, nor do they accept liability for damage that might occur. Accordingly, it is advisable that any invasive activities proceed with extreme caution in the upper four to five feet in the event the clearance has failed to identify an existing facility. This may necessitate hand-excavation or probing to confirm potential presence of shallow

utilities. If uncertainty exists for any given utility, extra activities can be initiated to solve utility clearance concerns. These options include:

- Hand digging, augering or probing to expose or reveal shallow utilities and confirm presence and location. In northern climates this may require advancing to below frost line, typically at least four feet.
- Screening the proposed work areas with utility locating devices, and/or hiring a utility locating service to perform this task. The private utility locating service is a growing industry that has formed a national organization. The National Utility Locate Contractors Association (NULCA) can be reached at 715-635-6004.

## **EQUIPMENT**

- White Spray paint
- Wooden stakes, painted white or containing white flagging
- Color-code key
- Available drawings

## **1.2 FIELD DATA RECORDING – FIELD BOOKS, LOG FORMS AND ELECTRONIC DATA**

### **INTRODUCTION**

This procedure describes protocol for documenting standard investigation activities in the field. Field data serves as the cornerstone for an environmental project, not only for site characterization but also for additional phases of investigation or remedial design. Inaccurate or incomplete field data may create significant problems and additional project costs. In addition, recorded field data becomes a legal record of project work, and should be approached with that in mind. Producing legally defensible data includes proper and appropriate recording of field data as it is obtained in a manner that will preserve it for future use.

This procedure provides guidelines for accurate, thorough collection and preservation of written and electronic field data.

### **PROCEDURES REFERENCED**

- 6.0 Field Instruments - Use And Calibration

### **PROCEDURE**

Typical field data to be recorded generally includes, but is not limited to, the following:

- general field observations;
- numeric field measurements and instrument readings;
- quantity estimates;
- sample locations and corresponding sample numbers;
- relevant comments and details pertaining to the samples collected;
- documentation of activities, procedures and progress achieved;
- contractor pay item quantities;
- weather conditions;
- a listing of personnel involved in site-related activities;
- a log of conversations, site meetings and other communications; and
- field decisions made and pertinent information associated with the decisions.

#### **Written Field Data**

Written field data is generally recorded on one of two media: A standardized, pre-printed field log form, or a bound field log book. In general, use of a field log form is preferable as it prompts field personnel to make appropriate observations and record data in a standardized format. This promotes completeness and consistency from one person to the next.

In the absence of an appropriate pre-printed form, the data should be recorded in an organized and structured manner in a dedicated project field log book. Log books must be hard-cover, bound so that pages cannot be added or removed, and should be made from high-grade 50% rag paper with a water-resistant surface.

The following are guidelines for use of field log forms and log books:

1. Information must be factual and complete. Do not abbreviate.
2. All entries will be made in black indelible ink with a ballpoint pen and will be written legibly. Do not use “rollerball” or felt tip-style pens, since the water-soluble ink can run or smear in the presence of moisture.
3. All pages in a log book must be consecutively numbered. Field log forms should also be consecutively numbered.
4. Each day’s work must start a new log book page.
5. At the end of each day, the current log book page must be *signed and dated* by the field personnel making the entries.
6. When using field log forms, they must also be *signed and dated*.
7. Make data entries immediately upon obtaining the data. Do not make temporary notes in other locations for later transfer to log forms or log books; this only increases the potential for error or loss of data.
8. Entry errors are to be crossed out with a single line, dated and initialed by the person making the correction.
9. Do not leave blanks on log forms, if no entry is applicable for a given data field, indicate so with “NA” or a dash (“--”).
10. At the earliest practical time, photocopies of log forms and log book pages should be made and placed in the project file as a backup in the event the book or forms are lost or damaged.
11. Log books should be dedicated to one project only, i.e., do not record data from multiple projects in one log book.

## **Electronic Data**

Electronic data recording is widely used in environmental investigation and remediation projects. In general, it involves electronic measurement of field information through the use of monitoring instruments, sensors, gauges, and equipment controls. The following is a list of guidelines for proper recording and management of electronic field data:

1. Field data management should follow requirements of a project-specific data management plan (DMP), if one exists.
2. Use only instruments that have been calibrated in accordance with manufacturer's recommendations.
3. Personnel properly trained and experienced in the use of the equipment and software should only perform usage of instruments, controls and computers for the purpose of obtaining field data.
4. Use only fully licensed software on PCs and laptops.
5. Loss of electronic files may mean loss of irreplaceable data. Every effort should be made to back up electronic files obtained in the field as soon as practical. A backup file placed on a disk and kept in a separate location from the original will minimize the potential for loss.
6. Electronic files, once transferred from field instruments or laptops to office computers, should be protected if possible to prevent unwanted or inadvertent manipulation or modification of data. Several levels of protection are usually available for spreadsheets, including making a file "read-only" or assigning a password to access the file.
7. Protect floppy disks from exposure to moisture, excessive heat or cold, magnetic fields, or other potentially damaging conditions.
8. Remote monitoring is often used to obtain stored electronic data from site environmental systems. A thorough discussion of this type of electronic field data recording is beyond the scope of this SOP. Such on-site systems are generally capable of storing a limited amount of data as a comma-delimited or spreadsheet file. Users must remotely access the monitoring equipment files via modem or other access, and download the data. In order to minimize the potential for loss of data, access and downloading of data should be performed frequently enough to insure the data storage capacity of the remote equipment is not exceeded.

## **EQUIPMENT**

- 5” by 7” National 407 Field Book, with high-grade 50% rag paper with water-resistant surface, hard-cover, or equivalent;
- Appropriate field log forms;
- Indelible ball point pen (do not use “rollerball” or felt-tip style pens);
- Straight edge;
- Pocket calculator;
- Laptop computer (if required).

## **REFERENCES**

## 2.1 DRILLING TECHNIQUES/BACKGROUND INFORMATION

### INTRODUCTION

This section will provide a brief description of common methods for conducting subsurface investigations. It should be noted that every drilling technology has its limitations.

### PROCEDURES REFERENCED

- 2.2 Soil Borings
- 3.2 Overburden Wells
- 3.4 Well Development

### DRILLING METHODS

It is important that the drilling method or methods used minimize disturbance of subsurface materials and not contaminate the subsurface and groundwater. The actual drilling method would be dependent upon site-specific geologic conditions. It is important to note that the drilling equipment selected be decontaminated before and between borehole locations to prevent cross contamination (see SOP 7.0). Where possible drilling methods that minimize waste generation (soil cuttings), and waste water generation (decon water), should be selected for investigation/remedial tasks.

In other settings it may be desirable to dictate drilling procedures that minimize turbidity/maximize the ability to achieve sediment-free groundwater. Generally, rotosonic techniques or rotary spun casing techniques achieve these objectives, or oversizing the borehole/sand pack may be considered, as well.

#### Rotosonic Drilling

This method consists of a combination of rotation with high frequency vibration to advance a core barrel to a desired depth. Once the vibration is stopped, the core barrel is retrieved, and the sample is vibrated or hydraulically extracted into plastic sleeves or sample trays. Monitoring wells shall be installed through the outer casing with minimal formation disturbance and mixing of formation materials. Rotosonic drilling generally requires less time than more traditional methods and minimizes soil mixing and soil disturbance (preferred for well locations where low turbidity is an important objective). Continuous, relatively undisturbed samples can be obtained through virtually any formation. Conventional sampling tools can be employed as attachments (i.e., hydropunch, split spoon, shelly tube, etc.). No mud, air, water, or other circulating medium is required. The rotosonic method can drill easily through formations such as

rock, sand, clay, or glacial till. The main limitation of this method is the availability of equipment, the large area required (i.e., drill units are quite large), and costs.

#### Direct Push (Geoprobe™)

Direct push refers to the sampler being “pushed” into the soil material without the use of drilling to remove the soil. This method relies on the amount of the drill weight combined with percussion for advancement of the tool string. Discrete soil samples are continuously obtained as well groundwater and vapor samples can also be collected utilizing this method. Subsurface investigations typically probe to depths of 30 feet or more, although depths will vary based on site-specific geology. This method is used extensively for initial Site screening activities to delineate vertical and horizontal plume presence and can significantly reduce investigative costs. This method is becoming more popular due to the limited cuttings that are produced during the sampling process and the sampling process speed. The use of the Geoprobe™ 6600 also allows for the installation of 2-inch diameter monitoring wells.

#### Rotary Method

This method consists of a drill rod attached to a drill bit (soils: tricone, drag; rock: button studded, diamond studded) that rotates and cuts through the soils and rock. The cuttings produced are forced to the surface between the borehole wall and the drill rod by drilling fluids that generally consist of water, drilling mud, or air. The drilling fluids not only force the cuttings to the surface but also keep the drilling bit cool. Using rotary methods for well installations can be difficult, as it usually requires several steps to complete the installation. First, the borehole is drilled; then temporarily cased; then the well is installed; and then the temporary casing is removed. In some cases, the borehole may remain open without installing a casing but this will only occur in limited instances (i.e., cohesive soils).

##### i) Water Rotary

When using water rotary, the potable water supply shall be analyzed for contaminants of concern. Water rotary is the preferred rotary method since the potable water is the only fluid introduced into the borehole during drilling. However, the use of water as a fluid is generally only successful when drilling in cohesive soils. The use of potable water (only) also reduces well development time, when compared to mud rotary.

##### ii) Air Rotary (typically used in rock)

When using air rotary, the air compressor must have an in-line oil filter system assembly to filter the oil mixed with the air coming from the compressor. This will help eliminate contaminant introduction into the formation. The oil filter system shall be regularly inspected. Air compressors not having an in-line oil filter system are not acceptable for air rotary drilling. A cyclone velocity dissipater or similar air

containment system shall also be used to funnel the cuttings to one location rather than letting the cuttings blow uncontrolled out of the borehole. Air rotary may not be an acceptable method for well installation where certain contaminants are present in the formation. Alternatively, it may be necessary to provide treatment for the air being exhausted from the borehole during the installation process.

### iii) Mud Rotary

Mud rotary is the least preferred rotary method because contamination can be introduced into the borehole from the constituents in the drilling mud (i.e., Ohio, Michigan). The drilling muds are generally non-toxic and do not introduce contaminants into the borehole, however, it is possible for mud to commonly infiltrate and affect water quality by sorbing metals and polar organic compounds. Chemical composition and priority pollutants analysis may be obtained from the manufacturer. Mud rotary shall utilize only potable water and pure (no additives) bentonite drilling muds. The viscosity of the drilling mud shall be kept as low as possible in order to expedite well development. Proper well development is essential to ensure the removal of all the drilling mud and to return the formation to its previously undisturbed state.

### Hollow-Stem Auger

The hollow-stem continuous-flight auger (HSA) is among the most frequently used in the drilling of monitoring wells (overburden wells) or for placement of overburden casings for bedrock wells.

The primary advantages of hollow-stem augering are that:

- generally, no additional drilling fluids are introduced into the formation;
- representative geologic soil samples can be easily obtained using split-spoon samples in conjunction with the hollow-stem augers; and
- monitoring wells can be installed through the augers eliminating the need for temporary borehole casings.

Disadvantages of hollow-stem augering are:

- creates problems for select parameters;
- large volumes of cuttings are typically generated;
- decon is fairly time consuming/labor intensive; and
- relatively slow when compared to direct-push methods (soil sampling tasks).

Installing monitoring wells through hollow-stem augers is a relatively simple process although precautions need to be taken to ensure that the well is properly backfilled. This can be particularly problematic in cases where flowing sand is present.

Hollow-stem augers are available with inside diameters of 2.5, 3.25, 4.0, 4.25, 6.25, 8.25, and 10.25 inches. The most commonly used are 4.25 inches for 2-inch (5 cm) monitoring wells and 6.25 inches for 4-inch (10 cm) monitoring wells. Boreholes can usually be drilled with hollow-stem augers to depths up to 100 feet (30 m) in unconsolidated clays, silts, and sands. Removing augers in flowing sand conditions while installing monitoring wells may be difficult since the augers have to be removed without being rotated. A bottom plug or pilot bit assembly should be utilized to keep out soils and/or water that have a tendency to plug the bottom of the augers during drilling. If flowing sands are encountered, potable water (analyzed once for contaminants of concern) may be poured into the augers to equalize the pressure to keep the formation materials and water from coming up into the auger once the bottom plug is removed.

### Dual-Wall Reverse Circulation Air Method of Drilling

This method consists of two concentric strings of drill pipe (an outer casing and a slightly smaller inner casing). The outer drill pipe is advanced using rotary drilling with a donut-shaped bit attached to the dual casing string cuts an area only the width of the two casings and annulus between. Compressed air is continually forced down the annulus between the inner casing carrying the drill cuttings and groundwater. At the surface, the inner casing is connected to a cyclone hopper where the drill cuttings and groundwater fall out the bottom of the hopper, and air is disbursed out the top. The dual wall provides a fully cased borehole in which to install a monitoring well. The only soil or groundwater materials exposed at any time are those at the drill bit. Therefore, the potential for carrying contamination from one stratum to another is minimal. Depth-specific groundwater samples can be collected during drilling; however, since the groundwater is aerated, analysis for volatile compounds may not be valid.

### Well Points

In some limited cases, well points (sand points) are driven into place without the use of augers. This method provides no information on the geologic condition (other than the difficulty of driving which may be related to formation density). Well points are most often used simply to provide dewatering of a geologic unit prior to excavation in the area. Well points are also used in monitoring shallow hydrogeologic conditions such as in stream beds.

## **2.2 SOIL BORINGS**

### **INTRODUCTION**

The following presents a description of the methods generally employed for the installation of boreholes and the collection of subsurface soil samples. Boreholes are typically installed to define geologic conditions for hydrogeologic and geotechnical evaluation; to allow the installation of monitoring wells and piezometers; and to allow the collection of subsurface soil samples (generally above the water table) for chemical analysis.

Several manual methods are available for the collection of shallow subsurface soil samples (e.g., hand augers, post-hole augers, vibratory hammers). However, the most common methods to advance boreholes are rotosonic drilling techniques, hollow-stem augers (HSA), or the use of a direct-push equipment. SOP 2.1 Drilling Techniques/Background, provides insight into the advantages/disadvantages of these drilling methods.

### **PROCEDURES REFERENCED**

- 1.1 Utility Clearance
- 2.1 Drilling Techniques/Background Information
- 5.1 Soil Sample Collection

### **BOREHOLE REQUIREMENTS**

The following activities must be undertaken prior to installing a borehole.

- i) Obtain a site plan and any previous stratigraphic logs. Determine the exact number and location of boreholes to be installed and the depths of samples for chemical analysis.
- ii) Coordinate lab services including:
  - glassware/sample jars;
  - cooler;
  - shipping details;
  - start date; and
  - expected duration.

- iii) Establish borehole locations in field using available landmark or by surveying methods if necessary.
- iv) Arrange for utility clearance of franchised utilities and site utilities.
- v) Determine notification needs with the Project Manager. Notify the regulatory groups, landowner, facility personnel, and laboratory of the sampling event.
- vi) Determine the methods for handling and disposal of drill cuttings, wash waters, and spent decontamination fluids.

Once the prior planning and preparation activities are completed, the borehole installation and subsurface soil sampling program can proceed. The typical work sequence is as follows:

- locating and marking of borehole locations (if not already completed);
- equipment decontamination;
- final visual examination of proposed drilling area for utility conflicts/final hand auger or post-hole check to verify utility absence;
- advancement of borehole and collection of the soil sample;
- field screening of soil sample;
- description of soil sample;
- sample preparation and packaging;
- abandonment of boreholes;
- surveying of borehole locations and elevations; and
- field note completion and review.

i) Location and Marking of Boreholes/Final Visual Check

The proposed borehole locations marked on the site plan are located in the field and staked. On most sites, this will likely be done several days in advance of the drill rig arriving on site. Unless boreholes are to be installed on a fixed grid, the proposed locations are usually placed at biased locations.

Once the final location for the proposed boring has been selected and utility clearances are complete, one last visual check of the immediate area should be performed before drilling proceeds. This last visual check should confirm the locations of any adjacent utilities (subsurface or overhead) and verification of adequate clearance. If gravity sewers or conduits exist in the area, any access manholes or chambers should be opened and the conduit/sewer alignments confirmed. Do not enter manholes unless confined space procedures are followed.

ii) Borehole Advancement

If possible, it is prudent to use a hand auger or post-hole digging equipment to a sufficient depth to verify the absence of buried utilities and pipelines. This procedure should clear the area to the full diameter of the drilling equipment that will follow. **(Only if underground utilities are suspected in the area, or requested by client.)**

If it is necessary to relocate any proposed borehole due to terrain, utilities, access, etc., the Field Coordinator/Task Manager must be notified and an alternate location will be selected. If moved, details of new location should be recorded in field log book.

Prior to use and between each borehole location at an environmental site, the drilling and sampling equipment must be decontaminated. All decontamination must be conducted in accordance with the project-specific plans or the methods presented in SOP 7.0

The clean augers/tooling are covered with clean plastic sheeting to prevent contact with foreign materials. For geotechnical, geologic, or hydrogeologic studies where contaminants will not be present, it is sufficient to clean the drilling equipment simply by removing the excess soils.

- Collection of soil samples is one of the most important considerations in selecting drilling methods. Therefore, the need for reviewing drilling techniques (SOP 2.1) and the Site objectives must first be considered. Sections iii) and iv) describe borehole soil sampling procedures using direct-push tooling and hollow stem augering/split spoon sampling (Standard Penetration Testing - SPT), respectively.

### iii) Direct-Push/Macro-Core™ Soil Sampler

The operation of the direct-push/Macro-Core™ Soil Sampler (or equivalent) consists of “pushing” the sampler into the subsurface and then retrieved using a direct-push soil probing machine. The collected soil core is contained within an internal soil liner (acetate, polyethylene or Teflon) and removed from the sampler once returned to the ground surface. Sampler length is variable depending on equipment available (2 ft., 4 ft., 5 ft.). Once the soil liner has been removed and the outer sampler de-coned, a new liner is inserted and the sampler reassembled. The clean sampler is then driven back down the same hole to collect the next soil sample.

The Macro-Core™ sampler can be used in either the open-tube or closed-point sampling mode. The open-core sample mode is most commonly used in stable soil conditions. In unstable soils, the piston rod point system prevents collapsed soil from entering the sampler as it is advanced back down the hole. Once at the sample depth, the piston rod is unthreaded and released. The sampler is then driven into the subsurface to fill the sampler with soil, the piston point rides on top of the soil, as it enters the sampler. Once recovered the soil liner with collected soils is opened (cut lengthwise) and examined to collected soil screening information, soil logging information, and soils for chemical analysis.

iv) Standard Penetration Testing (SPT) Sampling and Testing Procedure

This method is used to obtain representative samples of subsurface soil materials and to determine a measure of the in situ relative density of the subsurface soils. The test methods described below must be followed to obtain accurate SPT values. The split spoon is typically driven in advance of a hollow stem auger string which allows collection of the disturbed but representative sample.

SPT sampling is performed by using a split barrel sampler in accordance with ASTM D1586. The split barrel sampler, or split spoon, consists of an 18- or 24-inch long, 2-inch outside diameter tube, which comes apart length-wise into two halves. The split spoon is typically driven in advance of a hollow stem auger string which allows collection of the disturbed but representative soil sample.

Once the borehole is advanced to the target depth and the borehole cleaned of cuttings, representative soil samples are collected in the following manner:

- the split-spoon sampler should be inspected to ensure it is properly cleaned and decontaminated. The driving shoe (tip) should be relatively sharp and free of severe dents and distortions;
- the cleaned split-spoon sampler is attached to the drill rods and lowered into the borehole. Do not allow the sampler to drop onto the soil;
- after the sampler has been lowered to the bottom of the hole, it is given a single blow to seat it and make sure that it is in undisturbed soil. If there still appear to be excessive cuttings in the bottom of the borehole, remove the sampler from the borehole and remove the cuttings; and
- mark the drill rods in three or four successive 6-inch (0.15 m) increments, depending on sampler length, so that the advance of the sampler under the impact of the hammer can be easily observed for each 6-inch (0.15 m) increment.

The sampler is then driven continuously for either 18 or 24 inches (0.45 or 0.60 m) by use of a 140-pound (63.5 kg) hammer. The hammer may be lifted and dropped by either the cathead and rope method, or by using a trip, automatic, or semi-automatic drop system. The hammer should free-fall a distance of 30 inches ( $\pm 1$  inches) (760 mm,  $\pm 25$  mm) per blow. Measure the drop at least daily to ensure that the drop is correct. To ensure a free-falling hammer, no more than 2 1/4 turns of the rope may be wound around the cathead (see ASTM D1586). The number of blows applied in each 6-inch (0.15 m) increment is counted until one of the following occurs:

- a total of 50 blows have been applied during any one of the 6-inch (0.15 m) increments described above;
- a total of 100 blows have been applied;
- there is no advancement of the sampler during the application of ten successive blows of the hammer (i.e., the spoon is "bouncing" on a stone or bedrock); or

- the sampler has advanced the complete 18 or 24 inches (0.45 or 0.60 m) without the limiting blow counts occurring as described above.

In some cases where the limiting number of blow counts has been exceeded, the Consultant may direct the driller to attempt to drive the sampler more if collection of a greater sample length is essential.

On the field form, record the number of blows required to drive each 6-inch (0.15 m) increment of penetration. The first 6 inches is considered to be a seating drive. The sum of the number of blows required for the second and third 6 inches (0.15 m) of penetration is termed the "standard penetration resistance" or the "N-value".

*Note: If the borehole has sloughed and there is caved material in the bottom, the split spoon may push through this under its own weight, but now the spoon is partially "pre-filled". When the spoon is driven the 18 or 24 inches representing its supposedly empty length, the spoon fills completely before the end of the drive interval. Two problems arise:*

- 1. the top part of the sample is not representative of the in-place soil at that depth;*
- 2. the SPT value will be artificially higher toward the bottom of the drive interval since the spoon was packed full. These conditions should be noted on the field log.*

The sampler is then removed from the borehole and unthreaded from the drill rods. The open shoe (cutting end) and head of the sampler are partially unthreaded by the drill crew and the sampler is transferred to the geologist/engineer work surface.

*Note: A table made out of two sawhorses and a piece of plywood is appropriate, or a drum, both covered with plastic sheeting.*

The open shoe and head are removed by hand, and the sampler is tapped so that the tube separates.

*Note: Handle each split spoon with clean disposable gloves if environmental issues are being investigated.*

Measure and record the length of sample recovered making sure to discount any sloughed material that is present on top of the sample core.

Caution must be used when conducting SPT sampling below the groundwater table, particularly in sand or silt soils. These soils tend to heave or "blow back" up the borehole due to the difference in hydraulic pressures between the inside of the HSA and the undisturbed soil. To equalize the hydraulic pressure, the inside of the HSA must be filled with water or drilling mud. The drilling fluid level within the boring or hollow-stem augers needs to be maintained at or above the in situ groundwater level at all times during drilling, removal of drill rods, and sampling. Since heave or blow back is not always

obvious to the driller, it is essential that the water level in the borehole always be maintained at or above the groundwater level. Heaving conditions and the use of water or mud should be noted on the field logs.

SPT sampling below the water table in sands and silt occasionally results in low SPT values being obtained due to the heaving effect disturbing the soil especially if the water level in the hole has not been maintained at the in situ water level. Suspect low N values should be noted on the field logs. If it is critical to have accurate N values below the water table, other methods can be employed, such as conducting a dynamic cone penetration test. This quick and easy test involves attaching a cone shaped tip to the end of the drill rods, and driving the tip into the ground similar to the SPT method, except that the borehole is not pre-augered. Cones may be driven 20 to 40 feet through a formation without augering. Blow counts are recorded for each foot (0.3 m) of advancement.

A variation of split barrel sampling involves the use of a longer barrel in conjunction with hollow stem augers. The sampling barrel is installed inside the auger with a swivel attachment to limit rotation of the barrel. After completion of a 5-foot auger penetration, the auger is left in place and the barrel retrieved from the borehole. The sampler should be handled and the sample retrieved in the same way as described above for SPT sampling. This method is quicker than SPT split spoon sampling and the sample is virtually undisturbed because the cutting shoe sits ahead of the auger. No SPT information is collected due to soil sample collection during auger run.

#### Thin-Walled Samplers (Shelby Tubes)

Thin-walled samplers are used to collect relatively undisturbed samples (as compared to split-spoon samples) of soft to stiff clayey soils. Shelby tubes are commonly used. The Shelby Tube has an outside diameter of 2 or 3 inches and is 3 feet long. These undisturbed samples are used for certain laboratory tests of structural properties (consolidation, hydraulic conductivity, shear strength) or other tests that might be influenced by sample disturbance. Procedures for conducting thin-walled tube sampling are provided in ASTM D1587, and are briefly described below.

- the soil deposit being sampled must be cohesive in nature, and relatively free of sand, gravel, and cobble materials, as contact with these materials will damage the sampler;
- clean out the borehole to the sampling elevation using whatever method is preferred that will ensure the material to be sampled is not disturbed. If groundwater is encountered, maintain the liquid level in the borehole at or above groundwater level during the sampling operation;
- bottom discharge bits are not permitted. Side discharge bits may be used, with caution. Jetting through an open-tube sampler to clean out the borehole to sampling elevation is not permitted. Remove loose material from the center of a casing or hollow-stem auger as carefully as possible to avoid disturbance of the material to be sampled;

- place the sample tube so that its bottom rests on the bottom of the hole. Advance the sampler into the formation without rotation by a continuous and relatively rapid motion; usually hydraulic pressure is applied to the top of the drill rods;
- determine the length of advance by the resistance and condition of the formation, but the length shall never exceed 5 to 10 diameters of the tube in sands and 10 to 15 diameters of the tube in clays;
- in no case should the length of advance be greater than the sample-tube length minus an allowance for the sampler head and a minimum of 3 inches for cuttings.
- the tube may be rotated to shear the bottom of the sample 2 to 3 minutes after pressing in, and prior to retrieval to ensure the sample does not slide out of the tube. Lift the weight of the rods off of the tube prior to rotating.
- withdraw the sampler from the formation as carefully as possible in order to minimize disturbance of the sample;
- package and transport the sample in accordance with Paragraph ix).

On occasion it may be required to extract the sample from the tube in the field.

- a sample extruder, which consists of a clamp arrangement to hold the tube and a hydraulic ram to push the sample through the tube, is usually mounted on the side of the rig. To prevent cross-contamination, be certain that the extruder is field cleaned between each sample;
- the sample is then extruded into a carrying tray; these are often made from a piece of 4-inch or 6-inch diameter PVC pipe cut lengthwise. Be certain that the carrying tray is field cleaned between each sample. The sample is carried to the work station to describe the sample, trim the potentially cross contaminated exterior, and place it in the appropriate container; and
- the Shelby tube may then be thoroughly field cleaned and decontaminated for reuse. Since they are thin-walled, the tubes are easily damaged, crimped, or otherwise distorted during handling or pushing. The Shelby Tube should be inspected before use and any which are significantly damaged should be rejected.

#### v) Borehole Completion

At the completion of the soil boring, once the soil/groundwater samples have been collected, the borehole annulus is then abandoned. Each boring will be surveyed to establish vertical/horizontal information; field ties (i.e., swing ties) will also be collected to document the boring location. Once completed, a stratigraphic log will be prepared for reporting purposes.

## **EQUIPMENT**

- Drilling Equipment

- Tape Measure

## 2.4 BOREHOLE ABANDONMENT/SEALING

### INTRODUCTION

The following procedure describes common techniques for the abandonment/sealing of overburden boreholes. Borehole completion may have been performed by hollow stem augering/split spoon sampling, direct push sampling device, solid stem augering or other soil sample collection techniques. The method of borehole abandonment selected for a program will be dependent on a number of factors such as: depth to groundwater, presence of contamination (and degree of contamination i.e., light or dense non-aqueous phase liquids - NAPL), confining layer presence and/or physical setting (i.e., open field/vacant land, vs. facility setting). The Work Plan guiding these activities (soil boring/boring closure) will dictate which method of borehole abandonment/sealing is required. The borehole abandonment/sealing techniques reviewed in the following consist of:

- soil cutting backfill;
- bentonite chip backfill; or
- cement/bentonite grout backfill using tremie techniques.

Boreholes need to be abandoned and sealed properly to prevent surface water entry to the groundwater regime, to eliminate any physical hazard, and to prevent/protect groundwater movement from one aquifer to another.

### PROCEDURES REFERENCED

- 2.2 Soil Borings

### BOREHOLE ABANDONMENT/SEALING PROCEDURE

#### A. Soil Cutting Backfill

Typically employed when working above groundwater table and at shallow depths.

- The final depth of borehole will be measured and recorded.
- Cuttings are dropped into borehole after augering/sample equipment is removed.
- Drill rod and/or probe rodding is used to compact/compress cuttings to allow return of all cuttings back into borehole.
- Mound final surface of cuttings above ground surface to allow settlements and promote surface water runoff away from boring.
- Borehole abandonment will be documented in field records/notes.

## B. Bentonite Chip Backfill

Typically employed when working above or just into the groundwater table

- Excess cuttings have been drummed for disposal or excess cuttings have been spread at ground surface.
- The depth of the borehole will be measured and recorded.
- Bentonite chips will be dropped into borehole as hollow stem augers are removed, or after the boring equipment has been removed from the borehole (solid stem auger, probing tools, split spoon samplers).
- The bentonite chip backfill will be extended to within 1 foot of ground surface, the final borehole space will be backfilled with native soil and mounded slightly to allow settlement and promote surface water runoff away from the boring. Alternatively, the borehole cuttings may be mixed with bentonite to complete the abandonment/sealing task.
- Borehole abandonment will be documented in field records/notes.

## C. Cement/Bentonite Grout Backfill

Typically employed when working below the groundwater table, or in an area where a confining layer exists and the potential for groundwater/NAPL movement along a preferential pathway (i.e., former borehole) must be eliminated.

- The final depth of borehole will be measured and recorded.
- The volume of grout required will be calculated from the above measurements.
- A grout mix of one bag (94 lbs.) of Portland Cement and three pounds of bentonite with approximately 7.5 gallons of clean water will be prepared.
- Using a tremie tube placed at the base of the borehole the grout will be pumped until observed at the required elevation. The tremie tube will be raised as the grout level rises (positive displacement technique).
- The bentonite/grout backfill will be extended to within 1 foot of ground surface, the final borehole space will be backfilled with native soil and mounded slightly to allow settlement and promote surface water runoff away from boring.
- Borehole abandonment will be documented, noting depth of borehole; volume of grout used and mix ratio.
- Groundwater displaced from the borehole may or may not required containment depending on borehole setting and/or water quality.

*NOTE: AT THE COMPLETION OF BOREHOLE ABANDONMENT/SEALING ACTIVITIES (REGARDLESS OF METHODOLOGY EMPLOYED) IT IS NECESSARY TO CHECK FOR SURFACE SETTLEMENT A FEW DAYS AFTER WORK COMPLETION TO DETERMINE IF THE BOREHOLE AREA REQUIRES "TOPPING OFF".*

### Restoration

The area around the borehole shall be restored as directed by the plant representative (e.g., asphalt, concrete, vegetation).

### Cleanup

The area around the borehole shall be completely cleaned up of any investigation related materials (litter, etc.).

### **EQUIPMENT/MATERIALS**

- Grout pump/mixing equipment
- Test Boring Report

## 3.1 WELL CONSTRUCTION MATERIALS

### INTRODUCTION

In environmental subsurface investigations, the information used to evaluate subsurface conditions often relies on the installation of appropriate groundwater monitoring wells. The application and use of the proper well construction materials to the specific well installation is crucial to obtaining representative and reliable groundwater samples.

The two general types of wells are groundwater monitoring wells and pumping (also referred to as recovery, extraction, or withdrawal) wells. The specific use of a groundwater well dictates the types of materials with which it is constructed.

This SOP outlines the general types and use of well construction materials and considerations involved in selecting appropriate materials for specific well installation applications. Installation of these materials is described in detail in the specific well-installation SOPs listed below.

### PROCEDURES REFERENCED

- 3.2 Overburden Monitoring Well Installation

### MATERIAL DESCRIPTIONS

#### A. Well Screen

The screen is the portion of the well that contains appropriately sized openings and allows groundwater to enter the well. The screen materials used in groundwater monitoring wells are crucial to ensuring the installation of an efficient, productive, and durable groundwater well.

The diameter of the well screen is generally dependent upon the application of the well. For monitoring wells used in groundwater level measurements and groundwater sampling, screen diameter will generally be 2.0-inch inner-diameter (I.D.) flush-threaded screen segments (piezometers are typically 1.0-inch inner diameter but may also be 2-inch). These screen segments are typically available in 10-foot lengths. Four-inch diameter or larger well screens are usually used for recovery or production well applications where larger diameters permit greater groundwater withdrawal rates. Larger diameter wells also allow a well to serve additional functions such as housing extraction oil recovery systems.

Screen material will be either thermoplastic Schedule 40 PVC (PolyVinylChloride) (ASTM D1785, ASTM D2665, ASTM F480) or Schedule 5 Type 316 stainless steel, depending primarily on the depth of the well and the groundwater quality (degree and nature of contamination). Shallower depths and generally low levels of contaminants in groundwater allow for PVC applications, whereas greater depths and severely degraded groundwater quality, or the presence of free-phase oils or solvents, may necessitate stainless steel due to its greater strength and resistance to chemical degradation. It should be noted that PVC and stainless steel are appropriate for the vast majority of environmental applications, and are generally accepted by regulatory agencies. Well materials other than PVC or stainless steel should be used only in certain instances, to be determined and approved by the Consultant Project Manager on a case-by-case basis.

Certain applications such as investigation of inorganic (metals) concentrations in groundwater, or the presence of low pH (acidic) conditions may preclude the use of stainless steel wells. Stainless steel, which contains molybdenum in addition to its iron content, may leach out metal compounds which could cause to misleading groundwater analysis results.

PVC may likewise leach out or degrade specific thermoplastic elements of its composition which may compromise the well integrity or groundwater analyses. PVC generally performs well in acidic groundwater conditions; however, it may degrade in the presence of certain organic compounds such as ketones, aldehydes or chlorinated compounds in high concentrations. Certain additives to the PVC may also affect groundwater quality.

Well screen slot sizes and well screen type will also be consistent for groundwater monitoring wells. Screen slot size is typically 0.010 inches; 0.020-inch slot size may be more appropriate for coarser formation materials or where the well may serve as a recovery well for free-phase oils. For monitoring applications, slot type should be either factory machine-slotted or continuous-wrap slotted. Perforated, bridge-slotted or louver-slotted well screens are generally not acceptable for most environmental applications and should be avoided.

Screen slot sizes may vary from these two sizes when used in production or recovery (pumping) well applications where the need to maximize groundwater withdrawal is essential. In such cases, screen slot sizes can be manufactured to exact specifications for a particular well based on particle size analysis results and formation transmissivity or permeability.

## **B. Well Riser Pipes and Casings**

Well riser pipe is a solid extension of the well that extends from the screen up to the surface. The riser pipe protects the well screen, prevents outside groundwater from

entering the well, and allows groundwater pumped from down in the open interval to be routed up through the well to the surface.

Well riser pipe should be of the same material and size as the well screen described above. In instances to be determined and approved by the project manager on a case-by-case basis only, differing materials may be approved for use in the same well (e.g. stainless steel well screen connected to PVC riser). Well risers should extend to the surface and should either be cut at grade in flush-mount completions or as an approximately 3-foot stickup to be covered with a steel protective casing.

Well riser pipe sections shall be flush-threaded and fitted with neoprene, rubber, or other appropriately constructed, durable o-rings to properly seal the threaded pipe joints. Glues or cements are not to be used in well construction.

In installations of bedrock monitoring wells, which have an open rock monitoring interval and a permanent well casing that extends from bedrock to the surface, the permanent casing (or casings in telescoping wells) shall be made of carbon steel, low-carbon steel ( $\geq 0.8\%$  carbon and  $\leq 0.8\%$  carbon, respectively), or PVC. The well casing should be a minimum of 4 inches in diameter (at least 4-inch diameter for the innermost casing).

#### C. Sand Packs

The filter pack, or sand pack, installed in a well replaces formation material immediately around a well with a more permeable material (sand). The sand pack separates the well screen from the formation, increases the hydraulic diameter of the well, and prevents fines (silt or clay) from entering or clogging the well screen.

Sand pack of an appropriate size shall be utilized based on the well screen slot size being used. Sand pack size should be chosen so that the majority of the sand (sand pack has inherent variation in its particle grain size distribution) is larger than the screen slot size while sized small enough to prevent deleterious amounts of formation fines from entering the well through the sand pack. Screen slot sizes of 0.010-inch and 0.020-inch typically use a sand pack such as Morie or U.S. Silica #1, #0, #00N, or equivalent.

Sand pack shall be washed silica sand with a silica content of at least 95%. Sands should meet one or more of the following requirements: NSF Standard 61, AWWA B-100, ANSI, or equivalent standards for uniformity and chemical inertness. In cases to be determined and approved by the project manager on a case-by-case basis only, differing sand pack materials may be approved for use in a well. Sand packs used for production and recovery wells with larger screen slot sizes will use larger-particle-sized sand packs of the same type and quality. The slot size and sand pack size for recovery wells should be chosen based on results of formation grain size distribution analysis.

#### D. Seals

Bentonite and grout seals are installed above the sand pack to isolate the monitoring interval and prevent groundwater from infiltrating into the well screen from other water-bearing zones. Seals also prevent migration of backfill or formation materials downward into the sand pack.

Bentonite is the generic name for a group of a naturally-occurring clay minerals (montmorillonites) that come in a variety of forms: pellets, chips, granulated, or powdered. This material is commercially available as “Wyoming Bentonite”. When hydrated it swells to many times its original volume and forms an ultra-low-permeability clay seal.

Bentonite chips or pellets are generally used to create a seal immediately above the sand pack. The chips/pellets are dropped inside the augers or well casing by hand down through the water column onto the top of the sand pack. Care must be taken to prevent “bridging” of the bentonite particles in the casing above the target zone. Measurements of the depth to the top of the seal must be obtained during installation of the seal to ensure its proper position and thickness. In the absence of significant water in a casing or borehole, potable water must be added to hydrate the bentonite. The bentonite seal will be allowed to set for a minimum of one-half hour, in order to hydrate properly, before additional seals (grout) are applied. Once the bentonite has set for one-half hour the grout seal may be placed, as described below.

In saline groundwater environments, such as where ocean water may infiltrate the monitoring interval, a zeolite-based seal material may be used, as saline conditions may hamper the performance of bentonite pellets.

Portland cement grout (grout) forms a concrete-like seal that can be more manageable than bentonite (e.g. able to be pumped through a water pump). Grout is generally placed on top of the hydrated bentonite seal to form a solid cement seal around the well riser up to the surface.

The grout mixture will consist of one 94-pound bag of Portland Cement and 3 to 5 pounds of powdered bentonite added per sack of cement. Two (2) pounds of calcium chloride may also be added (under certain conditions, e.g. very cold days) to accelerate the setting time of the grout, as well as to increase the dry strength of the grout. The grout will be thoroughly mixed with 6.5 gallons of potable water per sack of cement. Grout is generally placed using either the tremie or Halliburton grouting methods. These are described in the specific well installation SOPs.

#### E. Protective Casings and Surface Seals

Once the well screen, riser, and all seals have been placed to ground surface, the well riser must be protected. This includes protection from vehicles, damage, surface water

infiltration, and weather. This is typically accomplished using either a flush-mount roadbox or a stickup casing.

Flush-mount roadboxes are circular steel casing segments with a heavy-duty steel lid with locking bolts. These units are widely available and come in a number of diameters and lengths, depending on the well diameter. A stickup protective casing is generally a length of carbon or stainless steel pipe with a locking top.

For a typical 2-inch monitoring well, the roadbox should be at least 6 inches in diameter; a stickup casing should be at least 4 inches in diameter. A roadbox should be at least 12 inches in length (they are typically 16 to 18 inches long) and is installed flush with the ground surface. A stickup casing should be at least 5 to 6 feet long such that approximately 2.5-3 feet is below ground surface and 2.5-3 feet is protruding above grade. In wells where a permanent steel casing is installed (serves as the well riser pipe) and brought to the ground surface, it may be used as the protective casing provided it is equipped with a semi-permanent, metal, locking cap or cover that can be affixed to the steel casing.

Flush-mount installations should have at least the last 18-inches of the open borehole filled with coarse sand, placed up to ground surface to allow drainage of surface water infiltration down through and out of the roadbox. This also prevents infiltrating surface water from accumulating up over the top of the well riser and draining down into the well. This sand drain is not necessary in the locking-cap stickup casings.

Both roadbox and stick-up casings must be secured in the ground with concrete, which also serves as a surface seal.

In areas of high vehicle traffic activity, protective steel bollards should be installed. This is typically a vertically-oriented, concrete-filled, steel pipe (min. 4-in diameter) cemented at least 3 ft. into the ground, acting as a “guard rail” for the well casing and preventing it from being damaged by vehicles. Three bollards should be placed around a well to provide adequate protection.

## **EQUIPMENT**

- Drilling equipment
- Well screen and riser materials
- Sand pack
- Bentonite pellets/chips
- Powdered bentonite

- Portland cement

## **3.2 PROCEDURES FOR OVERBURDEN MONITORING WELL INSTALLATION**

### **INTRODUCTION**

This procedure presents the drilling, installation, and completion of overburden monitoring wells. The design and installation of monitoring wells involves the drilling of boreholes into various types of geologic formations. Designing and installing monitoring wells may require different drilling methods and installation in the overburden. However, due to specific site and monitoring requirements, the procedure may be revised as necessary to reflect these site-specific needs. Prior planning is required for the selection of the appropriate drilling method and selection of well materials.

### **PROCEDURES REFERENCED**

- 2.5 Soil Classification
- 3.4 Well Development
- 5.1 Soil Sampling
- 7.0 Equipment Decontamination

### **DRILLING PROCEDURES**

- Drilling and sampling equipment arriving on site will be decontaminated prior to drilling in accordance with the Decontamination and Waste Disposal Procedure.
- Drilling generated waste materials will be disposed according to the Decontamination and Waste Disposal Procedure.
- Record construction and geologic information on the attached subsurface boring log.
- The depth to the target interval may be determined from an existing adjacent monitoring well/boring or from information obtained from split spoon sampling

of the borehole. The criteria for determining the target interval to be monitored will be presented in the Project Work Plan. An 8-inch diameter borehole will be advanced to the target interval using a minimum 4¼-inch inside diameter (I.D.) hollow-stem auger.

- In the instances where the borehole is advanced deeper than the target interval, a bentonite pellet seal will be installed to bring the bottom of the boring to within 6 inches of the target interval. Six inches of filter sand will then be placed above the bentonite seal prior to further well installation.
- In some areas where the water table is known to be at or near the top of bedrock, the base of the overburden well will be installed at the top of bedrock.
- Continuous split-spoon samples may be collected, if required by applicable project Work Plan. (see Subsurface Soil Sampling Procedure). If collected, soil samples will be classified in accordance with the Soil Classification Procedure.

## **WELL CONSTRUCTION**

- The well construction procedures presented below are the recommended standards. However, due to variations in subsurface conditions, changes in these well construction standards may be necessary in order to facilitate the installation of the protective casing.
- Overburden wells will be constructed of either 2-inch Schedule 40 Flush-threaded Virgin PVC or type 316 Stainless Steel. Type of well material to use will be dependent upon known subsurface conditions. Wells constructed of PVC are preferable; however in situations where sufficient levels of chlorinated solvents are present to affect the PVC well integrity, stainless steel will be the material of choice. Wells of mixed construction materials are not acceptable. The well screen will consist of machine slot or continuous wrap PVC or Stainless Steel with screen slot size appropriate for the type of subsurface material. It is anticipated that PVC will be used at the site.
- The bottom of the well screen will be placed to the bottom of the borehole. Ideally, the top of the well screen should be greater than 4 feet below grade. As the augers are slowly removed, clean washed silica sand filter pack will be placed in the annular space around the well screen and casing from the base of the screen to at least 2 feet above the screen.

- In wells that exhibit a water table elevation above the sand pack, a minimum of 2-foot thick layer of bentonite pellets will be placed above the sand pack. The seal will be hydrated and allowed to set for approximately 30 minutes.
- Cement/bentonite grout will be placed from the top of the bentonite seal to a point 5 feet below existing ground surface where conditions allow. The grout will be prepared in the ratio of one bag (94 pounds) of Type I or Type II Portland Cement to 3 to 5 pounds of bentonite powder mixed with approximately 7 gallons of potable water.
- Accurate measurements of the material depths will be made by sounding the annulus during installation. The volume of materials needed will be calculated and compared to the actual volume used. Material depths will be recorded on the well installation report log (attached).
- The well casing will be secured with a vented lockable cap. If the well is located in a high traffic area, the casing will be protected by 9-inch flush-mounted roadway box set in a concrete seal. Alternatively, in low traffic areas, the well casing may be cut above grade and completed with 4 or 6-inch diameter steel protective casing with approximately 3 feet of stick up, set in a concrete surface seal.
- For flush-mounted wells, a 9-inch diameter, water-tight protector will be installed complete with a sand drain. A lockable gripper plug will top the PVC casing.
- After installation, the monitoring well will be labeled with the well identification and a reference point for water level and depth measurements will be notched into the well casing. The well will be allowed to sit for at least 24 hours prior to well development, and for one week between development and groundwater sampling.

### **3.3 WELL DECOMMISSIONING PROCEDURES**

#### **INTRODUCTION**

This procedure is for the decommissioning/abandonment of groundwater monitoring wells that have been installed in overburden, top of bedrock, or deep bedrock formations. Well decommissioning refers to the procedure used to properly abandon or remove the monitoring well from the formation while taking the proper precautions to help eliminate cross-contamination.

The methods for properly abandoning monitoring wells are either by leaving the well materials in place and pressure grouting with a cement/bentonite slurry directly into the well or by over-drilling with augers, removing the well material and back filling with a cement bentonite slurry.

#### **PROCEDURES REFERENCED**

- 3.2 Procedures for Overburden Well Installation
- 7.0 Equipment Decontamination

## WELL DECOMMISSIONING PROCEDURES

### 1. Pressure Grouting

- The borehole log from the monitoring well needs to be obtained to determine the well construction in order to prepare the proper materials and calculate the quantity of cement/bentonite slurry that will be required.
- The cement pad and the well protector around the monitoring pad needs to be removed and the immediate area around the monitoring well dug out. The riser pipe is to be cut off approximately one to two-feet below ground surface.
- A tremie pipe will be placed into the well completely to the bottom. A cement/bentonite slurry will then be pressure grouted in to the monitoring well backfilling completely to the surface. The grout will be prepared in the ratio of one bag (94 pounds) of Type I or Type II Portland Cement to 3 to 5 pounds of bentonite powder mixed with approximately 7 gallons of potable water. The grout will be allowed to sit for approximately one hour to allow any settlement of the cement/bentonite slurry and then augment if needed.

### 2. Overdrilling

- Based on the diameter of the monitoring well, this information can be obtained from the well completion diagram, the proper sized augers need to be specified.
- The cement pad and the well protector around the monitoring pad needs to be removed and the immediate area around the monitoring well dug out. The riser pipe is to be cut off approximately one to two-feet below ground surface.
- The augers are then placed over the riser pipe of the monitoring well and then drilling commences. The drilling continues until the final depth to which the monitoring well was installed is reached. The well materials are then removed (pulled) from the augers.
- A Cement/bentonite grout will be placed from the bottom of the borehole to the top of the augers. As each flight of augers is removed from the ground, the cement/bentonite grout will continue to be placed in the augers, to the top. This will continue until all the augers have been removed from the borehole. The grout will be prepared in the ratio of one bag (94 pounds) of Type I or Type II Portland Cement to 3 to 5 pounds of bentonite powder mixed with approximately 7 gallons of potable water.
- Documentation/Notification requirements include modification of the well log to reflect closure and if necessary notification to the appropriate regulatory agency.

## **WASTE DISPOSAL**

- All material generated during well decommissioning procedures will be collected and contained on site in roll-off boxes or 55-gallon drums for future analysis and appropriate disposal.
- Personal protective equipment, such as gloves, disposable clothing, and other disposable equipment, resulting from personnel cleaning procedures and from soil sampling and handling activities, will be placed in plastic bags. These bags will be transferred into appropriately labeled 55-gallon drums or a covered roll-off box for appropriate disposal.

## **EQUIPMENT**

### **3.4 WELL DEVELOPMENT PROCEDURES**

#### **INTRODUCTION**

This procedure is for the development of groundwater monitoring wells that have been installed in overburden, top of bedrock, or deep bedrock formations. Before a newly constructed well can be used for water-quality sampling, measuring water levels, or aquifer testing, it must be developed. Well development refers to the procedure used to clear the well and formation around the screen of fine-grained materials (sands, silts, and clays) produced during drilling or naturally occurring in the formation.

Well development is completed to remove fine-grained materials from the well but in such a manner as to not introduce fines from the formation into the sand pack. Well development continues until the well responds to water level changes in the formation (i.e., a good hydraulic connection is established between the well and formation) and the well produces clear, sediment-free water to the extent practical.

#### **PROCEDURES REFERENCED**

- 3.2 Procedures for Monitoring Well Installation

#### **WELL DEVELOPMENT PROCEDURES**

- The well development procedures presented below are the recommended standards. However, due to variations in conditions, changes in these well development standards may be necessary in order to facilitate the successful completion of developing the monitoring well. Well development can be accomplished by using in-place pumps or using manual equipment; either peristaltic, bladder, or other appropriate pumps depending on well depth.
- Don appropriate safety equipment.
- Attach appropriate pump and lower tubing into well.
- Turn on pump. If well runs dry, shut off pump and allow to recover.
- Surging will be performed by raising and lowering the pump in the well to open and close the check valve in the pump several times to pull fine-grained material from the well. Collect the groundwater sample in a glass jar to determine relative

turbidity, and measure and record the temperature, pH, and specific electrical conductance.

- The fourth and fifth steps will be repeated until groundwater is relatively silt-free; no further change is noted; and the temperature, pH, and specific conductance readings have stabilized to within 10% or 10 well volumes and 5 times the volume of water used to complete the well have been removed.
- The developing equipment will be raised two feet and then Steps 4 and 5 will be repeated.
- Step 6 will be repeated until entire well screen has been developed.

#### **WASTE DISPOSAL**

- All water generated during cleaning and development procedures will be collected and contained on site in 55-gallon drums for future analysis and appropriate disposal.
- Personal protective equipment, such as gloves, disposable clothing, and other disposable equipment, resulting from personnel cleaning procedures and from soil sampling and handling activities, will be placed in plastic bags. These bags will be transferred into appropriately labeled 55-gallon drums or a covered roll-off box for appropriate disposal.

## **EQUIPMENT**

- Appropriate health and safety equipment
- Knife
- Power source (generator)
- Field book
- Well Development Form
- Well keys
- Graduated pails
- Pump and tubing
- Cleaning supplies (including non-phosphate soap, buckets, brushes, laboratory-supplied distilled/deionized water, tap water, cleaning solvent, aluminum foil, plastic sheeting, etc.)
- Water level meter
- pH/temperature/conductivity meter
- Clear glass jars (e.g., drillers' jars)

## **5.1 SOIL SAMPLE COLLECTION FOR LABORATORY ANALYSIS**

### **INTRODUCTION**

The following procedure describes typical soil sample collection methods for submission of samples to a laboratory for chemical analysis. Two sample situations are presented: soil sampling from surficial soils and soil sampling from sub-surface samplers such as a split-spoon sampler or a direct push sampler.

Soil sampling procedures may vary from project to project due to different parameters of concern, different guidance provided by the state/province where the site is located, or the specific objectives for the project. Therefore, it is essential that the sampling team members carefully review the Non-Radiological Site Characterization Work Plan requirements and the rationale behind the program. The primary goal of soil sampling is to collect representative samples for examination and chemical analysis (if required).

#### Grab Versus Composite Samples

A grab sample is collected to identify and quantify compounds at a specific location or interval. The sample is comprised of no more than the minimum amount of soil necessary to make up the volume of sample dictated by the required sample analyses.

### **PROCEDURES REFERENCED**

- 7.0 Equipment Decontamination

## **SAMPLE COLLECTION**

### **1.0 Surficial Soil Sample Collection**

#### **1.1 Sample Strategy -Random, Biased, and Grid-Based Sampling**

Unless there is a strong indication of contaminant presence, such as staining, then soil sample locations may be randomly selected from several areas within the site.

If any areas show evidence of contamination, such as staining or vegetative stress, biased samples will be collected from each area to characterize the contamination present in each area. Background and control samples are also biased, since they are collected in locations typical of non-Site-impacted conditions.

When soil sampling investigations involve large areas, a grid-based soil sampling program is used. There is no single grid size that is appropriate for all sites. Common grid sizes are developed on 50-foot and 100-foot centers. It is acceptable to integrate several different grid sizes in a single investigation.

For surficial soil sampling programs, it is also important to consider the presence of structures and drainage pathways that might affect contaminant migration. It is sometimes desirable to select sampling locations in low lying areas which are capable of retaining some surface water flow since these areas could provide samples which are representative of historic site conditions (worst-case scenario if surface water flow was a concern).

#### **1.2 Sample Interval**

Surficial soils are generally considered to be soil between ground surface and 6 to 12 inches below ground surface. However, for risk assessment purposes, regulatory authorities often consider soil from ground surface to 2 feet below ground surface to be surficial soil. The exact interval to be considered as surficial soil is often a matter of discussion with the regulatory authorities that review the RFI Work Plan. The sample interval is important to the manner in which the data are ultimately interpreted. Another important factor is the type of soil. If there are different types of soil present at the site, this may have a bearing on the sample interval. For example, it may be important to separately sample a layer of material with high organic carbon content that overlies a layer of fine-grained soil.

#### **1.3 Surface Sampling Procedure**

Soil sampling techniques are dependent upon the sample interval of interest, the type of soil material to be sampled, and the requirements for handling the sample after retrieval.

The most common method for collection of surficial soil samples involves the use of a stainless steel trowel. Soil samples may also be collected with spoons and push tubes. The sampling equipment is cleaned between sample locations. A typical surficial soil sampling protocol is outlined below:

- Surficial soil samples will be collected using a pre-cleaned stainless steel trowel or other appropriate tool. Each sample will consist of soil from the surface to the depth specified within the Work Plan;
- A new pair of disposable gloves will be used at each sample location;
- Any surficial debris (i.e., grass cover, gravel) should be removed from the area where the sample is to be collected using a separate pre-cleaned device. Gravel presents difficulties for the laboratory in terms of sample preparation and is typically not representative of contaminant concentrations in nearby soil.
- A pre-cleaned sampling tool will be used to remove the sample from the layer of exposed soil.
- When only one sample container is required, the collected soil will be placed directly into the clean, pre-labeled sample jar. When more than one sample container requires filling or samples will be split for duplicate analyses; the soils will first be homogenized in a pre-cleaned stainless steel bowl; and then placed into the respective sample containers. It is important that soil samples be mixed as thoroughly as possible to ensure that the sample is as representative as possible of the sample interval. When round bowls are used for sample mixing, mixing is achieved by stirring the material in a circular motion and occasionally turning the material over. Soil samples collected for volatile organic compounds analyses shall not be mixed.
- Samples will be placed on ice or cooler packs in laboratory supplied shipping coolers after collection.

Exception is noted for the collection of volatile organic compounds (VOC's) which require special sample collection methods. VOC's are collected directly into a sample vial (triplicate volume typically required) without headspace, or collected using an EnCore Sampler™ (triplicate samples collected per manufacturers instructions). Samples for VOC's are typically collected first, without homogenization or extra handling to limit the loss of volatile constituents.

The VOC sample collection methodology will be identified in the Work Plan, which will dictate the sample method. The methodology for VOC sampling varies from area to area, so carefull review of this issue in advance of the field efforts is required.

## 2.0 Sub-Surface Sample Collection

Sub-surface soil sample collection is typically performed with the help of a drill unit, direct-push probing unit, or hand-driven/held samplers. Typically a boring is advanced incrementally to permit intermittent or continuous sampling to the required depth of chemical sample collection; or alternatively sampling may be initiated if certain conditions are observed (i.e. chemical presence or volatile presence identified from monitoring). Sample collection criteria and locations, are normally stipulated by the Work Plan.

Any drilling procedure that provides a suitably clean and stable hole before insertion of the sampler and assures that the penetration test or other sampling technique is performed on essentially undisturbed soil is acceptable. The drilling method is to be selected based on the subsurface conditions. Each of the following procedures have proven to be acceptable for specific subsurface conditions:

- Conventional drilling with continuous flight hollow-stem auger method (with inside diameter between 2.2 and 6.5 inches) using split spoon samplers (Standard Penetration Test – SPT) or Shelby tube samplers; or
- direct - push samplers, advanced using a percussion/vibratory hammer ( Geoprobe <sup>TM</sup> or equivalent); or
- hand – held/driven split spoon sampling equipment or portable hammer and split spoon sampling equipment ( final depth will be limited).

Several drilling methods are not acceptable. These include: jetting through an open tube sampler and then sampling when the desired depth is reached; use of continuous flight solid auger equipment below the groundwater table in non-cohesive soils; casing driven below the sampling depth prior to sampling; and advancing a borehole with bottom discharge bits.

The following subsections describe the specific methods for completing split spoon sampling, shelly tube sampling, and direct-push sampling. Section 2.4 describes the soil sampling procedure for chemical analysis, once a soil core is recovered from any of the above sample collection devices.

### 2.1 Split – Spoon Sampling Method

This method is used to obtain representative samples of subsurface soil materials for sample collection. The test methods described below must be followed to ensure that the soils captured in the split-spoon or shelly tube are relatively undisturbed/representative of the desired soil interval and obtain accurate Standard Penetration Test (SPT) values. The SPT values reflect the sub-surface soils density and is typically measured when performing geo-technical work or environmental borings. This information although not

directly relevant to the collection of chemical samples, is collected because it is beneficial in terms of stratigraphy interpretation and understanding the conditions below grade.

The split barrel sampler, or split spoon, consists of an 18- or 24-inch long, 2-inch outside diameter tube, which comes apart length wise into two halves. Larger spoons are available for use when a larger sample volume is required (4-inch diameter spoons).

Once the borehole is advanced, by an appropriate method (e.g. hollow stem augers), to the target depth and the borehole cleaned of cuttings, representative soil samples are collected in the following manner:

- the split-spoon sampler should be inspected to ensure it is properly cleaned and decontaminated. The driving shoe (tip) should be relatively sharp and free of severe dents and distortions;
- the cleaned split-spoon sampler is attached to the drill rods and lowered into the borehole. Do not allow the sampler to drop onto the soil;
- after the sampler has been lowered to the bottom of the hole, it is given a single blow to seat it and make sure that it is in undisturbed soil. If there still appear to be excessive cuttings in the bottom of the borehole, remove the sampler from the borehole and remove the cuttings; and
- mark the drill rods in three or four successive 6-inch (0.15 m) increments, depending on sampler length, so that the advance of the sampler under the impact of the hammer can be easily observed for each 6-inch (0.15 m) increment.

The sampler is then driven continuously for either 18 or 24 inches (0.45 or 0.60 m) by use of a 140-pound (63.5 kg) hammer. The hammer may be lifted and dropped by either the cathead and rope method, or by using a trip, automatic, or semi-automatic drop system.

The hammer should free-fall a distance of 30 inches ( $\pm 1$  inches) (760 mm,  $\pm 25$  mm) per blow. Measure the drop at least daily to ensure that the drop is correct. To ensure a free-falling hammer, no more than 2 1/4 turns of the rope may be wound around the cathead (see ASTM D1586-84). The number of blows applied in each 6-inch (0.15 m) increment is counted until one of the following occurs:

- a total of 50 blows have been applied during any one of the 6-inch (0.15 m) increments described above;
- a total of 100 blows have been applied;
- there is no advancement of the sampler during the application of ten successive blows of the hammer (i.e., the spoon is "bouncing" on a stone or bedrock); or
- the sampler has advanced the complete 18 or 24 inches (0.45 or 0.60 m) without the limiting blow counts occurring as described above.

In some cases where the limiting number of blow counts has been exceeded, the field supervisor may direct the driller to attempt to drive the sampler more if collection of a greater sample length is essential.

On the field form, record the number of blows required to drive each 6-inch (0.15 m) increment of penetration. The first 6 inches is considered to be a seating drive. The sum of the number of blows required for the second and third 6 inches (0.15 m) of penetration is termed the "standard penetration resistance" or the "N-value".

*Note: If the borehole has sloughed and there is caved material in the bottom, the split spoon may push through this under its own weight, but now the spoon is partially "pre-filled". When the spoon is driven the 18 or 24 inches representing its supposedly empty length, the spoon fills completely before the end of the drive interval. Two problems arise:*

- 1. the top part of the sample is not representative of the in-place soil at that depth; and*
- 2. the SPT value will be artificially higher toward the bottom of the drive interval since the spoon was packed full. These conditions should be noted on the field log.*

The sampler is then removed from the borehole and unthreaded from the drill rods. The open shoe (cutting end) and head of the sampler are partially unthreaded by the drill crew and the sampler is transferred to the field supervisors work surface.

The open shoe and head are removed by hand, and the sampler is tapped so that the spoon separates.

Measure and record the length of sample recovered making sure to discount any sloughed material that is present on top of the sample core.

Caution must be used when conducting SPT sampling below the groundwater table, particularly in sand or silt soils. These soils tend to heave or "blow back" up the borehole due to the difference in hydraulic pressures between the inside of the HSA and the undisturbed soil. To equalize the hydraulic pressure, the inside of the HSA must be filled with water. The drilling fluid level within the boring or hollow-stem augers needs to be maintained at or above the in-situ groundwater level at all times during drilling, removal of drill rods, and sampling. Since heave or blow back is not always obvious to the driller, it is essential that the water level in the borehole always be maintained at or above the groundwater level.

Section 2.4 describes the soil sampling procedure for chemical analysis, once a soil core is recovered from a split spoon sampler.

## 2.2 Thin-Walled (Shelby Tubes) Sample Method

Thin-walled samplers are used to collect relatively undisturbed samples (as compared to split-spoon samples) of soft to stiff clayey soils. Shelby tubes are commonly used. The

shelby tube has an outside diameter of 2 or 3 inches and is 3 feet long. These undisturbed samples are used for certain laboratory tests of structural properties (consolidation, hydraulic conductivity, shear strength) or other tests (such as collection of soils for chemical analysis) that might be influenced by sample disturbance. Procedures for conducting thin-walled tube sampling are provided in ASTM D1587-94, and are briefly described below.

- the soil deposit being sampled must be cohesive in nature, and relatively free of sand, gravel, and cobble materials, as contact with these materials will damage the sampler;
- clean out the borehole to the sampling elevation using whatever method is preferred that will ensure the material to be sampled is not disturbed. If groundwater is encountered, maintain the liquid level in the borehole at or above groundwater level during the sampling operation;
- bottom discharge bits are not permitted. Side discharge bits may be used, with caution. Jetting through an open-tube sampler to clean out the borehole to sampling elevation is not permitted. Remove loose material from the center of a casing or hollow-stem auger as carefully as possible to avoid disturbance of the material to be sampled;
- place the sample tube so that its bottom rests on the bottom of the hole. Advance the sampler into the formation without rotation by a continuous and relatively rapid motion; usually hydraulic pressure is applied to the top of the drill rods;
- determine the length of advance by the resistance and condition of the formation, but the length shall never exceed 5 to 10 diameters of the tube in sands and 10 to 15 diameters of the tube in clays;
- in no case should the length of advance be greater than the sample-tube length minus an allowance for the sampler head and a minimum of 3 inches for cuttings.
- the tube may be rotated to shear the bottom of the sample 2 to 3 minutes after pressing in, and prior to retrieval to ensure the sample does not slide out of the tube. Lift the weight of the rods off of the tube prior to rotating.
- withdraw the sampler from the formation as carefully as possible in order to minimize disturbance of the sample.

On occasion it may be required that extraction of the sample from the tube be conducted in the field for chemical sample collection. The following procedure should be followed.

- a sample extruder, which consists of a clamp arrangement to hold the tube and a hydraulic ram to push the sample through the tube, is usually mounted on the side of

the rig. To prevent cross-contamination, be certain that the extruder is field cleaned between each sample;

- the sample is then extruded into a carrying tray; these are often made from a piece of 4-inch or 6-inch diameter PVC pipe cut lengthwise. Be certain that the carrying tray is field cleaned between each sample. The sample is carried to the workstation to describe the sample, trim the potentially cross-contaminated exterior, and select the area for sample collection (see section 2.4 collection procedure).
- the shelby tube may then be thoroughly field cleaned and decontaminated for reuse. Since they are thin-walled, the tubes are easily damaged, crimped, or otherwise distorted during handling or pushing. The shelby tube should be inspected before use and any which are significantly damaged should be rejected.

Section 2.4 describes the soil sampling procedure for chemical analysis, once a soil core is recovered from a shelby tube sampler.

### 2.3 Direct- Push Sample Method

The operation of the direct-push samplers (i.e. Macro-Core <sup>TM</sup> Soil Sampler or equivalent) consists of “pushing and/or vibrating” the sampler into the subsurface using a direct-push unit (i.e. Geoprobe <sup>TM</sup> soil probing machine or equivalent). The sampler is typically a hollow tube with a threaded drive head, and threaded cutting shoe; provided with an internal sleeve (i.e. liner) that the soil sample is captured in.

Once driven to the required depth, the sampler body/soil liner and soil core is removed from the borehole for inspection and sample collection. Once above grade the sampler is opened by the probe operator and the liner removed and cut open (opened with a dual blade cutting tool), to expose the soil for inspection and sampling.

The sampler body and ends are decontaminated and a new liner is inserted and the sampler reassembled for collection of the next interval. The clean sampler is then advanced back down the same hole to collect the next soil sample. The Macro-Core <sup>TM</sup> sampler can be used in either the open-tube or closed-point sampling mode. The open-tube is the most commonly used method, typically employed in stable soil conditions when the borehole does not collapse. The closed-point system seals the cutting shoe opening until the sampler is at the next sample interval, this prevents collapsed soil from entering the sampler as it is advanced back down the hole. Once at the sample depth, the closed-point is unthreaded and released from the cutting shoe area, such that it rides on top of the soil core as it is being driven into the next interval.

Section 2.4 describes the soil sampling procedure for chemical analysis, once a soil core is recovered from a direct-push sampler.

## 2.4 Soil Core Chemical Sample Collection Procedure

The following describes the collection of soil samples for chemical analysis from a split spoon soil core, shelly tube soil core, or direct-push sample core.

- record soil core recovery and soil stratigraphy data;
- discard upper and lower ends of sample core (3 inches  $\pm$ );
- if clayey soils are present use a pre-cleaned stainless steel knife to cut the remaining core longitudinally, alternatively if sandy soils are present, use a clean stainless steel spoon to scrape away the soil surface;
- screen the exposed soil surface with a PID to monitor for the presence of volatile organics;
- with a sample knife or spoon, remove soil from the center portion of the core and place in the sample jar (when only one aliquot is required), or
- when more than one aliquot is required place soils in a pre-cleaned stainless steel bowl for homogenization;
- do not sample large stones and natural vegetative debris;
- homogenize the soil and place directly into the sample jars
- properly label sample container; and
- place collected samples on ice or cooler packs in laboratory supplied shipping coolers.

When only one sample container is required, the collected soil will be placed directly into the clean, pre-labeled sample jar. When more than one sample container requires filling or samples will be split for duplicate analyses; the soils will first be homogenized in a pre-cleaned stainless steel bowl; and then placed into the respective sample containers. It is important that soil samples be mixed as thoroughly as possible to ensure that the sample is as representative as possible of the sample interval. When round bowls are used for sample mixing, mixing is achieved by stirring the material in a circular motion and occasionally turning the material over. Soil samples collected for volatile organic compounds analyses shall not be mixed.

Exception is noted for the collection of volatile organic compounds (VOC's) which require special sample collection methods. VOC's are collected directly into a sample vial (triplicate volume typically required) without headspace, or collected in triplicate using an EnCore Sampler<sup>TM</sup> (triplicate samples collected per manufacturers instructions). Samples for VOC's are typically collected first, without homogenization or extra handling to limit the loss of volatile constituents.

The VOC sample collection methodology will be identified in the Work Plan, which will dictate the sample method. The methodology for VOC sampling varies from area to area, so careful review of this issue in advance of the field efforts is required.

## **FIELD NOTES**

All conditions at the time of sample collection should be properly documented in the field log book. This should include a thorough description of the collection method, sample characteristics, including grain size, color, and general appearance, as well as date/time of sampling and labeling information. The location of the sampling point should be described in a sketch and three measurements (swing ties) should be taken to adjacent permanent structures so that the sample location can be readily identified in the field at a future date if necessary. It is often advisable to have a licensed land surveyor accurately survey the locations.

## **DECONTAMINATION**

In all sampling scenarios measures to prevent cross-contamination must be employed. The sampling device selected must be constructed of an inert material with smooth surfaces that can be readily cleaned.

Heavy equipment used for test pit operations must also be cleaned between each location when collecting samples for chemical analysis.

## **EQUIPMENT**

- Drilling equipment and soil sampling tools
- Decontamination fluids and rinse water
- Subsurface Boring Log
- Tape Measure
- Water Level Probe
- Appropriate sampling containers

## 5.2 GROUNDWATER SAMPLE COLLECTION FOR LABORATORY ANALYSIS

### INTRODUCTION

This procedure is for the collection of groundwater samples for laboratory analysis.

The following describes two techniques for groundwater sampling: "Low Stress/Low Flow Methods" and "Typical Sample Methods."

"Low Stress/Low Flow" methods will be employed when it is critical to collect groundwater samples where sediment/colloid presence is significant, particularly in fine-grained formations. Analyses typically sensitive to turbidity/sediment issues are Polychlorinated biphenyls (PCBs), Semi-volatile compounds (SVOCs) and metals.

The "Typical Sample Methods" will be employed where the collection of parameters less sensitive to turbidity/sediment issues are being collected (volatile organics - VOCs, and general chemistry).

*NOTE: If Non-aqueous phase liquids (NAPL) (light or dense) are detected in a monitoring well, groundwater sample collection will not be conducted and the Project Manager must be contacted to determine a course of action.*

### PROCEDURES REFERENCED

- 7.0 Equipment Decontamination

### PREPARATORY REQUIREMENTS

- Verify well identification and location using borehole log details and location layout figures. Note the condition of the well and inform the Project Coordinator of any necessary repair work required.
- Prior to opening the well cap, measure the breathing space above the well casing with a PID to establish baseline levels. Repeat this measurement once the well cap is opened. If either of these measurements exceeds the air quality criteria in the health and safety plan, field personnel should adjust their PPE accordingly.
- Prior to commencing the groundwater purging/sampling tasks, a water level must be obtained to determine the well volume for hydraulic purposes. In some settings it may be

necessary to allow the water level time to equilibrate. This condition exists if a watertight seal exists at the well cap and the water level has fluctuated above the top of screen; creating a vacuum or pressurized area in this air space. Three water level checks will verify static water level conditions or changing conditions.

- Calculate the water volume in the well. Typically overburden well volumes consider only the quantity of water standing in the well screen and riser; bedrock well volumes are calculated on the quantity of water within the open corehole and within the overburden casing.
- Estimate natural groundwater flow rate into well to determine the approximate pumping rate for purging/sampling activities.

#### **WELL PURGING AND STABILIZATION MONITORING (LOW STRESS/LOW FLOW METHOD)**

- The preferred method for groundwater sampling will be the low stress/low flow method described below.
- Bladder pumps/submersible variable rate pumps (i.e., Grundfos™ Rediflo or equivalent) are typically employed.
- Slowly lower the pump, safety cable, tubing and electrical lines into the well to the depth specified by the project requirements. The pump intake must be at the mid-point of the well screen to prevent disturbance and resuspension of any sediment in the screen base.
- Before starting the pump, measure the water level again with the pump in the well leaving the water level measuring device in the well when completed.
- Purge the well at 100 to a maximum of 500 milliliters per minute (ml/min). During purging, the water level should be monitored approximately every 5 minutes, or as appropriate. A steady flow rate should be maintained that results in drawdown of 0.3 feet or less. The rate of pumping should not exceed the natural flow rate conditions of the well being sampled. Care should be taken to maintain pump suction and to avoid entrainment of air in the tubing. Record adjustments made to the pumping rates and water levels immediately after each adjustment.
- During the purging of the well, monitor and record the field indicator parameters (pH, temperature, conductivity, oxidation-reduction (redox) reaction potential (ORP), dissolved oxygen (DO), and turbidity) approximately every five minutes. Stabilization is considered to be achieved when the final groundwater flow rate is achieved, and three consecutive readings for each parameters are within the following limits:
  - pH  $\pm 0.1$  pH units of the average value of the three readings;
  - temperature  $\pm 3$  percent of the average value of the three readings;
  - conductivity  $\pm 0.005$  milliSiemen per centimeter (mS/cm) of the average value of the three readings for conductivity  $< 1$  mS/cm and  $\pm 0.01$  mS/cm of the average value of the three readings for conductivity  $> 1$  mS/cm;

- ORP  $\pm 10$  millivolts (mV) of the average value of the three readings;
  - DO  $\pm 10$  percent of the average value of the three readings; and
  - turbidity  $\pm 10$  percent of the average value of the three readings, or a final value of less than 5 nephelometric turbidity units (NTU).
- Should stabilization not be achieved for all field parameters, purging is continued until a maximum of 20 well screen volumes have been purged from the well. Since low-flow purging (LFP) likely will not draw groundwater from a significant distance above or below the pump intake, the screen volume is based upon a 5-foot (1.4 m) screen length. After purging 20 well screen volumes, purging is continued if the purge water remains visually turbid and appears to be clearing, or if stabilization parameters are varying slightly outside of the stabilization criteria listed above and appear to be approaching stabilization.
  - If low-turbidity samples are critical to the project goals, purging will be extended until turbidity has been reduced to 5 NTU or less.
  - The pump must not be removed from the well between purging and sampling.

#### **WELL PURGING AND STABILIZATION MONITORING (TYPICAL METHOD)**

- Typically peristaltic pumps or bladder pumps or submersible pumps are preferred. In most cases bailer use is not desirable.
- Pump placement is typically performed at the mid-point of the screen.
- Purge the well until three consecutive well volume measurements of temperature and specific conductivity are approximately plus or minus 10 percent and if the pH values are within 1 pH unit of the last three value averages, and the groundwater turbidity values are less than 5 NTU. If stabilization has not occurred within the first five well volumes removed, continue purging and monitoring until eight well volumes have been pumped.
- Groundwater turbidity may be evaluated by a visual examination for sediment/silt presence or use of a nephelometer. Work Plan specific goals may exist for turbidity values that may require extending the purging, or require an alternate pumping system.
- Monitoring well purging is accomplished by using in-place pumps or by a peristaltic, bladder or other appropriate pump, depending on the well depth. The pump/hose assembly or bailer used for purging should be lowered into the top of the standing water column and not deep into the column. Typically pump placement at the mid-point of the screen is adequate.

## **SAMPLING TECHNIQUES**

- If an alternate pump is utilized, the first pump discharge volumes should be discarded to allow the equipment a period of acclimation to the groundwater.
- Samples are typically collected directly from the pump with the groundwater being discharged directly into the appropriate sample container. Avoid handling the interior of the bottle or bottle cap and don new gloves for each well sampled to avoid contamination of the sample.
- Order of sample collection:
  - Volatile organic compounds
  - Semi-volatile organic compounds
  - Total organic carbon (TOC)
  - Total organic halogens (TOX)
  - Extractable organics
  - Total metals
  - Dissolved metals
  - Phenols
  - Cyanide
  - Sulfate and chloride
  - Nitrate and ammonia
  - Radionuclides
- For low stress/low flow sampling, samples should be collected at a flow rate between 100 and 500 mL/min and such that drawdown of the water level within the well does not exceed the maximum allowable drawdown of 0.3 feet.
- The pumping rate used to collect a sample for VOCs should not exceed 100 mL/min. Samples should be transferred directly to the final container 40 mL glass vials completely full and topped with a teflon cap. Once capped the vial must be inverted and tapped to check for headspace/air presence (bubbles). If air is present the sample vial will be discarded, and re-collected until free of air.
- Field filtration will be performed if dictated by the project Work Plan.
- Sample labels/sample identification
- All samples must be labeled with:
  - A unique sample number
  - Date and time
  - Parameters to be analyzed
  - Project Reference ID
  - Samplers initials
- Labels should be secured to the bottle and should be written in indelible inks.

## **EQUIPMENT/MATERIALS**

- pH meter, Conductivity meter, Dissolved Oxygen (DO) meter, Oxidation-reduction (redox) reaction potential (ORP) meter, Nephelometer, Temperature gauge
- Field filtration units (if required)
- Purging/sampling equipment
  - Peristaltic Pump (not suitable for VOCs<sup>1</sup>/SVOCs or depths >25 feet);
  - Suction Pumps (not suitable for LFP, VOCs/SVOCs, or depths >25 feet);
  - Submersible Pumps (suitable for VOCs/SVOCs only at low flow rates);
  - Air Lift Pumps (not suitable for VOCs/SVOCs); and
  - Bladder Pumps (suitable for LFR and VOCs/SVOCs);
- Water Level Probe
- Sampling Materials (containers, log book/forms, coolers, chain-of-custody)
- Work Plan
- Health and Safety Plan

NOTE<sup>1</sup>: PERISTALTIC PUMP USE FOR VOC COLLECTION IS NOT ACCEPTABLE ON EPA/RCRA SITES; THIS TECHNIQUE HAS GAINED ACCEPTANCE IN SELECT AREAS WHERE IT IS PERMISSIBLE TO COLLECT VOCs USING A PERISTALTIC PUMP AT A LOW FLOW RATE (EX. MICHIGAN).

## **FIELD NOTES**

- Field notes must document all the events, equipment used, and measurements collected during the sampling activities. SOP 1.2 describes the data/recording procedure for field activities. The log book should document the following for each well sampled:
  - Identification of well
  - Well depth
  - Static water level depth and measurement technique
  - Sounded well depth
  - Presence of immiscible layers and detection/collection method
  - Well yield – high or low
  - Purge volume and pumping rate
  - Time well purged
  - Measured field parameters
  - Purge/sampling device used

- Well sampling sequence
- Sampling appearance
- Sample odors
- Sample volume
- Types of sample containers and sample identification
- Preservative(s) used
- Parameters requested for analysis
- Field analysis data and method(s)
- Sample distribution and transporter
- Laboratory shipped to
- Chain of custody number for shipment to laboratory
- Field observations on sampling event
- Name collector(s)
- Climatic conditions including air temperature
- Problems encountered and any deviations made from the established sampling protocol.

A standard log form for documentation and reporting groundwater purging and sampling events are presented on Form 6.3-01 (Well Purging Field Information Form), 6.3-02 (Sample Collection Data Sheet), and 6.3-03 (Monitoring Well Record for Low-Flow Purging).

### **GROUNDWATER/DECON FLUID DISPOSAL**

- Groundwater disposal methods will vary on a case-by-case basis but may range from:
  - Off-site treatment at private treatment/disposal facilities or public owned treatment facilities
  - On-site treatment at Facility operated facilities
  - Direct discharge to the surrounding ground surface, allowing groundwater infiltration to the underlying subsurface regime
- Decon fluids should be segregated and collected separately from wash waters/groundwater containers.

## 5.6 SAMPLE NAMING, HANDLING, AND SHIPPING

### INTRODUCTION

Sample management is the continuous care given to each sample from the point of collection to receipt at the analytical laboratory. Good sample management ensures that samples are properly recorded, properly labeled, and not lost, broken, or exposed to conditions that may affect the sample's integrity.

All sample submissions must be accompanied with a chain-of-custody (COC) document to record sample collection and submission.

The following sections provide the minimum standards for sample management.

### PROCEDURES REFERENCED

#### A) Field Handling

Prior to entering the field area where sampling is to be conducted, especially at sites with defined exclusion zones, the sampler should ensure that all materials necessary to complete the sampling are on hand.

If samples must be maintained at a specified temperature after collection, proper coolers and ice/cool-packs must be brought out to the field. Consideration should be given to keeping reserve cooling media on hand if sampling events will be of long duration. Conversely, when sampling in extremely cold weather, proper protection of water samples, trip blanks, and field blanks must be considered.

Personnel performing groundwater sampling tasks must check the sample preparation and preservation requirements to ensure compliance with the Quality Assurance Project Plan. Typical sample preparation may involve pH adjustment (i.e., preservation), sample filtration and preservation, or simply cooling to 4°C. Sample preparation requirements vary from site to site and vary depending upon the analytical method for which the samples will be analyzed.

The sampling personnel must also confirm before the sample event, the amount of bottle filling required for the respective sample containers. VOC samples must not have any headspace within the sample collection vial; whereas when collecting select analytes (i.e., metals) a headspace must be provided to allow addition of the required preservative.

## B) Sample Labeling

Samples must be properly labeled as soon as practical after collection.

Note that the data shown on the sample label is the minimum data required. The sample label data requirements are listed below for clarity.

- i) Project name.
- ii) Sample number.
- iii) Sampler's initials.
- iv) Date of sample collection.
- v) Time of sample collection.
- vi) Analysis required.
- vii) Preservatives.

Quite often the analytical laboratory supplying the containers will provide blank sample labels. If these are adequate and convenient they can be used.

Under certain field conditions it is impractical to complete and attach sample labels to the container at the point of sample collection. However, to ensure that samples are not confused, a clear notation should be made on the container with a permanent marker indicating the last three digits of the sample number. If the containers are too soiled or small for marking, the container can be put into a "zip-lock" bag which can then be labeled.

No one sample number format is adequate for every type of sampling activity. Prior to the start of every project or sub-sampling event within the project, Project Managers and field personnel should devise a sample number format. Sample number formats should be as simple and short as possible. Sample number formats will reduce transcription errors by both Consultants and lab personnel. The sample number format should be comprehensive enough to allow for easy location of detailed sample data within the Site log books. Sample format must also be consistent with any future data management activities.

Unless otherwise instructed, labels should not contain specific names of the sample source (i.e., "Well No. 16"). Provision of such specific data on the label can produce biased lab results.

### Sample Labels/Sample Identification

All samples must be labeled with:

- a unique sample number (never to be re-used, nor likely to be);
- date and time;
- parameters to be analyzed; and

- sampler's initials.

Labels should be secured to the bottle and should be written in indelible ink. It is also desirable to place wide clear tape over the label before packing in a cooler for label protection during transportation.

The unique sample identification number may follow the format recommended below, or a specific sample protocol for labeling may be specified in the project RFI Work Plan.

XXXX-XXXXXX-XXXX

This format has been selected to maximize the information content of the sample number. Minor modifications are certainly reasonable.

- i) XXXX – Employee four-digit identification number
- ii) XXXXXX – Sample Date – Month/Date/Year
- iii) XXXX – Time (military)

Note that for Field Duplicates, Field Blanks, Equipment Blanks, Trip Blanks, Field Replicate, Known Duplicate, and Material Blank time will NOT be used. Instead we will use a sample number (ie. 0001, 0002, 0003), reset every day. This will simplify sample naming for the QA/QC samples and avoid identifying the parent sample for blind duplicates.

The decision of how to assign sample numbers will be made at the beginning of a job or phase, and should be consistent throughout the job.

#### C) Packaging

When possible, sample container preparation and packing for shipment should be completed in a well-organized and clean area, free of any potential cross-contaminants.

Sample containers should be prepared for shipment as follows:

- i) Containers should be wiped clean of all debris/water using paper towels (paper towels must be disposed of with other contaminated materials).
- ii) Clear, wide packing tape should be placed over the sample label for protection.

While there is no one "best" way to pack samples for shipment, the following packing guidelines should be followed.

- i) Plan time to pack your samples (and make delivery to shipper if applicable). Proper packing and manifesting takes time. A day's worth of sampling can be easily wasted due to a few minutes of neglect when packing the samples.
- ii) Always opt for more coolers and more padding rather than crowd samples. The cost associated with the packing and shipment of additional coolers is usually

- always small in comparison with the cost of having to re-sample due to breakage during shipment.
- iii) Do not bulk pack. Each sample must be individually padded.
  - iv) Large glass containers (1 liter and up) require much more space between containers.
  - v) Ice is not a packing material due to the reduction in volume when it melts.

The following is a list of standard guidelines that must be followed when packing samples for shipment.

- i) When using ice for a cooling media, always double bag the ice in "Zip-Lock" bags.
- ii) Double-check to ensure trip and temperature blanks have been included for all shipments containing VOCs, or where otherwise specified in the QA/QC plan.
- iii) Enclose the Chain-of-Custody form in a "Zip-Lock" bag.
- iv) Ensure custody seals (two, minimum) are placed on each cooler. Coolers with hinged lids should have both seals placed on the opening edge of the lid. Coolers with "free" lids should have seals placed on opposite diagonal corners of the lid. Place clear tape over custody seals.
- v) Ensure that all "Hazardous Material" stickers/markings have been removed from coolers being used which previously contained such materials.

*Note: Never store sterile sample containers in enclosures containing equipment which use any form of fuel or volatile petroleum based product. An alternate means of secure storage must be planned for. When conducting sampling in freezing conditions at sites without a heated storage area (free of potential cross contaminants), trip blanks not being used in a QA/QC role should be isolated from coolers immediately after receipt. Trip blanks should be double-bagged and kept from freezing.*

#### D) Chain-of-Custody Records

Chain-of-custody forms will be completed for all samples collected. The form documents the transfer of sample containers.

The chain-of-custody record, completed at the time of sampling, will contain, but not be limited to, the sample number, date and time of sampling, and the name of the sampler. The chain-of-custody document will be signed and dated by the sampler when transferring the samples.

Each sample cooler being shipped to the laboratory will contain a chain-of-custody form. The chain-of-custody form will consist of four copies which will be distributed as follows: The shipper will maintain a copy while the other three copies will be enclosed in a waterproof envelop within the cooler with the samples. The cooler will then be sealed

properly for shipment. The laboratory, upon receiving the samples, will complete the three remaining copies. The laboratory will maintain one copy for their records. One copy will be returned to the Field Coordinator upon receipt of the samples by the laboratory. One copy will be returned with the data deliverables package.

Chain-of-custody (COC) records are legal documents. They must be completed and handled accordingly.

The following list provides guidance for the completion and handling of all COCs.

- i) COCs used should be Consultant-standard forms or those supplied by the analytical laboratory. Do not use any COC forms from other labs, even if the heading is blocked out.
- ii) COCs must be completed in black ballpoint ink only.
- iii) COCs must be completed neatly using printed text.
- iv) If a simple mistake is made, line out the error with a single line and initial and date next to it.
- v) Each separate sample entry must be sequentially numbered.
- vi) The use of "Ditto" or quotation marks to indicate repetitive information in columnar entries should be avoided. If numerous repetitive entries must be made in the same column, place a continuous vertical arrow between the first entry and the next different entry.
- vii) When more than one COC form is used for a single shipment, each form must be consecutively numbered using the "Page \_\_\_\_ of \_\_\_\_" format.
- viii) If necessary, place additional instructions directly onto the COC. Do not enclose separate loose instructions.
- ix) Include a contact name and phone number on the COC in case there is a problem with the shipment.
- x) Do not indicate the source of the sample as this may produce a biased lab result.
- xi) Before using an acronym on a COC, define clearly the full interpretation of your designation [i.e., Polychlorinated Biphenyls - (PCBs)].

E) Shipment

In all but a few cases the QA/QC plan for the field work will require shipment of samples by overnight carrier. A great many problems can be avoided by proper advance planning. Prior to the start of the field sampling, the carrier should be contacted to determine if pickup can be made at the field site location. If pickup at the field site can be made, the "no-later-than" time for having the shipment ready must be determined.

If no pick-up is available at the Site, the nearest pick-up or drop-off location should be determined. Again, the "no-later-than" time for each location should be determined.

Sample shipments must not be left at unsecured or questionable drop locations (i.e., if the cooler will not fit in a remote drop box do not leave the cooler unattended next to the

drop box). Some overnight carriers do not in fact provide "overnight" shipment to/from some locations. Do not assume; call the carrier in advance before the start of the field work.

Copies of all shipment manifests must be maintained in the field file.

## **6.0 FIELD INSTRUMENTS – USE AND CALIBRATION**

### **INTRODUCTION**

A significant number of field activities involve usage of electronic instruments to monitor for environmental screening and health and safety purposes. It is imperative the instruments are used and maintained properly to optimize their performance and minimize the potential for inaccuracies in the data obtained, and to insure worker's health and safety is not compromised.

This SOP provides guidance on the usage, maintenance and calibration of electronic field equipment, whether for equipment owned by the Consultant or Contractor, or equipment obtained from a rental agency.

### **PROCEDURES REFERENCED**

- 1.2 Field Data Recording

### **PROCEDURE**

- All monitoring equipment will be in proper working order, and operated for the purpose for which it was intended, in accordance with manufacturer's recommendations.
- Field personnel will be responsible for insuring the equipment is maintained and calibrated in the field to extent practical, or returned for office or manufacturer maintenance or calibration if warranted. Calibration is discussed in greater detail below.
- A copy of the Operating Instructions, Maintenance and Service manual and calibration log, if available, for each instrument used on a project will be kept on site at all times.
- Instruments will be operated only by personnel trained in the proper usage and calibration. In the event certification of training is required, personnel will have documentation of such certification with them on site at all times.
- Personnel must be aware that certain instruments are rated for operation within a limited range of conditions such as temperature and humidity. Usage of such instruments in conditions outside these ranges will only proceed with proper approval by a project manager and/or Health and Safety supervisor as appropriate.

- Instruments that contain radioactive source material, such as x-ray fluorescence analyzers or moisture-density gauges require specific transportation, handling and usage procedures that are generally associated with a license from the Nuclear Regulatory Commission (NRC) or an NRC-Agreement State. Under no circumstance will operation of such instruments be allowed on site unless by properly authorized and trained personnel, using the proper personal dosimetry badges or monitoring instruments.

#### Calibration:

Calibration of an electronic instrument is critical to insure it is operating properly for its intended use. Such instruments are often sensitive to changes in temperature or humidity, or chemical vapors in the working atmosphere, and as a result their response and ability to monitor conditions and provide data can change significantly.

*Calibration:* Calibration of instruments shall be performed once at the beginning of every day and one additional time during the day. This includes the following parameters:

- Frequency
- Use of proper calibration Gases or Chemical Standards
- Requirements for Factory Calibration

*Calibration Gas Safety:* Several instruments such as photoionization detectors (PIDs), flame ionization detectors (FIDs), oxygen meters, explosimeters, combustible gas indicators and many others require use of calibration gasses contained in compressed gas cylinders. Many of these gases are combustible or explosive. Care shall be taken to minimize the potential for injury from the use of such compressed gases. Transport, handling and storage of cylinders, where necessary, shall be performed in accordance with applicable DOT regulations and site requirements.

Calibration will only be performed in areas free of sources of spark, flame or excessive heat. Smoking will not be allowed in the vicinity of calibration gas usage areas. In situations where an extreme temperature differential exists, the unit should be brought to the temperature it is used in and calibrated at that temperature.

*Documentation of Calibration:* Instrument calibration activities and maintenance activities will be documented on the appropriate field forms. In addition, protocol for documentation outlined in the Field Data Recording Procedure will be followed.

- Intrinsically Safe Requirements

Certain work locations may be such that dangerous, ignitable or explosive conditions exist. In such cases, it may be necessary to utilize only equipment that is rated as “Intrinsically Safe.” Intrinsically safe instrumentation is designed with limited electrical and thermal energy levels to eliminate the potential for ignition of hazardous mixtures.

For site work requiring operation of monitoring instruments in Class I, Division I locations (as defined by the National Fire Protection Agency (NFPA)) only instrumentation rated as Intrinsically Safe will be used. Such equipment (including all accessories and ancillary equipment) must be rated to conform to Underwriter’s Laboratories (UL) Standard 913, for use in a Class I, Division 1 Groups A, B, C, and D locations. It is also recommended the equipment conform with CSA Standard 22.2, No. 157-92.

- Upon completion of the field activities, equipment shall be returned to the possession of the Consultant, Contractor or Rental Agency accompanied by a written summary of any problems encountered with its use or calibration.
- Equipment shall be properly prepared for shipping, including insuring that residual gases (if applicable) are removed from the instrument, and accompanying containers of compressed gases or fluids are properly labeled and sealed.
- Equipment Decontamination

Equipment that comes in contact with Site media (water level meters, water quality meters) must be cleaned **before** removal from the site to ensure that chemicals are not transferred to other sites. It is the responsibility of the person who requisitioned the equipment to ensure appropriate cleaning before returning the equipment. Equipment decontamination procedures are typically site-specific for unique site compounds.

## **EQUIPMENT**

- Monitoring equipment specific to work plan tasks.
- Manufacturer’s instructions, operation and maintenance information.
- Associated calibration gases, aqueous standards, etc.
- Appropriate shipping containers to facilitate transport without damage to equipment.

## **REFERENCE**

- Underwriter's Laboratories, Inc. (<http://www.ul.com/hazloc/define.htm>) Standard UL 913.

- Canadian Standards Association (CSA) (<http://www.csa.ca>) Standard 22.2 No. 157

## 7.0 EQUIPMENT DECONTAMINATION

### INTRODUCTION

This procedure describes decontamination of field equipment potentially exposed to contaminants. Proper decontamination is required to reduce the risk of transfer of contaminants from areas of contamination to other areas and to minimize the potential for cross-contamination that would compromise sample quality. The degree of decontamination required will be dependent on the nature of the activity, equipment used and on the amount of exposure to contaminants.

### PROCEDURES REFERENCED

- 2.2 - Soil Borings
- 5.1 - Soil Sample Collection
- 5.2 - Groundwater Sampling
- 6.0 - Field Instruments – Use And Calibration

### PROCEDURE

#### A. General Procedure Discussion

Decontamination activities must be performed in a controlled area outside any exclusion zones established on the site. Care must be taken to minimize the potential for transfer of contaminated materials to the ground or onto other materials. Regardless of the size or nature of the equipment being decontaminated, the process will utilize a series of steps that involve removal of gross material (dirt, grease, oil etc.), washing with a detergent, and multiple rinsing steps. In lieu of a series of washes and rinse steps, steam cleaning with low-volume, high-pressure equipment (i.e. steam cleaner) is acceptable.

Drill rigs, backhoes and other exploration equipment, and all monitoring equipment (rented or not) in contact with the sampling media must be decontaminated prior to initiating site activities, in-between exploration locations to minimize cross-contamination potential, and prior to mobilizing off site after completion of site work. Heavy equipment is generally best decontaminated with a combination of steam-cleaning equipment and detergent scrubbing. Particular attention should be paid to parts in direct contact with contaminants, e.g. shovels, tires, augers, drilling decks, etc.

Control and containerization of all decontamination fluids is critical. A decontamination pad must be constructed that is appropriate for the size and type of equipment being

decontaminated. At a minimum, the decontamination pad will have the following elements:

- an impermeable barrier capable of containing decontaminated fluids;
- a low point where fluids will collect and can be pumped into appropriate containers;
- durability to withstand equipment such as vehicle and foot traffic;
- appropriate ancillary equipment such as racks to place decontaminated equipment to drain without further exposure to contaminated fluids;
- Labels to alert personnel as to the potential presence of contaminated materials.

B. Decontamination of Specific Sampling Equipment

The following specific decontamination procedure is recommended:

- Brush loose soil off of equipment;
- Wash equipment with laboratory grade detergent (i.e. Alconox or equivalent);
- Rinse with tap water (three rinses minimum);
- Rinse equipment with reagent grade methanol for VOC samples (this requirement may not be appropriate for sites where methanol is a contaminant of concern);
- Rinse equipment with nitric acid for metal samples (especially important for sites with potentially high metals concentrations);
- Rinse equipment with distilled water;
- Allow water to evaporate before reusing equipment; and
- Wrap equipment in aluminum foil when not being used.

C. Decontamination of Monitoring Equipment

Because monitoring equipment is difficult to decontaminate, care should be exercised to *prevent* contamination. Sensitive monitoring instruments should be protected when they are at risk of exposure to contaminants. This may include enclosing them in plastic bags allowing an opening for the sample intake. Ventilation ports should not be covered.

If contamination does occur, decontamination of the equipment will be required; however, immersion in decon fluids is not possible. As such, care must be taken to wipe the instruments down with detergent-wetted wipes or sponges, and then with deionized water-wetted wipes or sponges.

D. Disposal of Wash Solutions and Contaminated Equipment

All contaminated wash water, rinsates, solids and materials used in the decontaminated process that cannot be effectively decontaminated (such as polyethylene sheeting) will be containerized and disposed of in accordance with applicable regulations and site requirements. All containers will be labeled with an indelible marker as to contents and date of placement in the container, and any appropriate stickers required (such as PCBs).

Sampling of containerized wastes will be performed immediately upon completion of the investigations to minimize storage time on site. Storage of decon wastes on site will not exceed 90 days under any circumstances.

## **EQUIPMENT**

Decontamination equipment and solutions are generally selected based on ease of decontamination and disposability.

- Polyethylene sheeting;
- Metal racks to hold equipment;
- Soft-bristle scrub brushes or long-handle brushes for removing gross contamination and scrubbing with wash solutions;
- Large galvanized wash tubs, stock tanks, or wading pools for wash and rinse solutions;
- Plastic buckets or garden sprayers for rinse solutions;
- Large plastic garbage cans or other similar containers lined with plastic bags can be used to store contaminated clothing;
- Contaminated liquids and solids should be segregated and containerized in DOT-approved plastic or metal drums, appropriate for offsite shipping/disposal if necessary.

**Data Usability Summary Report (DUSR)**  
**Fort Calhoun NGS Blair, NE**  
**Analytical Laboratory: TestAmerica, Inc. - St. Louis, MO**  
**Sample Delivery Group # 160-19727-1**

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review (EPA 540-R-2016-001)
- USEPA National Functional Guidelines for Superfund Organic Methods Data Review (EPA 540-R-2016-002)

and method protocol criteria where applicable as prescribed by “Test Methods for Evaluating Solid Waste”, SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID
SD140300
SD140200
SD140100
SD140100 DUP

Sample ID
GW1101-20161024
GW1004-20161024

Project Samples were analyzed according to the following analytical methods:

	Parameter	Analytical Method	Holding Time Criteria
1.	Perfluorinated Alkyl Acids	EPA 537	14/28 days
2.	Mercury	EPA 7470A	28 days
3.	ICP Metals	EPA 6010C	180 days
4.	Perchlorate	EPA 314.0	28 days
5.	VOCs	EPA 8260B	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- NDEQ Regulations
- Holding Times
- Project-specific Reporting Limits
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Field Duplicate Sample Analysis
- Sample Data Reporting Format
- Data Qualifiers
- Summary

#### NDEQ Regulations

Reporting limits were all compared to the NDEQ action levels. All reporting limits were below NDEQ limits (Nebraska VCP Remedial Goals), with the following exceptions. Results were reported to the MDL.

Analyte	NDEQ Action Level (ug/L)	Reporting Limit (RL)	Method Detection Limit (MDL)	Status
Naphthalene (GW1004)	0.14	5.0	0.85	MDL > NDEQ Limit
Antimony (GW1101)	6.0	200	60	MDL > NDEQ Limit
Beryllium (GW1101)	4.0	100	30	MDL > NDEQ Limit
Cadmium (GW1101)	5.0	100	30	MDL > NDEQ Limit
Selenium (GW1101)	50	300	160	MDL > NDEQ Limit
Silver (GW1101)	100	200	60	MDL below limits.
Thallium (GW1101)	2.0	400	100	MDL > NDEQ Limit
Perchlorate (GW1101)	6.4	12	4.0	MDL below limits.

The lab cannot report any lower than this for Naphthalene. The metals were all diluted 10x for GW1101 due to high concentrations of other target analytes, thereby raising the reporting limits. The sample could not be run straight due to these high concentrations.

## Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group, with the following exception(s):

During the analysis of VOCs (EPA Method 8260B) preservation and/or technical holding times were exceeded for project samples shown below. Sample results should be qualified according to the actions specified in the following table:

Lab ID	Sample ID	Matrix	Action
160-19727-6	GW1004-20161024	Water	See Action #1 Below

### Action #1

*Sample was received with insufficient preservation for VOCs. Vials were not checked until time of analysis in order to avoid potential loss of volatile constituents. Sample was analyzed outside the 7 day unpreserved holding time. Qualify results "J-/R".*

During the analysis of Perfluorinated Acids (EPA Method 537) preservation and/or technical holding times were exceeded for project samples shown below. Sample results should be qualified according to the actions specified in the following table:

Lab ID	Sample ID	Matrix	Action
160-19727-6	GW1004-20161024	Water	See Action #1 Below

### Action #1

*Sample contained excessive sediment. The aqueous portion was decanted to a new bottle prior to spiking and extractions. No qualification is recommended.*

During the analysis of Metals (EPA Methods 6010B/6020/7470A/7471A) preservation and/or technical holding times were exceeded for project samples shown below. Sample results should be qualified according to the actions specified in the following table:

Lab ID	Sample ID	Matrix	Action
160-19727-5	GW1101-20161024	Water	See Action Below

### Action:

*Sample was received with insufficient preservation for metals and mercury. Nitric acid was added by the laboratory to adjust the pH under 2, but as 4 days passed between collection and delivery to the laboratory, results should be considered estimated "J-/UJ".*

## Project-specific Reporting Limits

The reporting limits for the samples within this Sample Delivery Group (SDG) met or exceeded the minimum reporting limit requirements specified by the Project-specific Quality Assurance Project Plan (QAPP). If a QAPP does not exist, all dilutions were still reviewed and found to be justified. Any exceptions are noted below:

During the analysis of Metals (EPA Methods 6010B/6020/7470A/7471A) the reporting limits were greater than the Project-specific Quality Assurance Project Plan (QAPP) criteria. The following project sample data as specified in the following table were affected:

Target Analyte(s)	QAPP RL	Sample ID	Lab Package RL	Reason	Action
All Metals	1x	GW1101-20161024	10x	Abundance of non-trgt analyte	No further action

## Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is found to be influenced by the amount found in any associated blank. USEPA method specific guidelines are followed when evaluating any detect found in a blank. Common laboratory contaminants include methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters. Target analytes were not detected in associated blank samples (trip, equipment, or method) collected, prepared and/or analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Qualifiers
Method Blank 277175	Mercury	0.0727 J ug/L	GW1101-20161024	J+ Due to multiple deficiencies, flag "J"

## System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria. No qualification of the data is recommended.

## Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R Criteria	%R	%RPD	Affected Sample(s)
GW1004-20161024	MS/MSD	BTEX + Naphthalene	Various	Within	Within	None, all within limit.

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R Criteria	%R	%RPD	Affected Sample(s)
SD140100 DUP	MS/MSD	Perfluorinated Acids	Various	Within	Within	None, all within limits.

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R	Affected Sample(s)	Positive Results	Non Detect (ND)
160-19589-D-12	MS/MSD	Perchlorate	Low	None, not HA Sample.		

## Field Duplicate Sample Analysis

The overall variability attributable to the sampling procedure, sample matrix, and laboratory procedures, was evaluated by assessing the relative percent difference (RPD) data from field duplicate samples. All calculated RPD values were within matrix specific data quality objectives, with the exception of results qualified "J" as shown in the table(s) below:

Target Analyte(s)	Original Sample ID.	FD Sample ID.	%RPD	Flag Original and FD sample results with:
	SD140100	SD140100 DUP		
Perfluorooctanesulfonic acid	0.23 J ug/kg	0.2 U ug/kg	NA	None, Abs. Diff < RL
Perfluorooctanoic Acid	0.63 ug/kg	0.39 ug/kg	NA	None, Abs. Diff < RL
Perfluorohexanesulfonic acid	0.19 U ug/kg	0.19 U ug/kg	NA	None, Both ND.
Perfluorobutane Sulfonate	0.17 U ug/kg	0.16 U ug/kg	NA	None, Both ND.
Perfluoroheptanoic acid	0.36 ug/kg	0.26 J ug/kg	NA	None, Abs. Diff < RL
Perfluorononanoic Acid	0.6 ug/kg	0.46 ug/kg	NA	None, Abs. Diff < RL

### Action:

*If the sample matrix is solid and the %RPD is greater than 50%, the original sample results are qualified "J". If the sample matrix is water or air and the %RPD is greater than 35%, the original sample results are qualified "J".*

### **Sample Data Reporting Format**

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

### **Data Qualifiers**

Samples that contain results between the MDL and RL were flagged as estimated, "J", by the laboratory. The data user should be aware that there is a possibility of false positive or mis-identification at the quantitation levels. The laboratory also qualified results when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

### **Summary**

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Date: 12/12/2016

**Data Usability Summary Report (DUSR)**  
**Fort Calhoun Nuclear Station**  
**Analytical Laboratory: GEL Laboratories LLC. - Charleston, SC**  
**Sample Delivery Group # 409254**

Analytical results for the project samples were reviewed to evaluate the data usability. Data was assessed in accordance with guidance from the following Federal and/or State guidance documents:

- USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review (EPA 540-R-2016-001)
- USEPA National Functional Guidelines for Superfund Organic Methods Data Review (EPA 540-R-2016-002)

and method protocol criteria where applicable as prescribed by “Test Methods for Evaluating Solid Waste”, SW846, Update III, 1996, or Standard Methods for the Examination of Water and Wastewater, Eds 18-20.

This DUSR pertains to the following samples:

Sample ID	Sample ID	Sample ID
DP010109	DP060212	DP110202
DP010216	DP060212DUP	DP110204

8.	PAHs	EPA 8270D SIM	14 days ext/40 days analysis
9.	TPH(d)	EPA 8015C	14 days

The following items/criteria applicable to the analysis of project samples and associated QA/QC procedures were reviewed.

- Case Narrative
- NDEQ Regulations
- Holding Times
- Project-specific Reporting Limits
- Blank Sample Analysis
- System Monitoring Compound Recoveries
- Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries
- Field Duplicate Sample Analysis
- Sample Data Reporting Format
- Data Qualifiers
- Summary

## Case Narrative

The laboratory included the below notes of interest in the method case narratives:

- The trip blank was a soil trip blank that did not have any soil added. Therefore, the laboratory added 5g of sand as the sample aliquot for calculation purposes.
- Samples 013-018 were slightly muddy. 019 was very wet. 026-028 contained moist soil. 028 appeared greasy while concentrating on the TurboVap and did not concentrate to 1ml.
- During PCB analysis, all samples were cleaned using both alumina in order to remove oil and other high molecular weight interferences and activated copper in order to remove sulfur.
- Method SW-846 3050B (prep method for metals) is not a total digestion technique for most samples. It is a very strong acid digestion that will dissolve almost all elements that could become environmentally available. By design, elements bound in silicate structures are not normally dissolved by this procedure as they are not usually mobile in the environment.

## NDEQ Regulations

Reporting limits were all compared to the NDEQ action levels. All reporting limits were below NDEQ limits (Nebraska VCP Remedial Goals), with the following exceptions. Results were reported to the MDL.

Analyte	NDEQ Action Level (mg/kg)	Reporting Limit (RL)	Method Detection Limit (MDL)	Status
Benzo(b)fluoranthene	0.15	1.050	0.523	MDL > NDEQ Limit

Sample SS050100 was diluted 200x due to the presence of non-target analytes. This dilution elevated the reporting limit above NDEQ standards. Samples run straight were reported at limits below the NDEQ standards.

## Preservation and Holding Times

Maximum allowable holding times, measured from the time of sample collection to the time of sample preparation or analysis, were met for each project sample analyzed as part of this sample delivery group, with the following exception(s):

During the analysis of VOCs (EPA Method 8260B) preservation and/or technical holding times were exceeded for project samples shown below. Sample results should be qualified according to the actions specified in the following table:

Lab ID	Sample ID	Matrix	Action
409254015	SD140100	Soil	See Action #1 Below
409254016	SD140100 DUP	Soil	See Action #1 Below
409254014	SD140200	Soil	See Action #1 Below
409254013	SD140300	Soil	See Action #1 Below
409254011	SS110100	Soil	See Action #1 Below
409254012	SS110200	Soil	See Action #1 Below

### Action #1

*Soil samples were collected for VOC analysis using O2SI soil kit. These kits are frozen on arrival to the laboratory to arrest the 48 hour holding time. Samples collected on 10/24 (listed above) were delivered to the lab beyond the 48 hour holding time. The results for these samples should be qualified estimated, "J-UJ".*

### Project-specific Reporting Limits

The reporting limits for the samples within this Sample Delivery Group (SDG) met or exceeded the minimum reporting limit requirements specified by the Project-specific Quality Assurance Project Plan (QAPP). If a QAPP does not exist, all dilutions were still reviewed and found to be justified. Any exceptions are noted below:

During the analysis of SVOCs (EPA Method 8270C) the reporting limits were greater than the Project-specific Quality Assurance Project Plan (QAPP) criteria. The following project sample data as specified in the following table were affected:

Target Analyte(s)	QAPP RL	Sample ID	Lab Package RL	Reason	Action
All PAHs	1x	SS050100	200x	Abundance of non-trgt analyte	No further action

During the analysis of PCBs (EPA Method 8082) the reporting limits were greater than the Project-specific Quality Assurance Project Plan (QAPP) criteria. The following project sample data as specified in the following table were affected:

Target Analyte(s)	QAPP RL	Sample ID	Lab Package RL	Reason	Action
All PCBs	1x	SS050100	10x	Diluted due to extract thickness	No Further Action

During the analysis of Metals (EPA Methods 6010B/6020/7470A/7471A) the reporting limits were greater than the Project-specific Quality Assurance Project Plan (QAPP) criteria. The following project sample data as specified in the following table were affected:

Target Analyte(s)	QAPP RL	Sample ID	Lab Package RL	Reason	Action
Beryllium	1x	DP010216	20x	Dilution req'd by sample matrix	No further action
Beryllium	1x	409254011 - 19	10x	Dilution req'd by sample matrix	No further action
Antimony	1x	DP010216	10x	Dilution req'd by sample matrix	No further action
Silver	1x	SS110100	10x	Dilution req'd by sample matrix	No further action
Thallium	1x	409254012, 17-20	10x	Dilution req'd by sample matrix	No further action

*The samples were prepared at a 10x dilution or greater to minimize potential interferences arising from the SPLP leaching solution.*

### Blank Sample Analysis

In accordance with cited USEPA guidelines, positive sample results should be reported unless the concentration of the compound in the project sample is found to be influenced by the amount found in any associated blank. USEPA method specific guidelines are followed when evaluating any detect found in a blank. Common laboratory contaminants include methylene chloride, acetone, 2-butanone, cyclohexane, and phthalate esters. Target analytes were not detected in associated blank samples (trip, equipment, or method) collected, prepared and/or analyzed concurrently with the project samples, with the following exception(s):

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Qualifiers
TB102616	Tetrachloroethene	0.4 J ug/kg	409254011-13, 15, 29, 38	U
Trip Blank	Methylene chloride	2.79 J ug/kg	None, samples all ND.	None.
Method Blank - VOCs 1612391	Methylene chloride	2.14 J ug/kg	None. Associated samples are all ND.	None.
Method Blank - DRO 1612127	TPH - DRO	3190 J ug/kg	DP060212 DP060113 DP060321 DP060212DUP	U U U J+

Blank	Target Analyte(s)	Concn.	Affected Sample(s)	Qualifiers
Method Blank 1203657595	Calcium, Total Sodium, Total Zinc, Total	20200 J ug/kg 17500 J ug/kg 662 J ug/kg	None, samples >10x blank None, samples >10x blank None, samples >10x blank	None. None. None.

#### System Monitoring Compound Recoveries

System monitoring/surrogate compounds are added to each sample prior to analysis of organic parameters to confirm the efficiency of the sample preparation procedure. The calculated recovery for each surrogate compound was evaluated to confirm the accuracy of the reported results. The calculated recovery of these compounds fell within the laboratory specific quality control criteria, with the following exception(s):

Semi-Volatile Surrogate Percent Recovery Criteria			
Surrogate		Aqueous Matrix (%)	Solid Matrix (%)
5-alpha-Androstane	S01	- -	30 - 118

Project Sample ID	Matrix	S01 %R	Acid		Base/Neutral	
			Positive Results	Non Detect (ND)	Positive Results	Non Detect (ND)
SS050100	SO	0	None, sample diluted $\geq 5x$ (200x)			

PCB Surrogate Percent Recovery Criteria			
Surrogate		Aqueous Matrix (%)	Solid Matrix (%)
Tetrachloro-m-xylene	S01	- -	30 - 120
Decachlorobiphenyl	S02	- -	32 - 139

Project Sample ID	Matrix	S01 %R	S02 %R	Applies to List S01		Applies to List S02	
				Positive Results	Non Detect (ND)	Positive Results	Non Detect (ND)
SS050100 (Col. 1)	Soil	33	46	None, sample diluted $\geq 5x$ (10x)			
SS050100 (Col. 2)	Soil	25	42	None, sample diluted $\geq 5x$ (10x)			

#### Laboratory Control Samples, Matrix Spike/Matrix Spike Duplicate Recoveries

Analytical precision and accuracy was evaluated based on the laboratory control and matrix spike sample analyses performed concurrently with the project samples. For matrix spike samples, after the addition of a known amount of each target analyte to the sample matrix, the sample was analyzed to confirm the ability to identify these compounds within the sample matrix. For LCS analyses, after the addition of a known amount of each target analyte into laboratory reagent water, the sample was analyzed to confirm the ability of the analytical system to accurately quantify the compounds. The reported recovery of MS/MSD and LCS analyses fell within the laboratory QA acceptance criteria, with the following exception(s):

LCS ID / Project Sample MS	Type	Target Analyte(s)	%R Criteria	%R	%RPD	Affected Sample(s)
DP060321	MS	TPH - DRO	32 - 127	97	32	DP060321

SS110100	MS	Perchlorate	103	None, within limits.		

## Duplicate Sample Analysis

The replicate percent difference (RPD) was evaluated for each duplicate sample pair to monitor the reproducibility of the data. The RPD for each sample pair was within the QA/QC limit of 30% for aqueous samples and 50% for solid matrices, for those target analytes with sample concentrations >5X the MDL, with the following exception(s):

Sample ID	Matrix	Target Analyte(s)	RPD	Affected Sample(s)
DP110100	SO	Antimony, Total	38.5	All Project Samples
		Lead, Total	153	All Project Samples
		Manganese, Total	20.4	All Project Samples
DP010109	SO	Aluminum, Total	21.8	All Project Samples
		Arsenic, Total	24.9	All Project Samples
		Barium, Total	23.4	All Project Samples
		Cadmium, Total	32.5	None, Abs. Diff < RL.
		Copper, Total	24.1	All Project Samples
		Lead, Total	20.8	All Project Samples
		Silver, Total	33.4	All Project Samples
DP010216 - SPLP	SO	Arsenic, Total	32.3	None, Abs. Diff < RL.

Sample ID	Matrix	Target Analyte(s)	RPD	Affected Sample(s)
SS110100 - Totals	SO	Mercury	19	None, within limits.
DP010216 - SPLP	SO	Mercury	NA	None, Both ND.

Sample ID	Matrix	Target Analyte(s)	RPD	Affected Sample(s)
SS110100	SO	Perchlorate	NA	None, Both ND.

### Action:

Analytes with RPDs greater than 20% should be qualified "J" and non-detects qualified "UJ".

## Field Duplicate Sample Analysis

The overall variability attributable to the sampling procedure, sample matrix, and laboratory procedures, was evaluated by assessing the relative percent difference (RPD) data from field duplicate samples. All calculated RPD values were within matrix specific data quality objectives, with the exception of results qualified "J" as shown in the table(s) below:

Target Analyte(s)	Original Sample ID.	FD Sample ID.	%RPD	Flag Original and FD sample results with:
	SD140100	SD140100 DUP		
2-Butanone (MEK)	4.48 J ug/kg	8.58 U ug/kg	NA	None, Abs. Diff < RL
Acetone	15.5 ug/kg	7.28 J ug/kg	NA	None, Abs. Diff < RL
Tetrachloroethene	0.539 J ug/kg	1.72 U ug/kg	NA	None, Abs. Diff < RL

Sodium, Total	263000 ug/kg	248000 ug/kg	6%	None, RPD < 50%
Thallium, Total	728 U ug/kg	766 U ug/kg	NA	None, Both ND.
Vanadium, Total	33300 ug/kg	33200 ug/kg	0%	None, RPD < 50%
Zinc, Total	106000 ug/kg	108000 ug/kg	2%	None, RPD < 50%

Target Analyte(s)	Original Sample ID.	FD Sample ID.	%RPD	Flag Original and FD sample results with:
	SD140100	SD140100 DUP		
Mercury	35.5 ug/kg	36.5 ug/kg	3%	None, RPD < 50%

Target Analyte(s)	Original Sample ID.	FD Sample ID.	%RPD	Flag Original and FD sample results with:
	SD140100	SD140100 DUP		
Perchlorate	21.6 U ug/kg	21.1 U ug/kg	NA	None, Both ND.

Action:

*If the sample matrix is solid and the %RPD is greater than 50%, the original sample results are qualified "J". If the sample matrix is water or air and the %RPD is greater than 35%, the original sample results are qualified "J".*

### **Sample Data Reporting Format**

The sample data are presented using USEPA Contract Laboratory Protocol (CLP) format or equivalent. The data package has been reviewed for completeness and found to contain each required sample result and associated QA/QC report form. The reporting format is complete and compliant with the objectives of the project. No qualification of the data is recommended.

### **Data Qualifiers**

Samples that contain results between the MDL and RL were flagged as estimated, "J", by the laboratory. The data user should be aware that there is a possibility of false positive or mis-identification at the quantitation levels. The laboratory also qualified results when target analytes were detected in the associated method/preparation blank sample. Based on a spot check of the data qualifiers used, these flags appeared to be applied to the reported results in accordance with EPA guidance.

### **Summary**

The results presented in each report were found to be compliant with the data quality objectives for the project and usable. Based on our review, the usability of the data is 100%, with the few exceptions noted above.

Date: 12/13/2016

**Job ID: 160-19727-1**

**Laboratory: TestAmerica St. Louis**

## Narrative

### CASE NARRATIVE

**Client: Haley & Aldrich, Inc.**

**Project: Fort Calhoun NGS Blair, NE**

**Report Number: 160-19727-1**

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica St. Louis attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

### RECEIPT

The samples were received on 10/28/2016; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 4.9 C.

### **Receipt Exceptions**

The following sample was received with insufficient preservation: GW1101 (160-19727-5). Nitric acid preservative was added by the laboratory, and the sample(s) pH was adjusted to < 2 SU.

### **VOLATILE ORGANIC COMPOUNDS (GC MS)**

Sample GW1004 (160-19727-6) was analyzed for volatile organic compounds (GC MS) in accordance with EPA SW-846 Method 8260C. The samples were analyzed on 11/05/2016.

### Analytical Batch: 277750

Sample was presumed to be preserved to a pH < 2. Due to the potential loss of volatile constituents, VOA vials are not checked for pH

## Case Narrative

Client: Haley & Aldrich, Inc.  
Project/Site: Fort Calhoun NGS Blair, NE

TestAmerica Job ID: 160-19727-1

### Job ID: 160-19727-1 (Continued)

#### Laboratory: TestAmerica St. Louis (Continued)

preservation until the time of analysis. Sample pH was not less than 2. Sample was analyzed outside the 7 day, unpreserved, holding time. GW1004 (160-19727-6), (160-19727-A-6 MS) and (160-19727-A-6 MSD)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### PERCHLORATE

Sample GW1101 (160-19727-5) was analyzed for perchlorate in accordance with EPA Method 314.0. The samples were analyzed on 11/09/2016.

##### Analytical Batch: 278496

The following matrix spike duplicate (MSD) recovered below the lower acceptance limit of 80% (72%) in Perchlorate batch 160-278496: (160-19589-D-12 MS) and (160-19589-D-12 MSD) The matrix spike (MS) recovered within acceptance limits at 85%, and the RPD between the MS and MSD was within 20% criteria. This MSD recovery excursion is attributed to sample matrix interference, because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### PERFLUORINATED HYDROCARBONS

Sample GW1004 (160-19727-6) was analyzed for Perfluorinated Hydrocarbons in accordance with EPA 537 (modified). The samples were prepared on 10/31/2016 and analyzed on 11/02/2016 and 11/03/2016.

Samples SD140300 (160-19727-1), SD140200 (160-19727-2), SD140100 (160-19727-3) and SD140100 DUP (160-19727-4) were analyzed for Perfluorinated Hydrocarbons (LC/MS) in accordance with EPA 537 (modified). The samples were prepared on 10/31/2016 and analyzed on 11/03/2016.

##### Analytical Batch: 135762

Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 320-135232. An LCS/LCSD was performed to demonstrate precision.

Due to the excessive of sediment in the sample bottle, the aqueous portion of these samples was decanted to new bottle prior to spiking and the extraction. GW1004 (160-19727-6)

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### TOTAL METALS (ICP)

Sample GW1101 (160-19727-5) was analyzed for total metals (ICP) in accordance with EPA SW-846 Method 6010C. The samples were prepared on 11/08/2016 and analyzed on 11/09/2016.

##### Analytical Batch: 278522

The initial calibration verification (ICV) result for batch analytical batch 160-278522 was above the upper control limit for Thallium. Sample results were below the reporting limit, and have been reported as qualified data. (ICV 160-278522/5)

Due to the high concentration of Calcium, matrix spike duplicate (MSD) for preparation batch 160-278261 and analytical batch 160-278522 could not be evaluated for accuracy and precision. (160-19687-D-3-C MSD)

The following samples were diluted to bring the concentration of target analytes within the calibration range: GW1101 (160-19727-5). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### TOTAL MERCURY

Sample GW1101 (160-19727-5) was analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared and analyzed on 10/31/2016.

##### Analytical Batch: 277175

## Case Narrative

Client: Haley & Aldrich, Inc.  
Project/Site: Fort Calhoun NGS Blair, NE

TestAmerica Job ID: 160-19727-1

---

### Job ID: 160-19727-1 (Continued)

---

#### Laboratory: TestAmerica St. Louis (Continued)

Mercury was detected in method blank MB 160-276813/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### PERCENT SOLIDS

Samples SD140300 (160-19727-1), SD140200 (160-19727-2), SD140100 (160-19727-3) and SD140100 DUP (160-19727-4) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 11/08/2016.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Definitions/Glossary

Client: Haley & Aldrich, Inc.  
Project/Site: Fort Calhoun NGS Blair, NE

TestAmerica Job ID: 160-19727-1

### Qualifiers

#### HPLC/IC

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

#### LCMS

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

#### Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Method Summary

Re: Fort Calhoun Nuclear Station  
Work Order: 409254

Dear Mr. Noordennen:

GEL Laboratories, LLC (GEL) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on October 27, 2016. This original data report has been prepared and reviewed in accordance with GEL's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at (843) 556-8171, ext. 4453.

Sincerely,

  
Kaitlyn Stone for  
Edith Kent  
Project Manager

# Case Narrative

**Receipt Narrative  
for  
Haley & Aldrich, Inc.  
SDG: 409254**

**November 18, 2016**

**Laboratory Identification:**

GEL Laboratories LLC  
2040 Savage Road  
Charleston, South Carolina 29407  
(843) 556-8171

**Summary:**

**Sample receipt:** The samples arrived at GEL Laboratories LLC, Charleston, South Carolina on October 27, 2016 for analysis. The samples were delivered with proper chain of custody documentation and signatures. All sample containers arrived without any visible signs of tampering or breakage. The client was notified that samples 409254011(SS110100), 409254012(SS110200), 409254013(SD140300), 409254014(SD140200), 409254015(SD140100), and 409254016(SD140100DUP) were received out of holding time for low level VOAs. The client directed the lab to proceed with analysis.

**Sample Identification:** The laboratory received the following samples:

**Case Narrative:**

Sample analyses were conducted using methodology as outlined in GEL's Standard Operating Procedures. Any technical or administrative problems during analysis, data review, and reduction are contained in the analytical case narratives in the enclosed data package.

The enclosed data package contains the following sections: Case Narrative, Chain of Custody, Cooler Receipt Checklist, Data Package Qualifier Definitions and data from the following fractions: Diesel Range Organics, GC Semivolatile PCB, GC/MS Semivolatile, GC/MS Volatile, General Chemistry, Metals and Project Management.

Soil kits have a holding time of 48 hours. We will proceed with analysis on all samples. Thanks for the quick response

Brielle

Hi Miles,

We received a shipment today for PO 127960-002 GEL workorder 409254 and the volatile soil kits that were collected on 10/24/16 were received at GEL out of holding. Would you like us to proceed with analysis?

Thanks,  
Brielle

Samples 409254011,012,013,014,015,016,029,032,034,036 and 038 in this SDG were analyzed on a "dry weight corrected" basis. Sample 409254044 in this SDG was analyzed on an "as received" basis.

**Data Summary:**

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

**Quality Control (QC) Information**

**Blank (MB) Statement**

Target analytes were detected in the blank 1203660807 (MB) below the reporting limit.

**Technical Information**

**Sample Re-extraction/Re-analysis**

Samples 409254029 (DP020312) and 409254036 (DP020209) were re-analyzed due to unacceptable surrogate or

internal standard recoveries in the initial analysis. The re-analyses confirmed/and or passed and were reported.

#### **Miscellaneous Information**

##### **Additional Comments**

The samples were collected in O2SI soil kits. HAAL sample 409254044 (TB102616) was a soil trip blank that did not have soil added, therefore 5g was used as the sample aliquot for calculation purposes.

#### **Certification Statement**

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

2040 Savage Road Charleston SC 29407 - (843) 556-8171 - www.gel.com

### Qualifier Definition Report for

HAAL002 Haley & Aldrich, Inc.

Client SDG: 409254 GEL Work Order: 409254

#### The Qualifiers in this report are defined as follows:

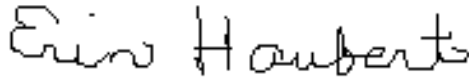

- \* A quality control analyte recovery is outside of specified acceptance criteria
- \*\* Analyte is a surrogate compound
- B The target analyte was detected in the associated blank.
- J Value is estimated
- U Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.
- DL Indicates that sample is diluted.
- RA Indicates that sample is re-analyzed without re-extraction.
- RE Indicates that sample is re-extracted.

#### Review/Validation

GEL requires all analytical data to be verified by a qualified data reviewer. In addition, all CLP-like deliverables receive a third level review of the fractional data package.

The following data validator verified the information presented in this data report:

Response Factor Report VOA4

GEL Laboratories, LLC

Method File : C:\msdchem\1\data\103116V4\VOA4-8260-103116.M

Last Update : Tue Nov 01 08:22:19 2016

Integrator : (RTE Integrator)

Response via : Initial Calibration

For Linear Calibration: x = concentration ratio, y = response ratio.  $y = b + m1(x) + m2(xE2)$

b	Compound m1	m2	8 6	1 7	2 9	3	4	5	Avg	Curve	Exp	%RSD/r2
112)B	bis(2-Chloroisopropyl)et			22681	22934		181179	345542				
0.0717	0.3951	0.00	932501	1610266						LINR	#	0.9936

(#) = Out of Range (\$) = Individual RF Out of Range

AVRG = Average, LINR = Linear Regression,  $1/x$  = the inverse of concentration,  $1/x^2$  = the inverse square of concentration

## Continuing Calibration Summary

**Instrument ID:** VOA4.I  
**Data File:** 103116V4\4H112.D  
**Lab Sample ID** W4VM161031-10  
**Quant Type** ISTD

**Injection Date:** 31-OCT-16 21:46  
**Init. Cal. Date(s)** 31-OCT-16 16:55 01-NOV-16 00:4  
**Method:** 103116V4\VOA4-8260-103116.M

Compound	AVERF / Amount	RF CCV	Nominal CCV	Min RF	RF Q	%D / %Drift	Max	Drift Q	Curve Type

# **Semi-Volatile Analysis**

# Case Narrative

**GC/MS Semivolatile  
Technical Case Narrative  
Haley & Aldrich, Inc. (HAAL)  
SDG #: 409254**

**Product:** Analysis of Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry

**Analytical Method:** SW846 3541/8270D SIM PAH

**Analytical Procedure:** GL-OA-E-009 REV# 38

**Analytical Batch:** 1612777

**Preparation Method:** SW846 3541

**Preparation Procedure:** GL-OA-E-066 REV# 7

**Preparation Batch:** 1612776

The following samples were analyzed using the above methods and analytical procedure(s).

<b><u>GEL Sample ID#</u></b>	<b><u>Client Sample Identification</u></b>
409254013	SD140300
409254014	SD140200
409254015	SD140100
409254016	SD140100DUP
409254017	DP100113
409254018	DP100212
409254019	DP100310
409254026	DP050113
409254027	DP050213
409254028	SS050100
1203661742	Method Blank (MB)
1203661743	Laboratory Control Sample (LCS)
1203661744	409254013(SD140300) Matrix Spike (MS)
1203661745	409254013(SD140300) Matrix Spike Duplicate (MSD)

The samples in this SDG were analyzed on a "dry weight" basis.

**Data Summary:**

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

**Quality Control (QC) Information**

**Surrogate Recoveries**

Sample (See Below) did not meet surrogate recovery acceptance criteria. The sample was analyzed at a dilution. As a result, one or more surrogates were diluted out of the acceptance limits.

Sample	Analyte	Value
409254028 (SS050100)	5-alpha-Androstane	0* (30%-118%)

**Technical Information**

**Sample Dilutions**

Sample 409254028 (SS050100) was diluted due to the presence of non-target analytes. The data from the dilution are reported.

**Miscellaneous Information****Manual Integrations**

Samples 409254016 (SD140100DUP) and 409254027 (DP050213) required manual integration to correctly position the baseline as set in the calibration standard injections.

**Product:** Analysis of Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry

**Analytical Method:** SW846 3541/8270D

**Analytical Procedure:** GL-OA-E-009 REV# 38

**Analytical Batch:** 1614270

**Preparation Method:** SW846 3541

**Preparation Procedure:** GL-OA-E-066 REV# 7

**Preparation Batch:** 1614269

The following samples were analyzed using the above methods and analytical procedure(s).

<b><u>GEL Sample ID#</u></b>	<b><u>Client Sample Identification</u></b>
409254029	DP020312
409254032	DP020413
409254034	DP020207
409254036	DP020209
409254038	DP020114
1203665318	Method Blank (MB)
1203665319	Laboratory Control Sample (LCS)
1203665320	409286001(NonSDG) Matrix Spike (MS)
1203665321	409286001(NonSDG) Matrix Spike Duplicate (MSD)

The samples in this SDG were analyzed on a "dry weight" basis.

**Data Summary:**

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

**Quality Control (QC) Information****Surrogate Recoveries**

Sample (See Below) did not meet surrogate recovery acceptance criteria. Since the parent sample and associated MS/MSD pair displayed similar recoveries, the failures were attributed to matrix interference and the data results are reported.

Sample	Analyte	Value
1203665320 (Non SDG 409286001MS)	2,4,6-Tribromophenol	32* (39%-115%)

**Spike Recovery Statement**

The MS or MSD (See Below) recovered spiked analytes outside of the established acceptance limits. As similar recoveries were displayed in the MS and MSD, the failures were attributed to sample matrix interference and the data were reported.

Sample	Analyte	Value
1203665320 (Non SDG 409286001MS)	Several	See applicable report
1203665321 (Non SDG 409286001MSD)	Several	See applicable report

#### **MS/MSD Relative Percent Difference (RPD) Statement**

The relative percent differences (RPD) for the MS and MSD, (See Below), were not within the acceptance limits. The failures were attributed to matrix interference. The data were reported.

Sample	Analyte	Value
1203665320MS and 1203665321MSD (Non SDG 409286001)	2,3,4,6-Tetrachlorophenol	74* (0%-30%)
	2,4,5-Trichlorophenol	56* (0%-30%)
	2,4,6-Trichlorophenol	62* (0%-30%)
	2-Methyl-4,6-dinitrophenol	200* (0%-30%)
	Hexachlorocyclopentadiene	36* (0%-30%)
	Pentachlorophenol	79* (0%-30%)

#### **Certification Statement**

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

### Qualifier Definition Report for

HAAL002 Haley & Aldrich, Inc.

Client SDG: 409254 GEL Work Order: 409254

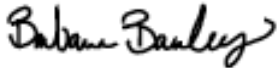

#### The Qualifiers in this report are defined as follows:

- \* A quality control analyte recovery is outside of specified acceptance criteria
- \*\* Analyte is a surrogate compound
- J Value is estimated
- U Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.
- DL Indicates that sample is diluted.
- RA Indicates that sample is re-analyzed without re-extraction.
- RE Indicates that sample is re-extracted.

#### Review/Validation

GEL requires all analytical data to be verified by a qualified data reviewer. In addition, all CLP-like deliverables receive a third level review of the fractional data package.

The following data validator verified the information presented in this data report:

Signature: 

Name: Barbara Bailey

Date: 16 NOV 2016

Title: Data Validator

### DATA EXCEPTION REPORT

<b>Mo.Day Yr.</b> 14-NOV-16	<b>Division:</b> Industrial	<b>Quality Criteria:</b> Specifications	<b>Type:</b> Process
<b>Instrument Type:</b> SEMIVOA GC/MS	<b>Test / Method:</b> SW846 3541/8270D	<b>Matrix Type:</b> Solid	<b>Client Code:</b> CARE, HAAL, ARSL(LANL),
<b>Batch ID:</b> 1614270	<b>Sample Numbers:</b> See Below		

**Potentially affected work order(s)(SDG): 409239,409254,409286(2017-257),409831(EUI-10351),409833(EUI-10352)**

**Application Issues:**

Failed Recovery for MS/MSD, or PS/PSD

Failed RPD for MS/MSD, or PS/PSD

Failed Yield for Surrogates

Manual Integration

**Specification and Requirements  
Exception Description:**

1. Sample 409831001 and QC sample 1203665320MS failed surrogate recovery.

2. The 1203665320MS and 1203665321MSD failed spike recovery.

3. The RPD values between the 1203665320MS and 1203665321MSD were not within the acceptance limits.

**DER Disposition:**

1. Sample (See Below) did not meet surrogate recovery acceptance criteria. The sample was analyzed at a dilution. As a result, one or more surrogates were diluted out of the acceptance limits.  
409831001 (0680-05-0022 L125220) 2,4,6-Tribromophenol [0\* (39%-115%)], 2-Fluorobiphenyl [170\* (35%-107%)], 2-Fluorophenol [0\* (36%-104%)], Nitrobenzene-d5 [0\* (34%-109%)], Phenol-d5 [0\* (39%-106%)] and p-Terphenyl-d14 [130\* (45%-119%)].

Sample (See Below) did not meet surrogate recovery acceptance criteria. Since the parent sample and associated MS/MSD pair displayed similar recoveries, the failures were attributed to matrix interference and the data results are reported.  
1203665320 (WST03-17-127184MS) 2,4,6-Tribromophenol [32\* (39%-115%)].

2. The MS or MSD (See Below) recovered spiked analytes outside of the established acceptance limits. As similar recoveries were displayed in the MS and MSD, the failures were attributed to sample matrix interference and the data were reported.  
1203665320 (WST03-17-127184MS) Several [See applicable report].  
1203665321 (WST03-17-127184MSD) Several [See applicable report].

3. The relative percent differences (RPD) for the MS and MSD, (See Below), were not within the acceptance limits. The failures were attributed to matrix interference. The data were reported.  
1203665320MS and 1203665321MSD (WST03-17-127184) 2,3,4,6-Tetrachlorophenol [74\* (0%-30%)], 2,4,5-Trichlorophenol [56\* (0%-30%)], 2,4,6-Trichlorophenol [62\* (0%-30%)], 2-Methyl-4,6-dinitrophenol [200\* (0%-30%)], Hexachlorocyclopentadiene [36\* (0%-30%)] and Pentachlorophenol [79\* (0%-30%)].

# **FID Diesel Range Organics Analysis**

# Case Narrative

**Diesel Range Organics  
Technical Case Narrative  
Haley & Aldrich, Inc. (HAAL)  
SDG #: 409254**

**Product:** Analysis of Diesel Range Organics by Flame Ionization Detector

**Analytical Method:** SW846 3541/8015C

**Analytical Procedure:** GL-OA-E-003 REV# 28

**Analytical Batch:** 1612127

**Preparation Method:** SW846 3541

**Preparation Procedure:** GL-OA-E-010 REV# 26

**Preparation Batch:** 1612126

The following samples were analyzed using the above methods and analytical procedure(s).

<b><u>GEL Sample ID#</u></b>	<b><u>Client Sample Identification</u></b>
409254040	DP060321
409254041	DP060113
409254042	DP060212
409254043	DP060212DUP
1203659992	Method Blank (MB)
1203659993	Laboratory Control Sample (LCS)
1203659994	409254040(DP060321) Matrix Spike (MS)
1203659995	409254040(DP060321) Matrix Spike Duplicate (MSD)

The samples in this SDG were analyzed on a "dry weight" basis.

**Data Summary:**

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

**Quality Control (QC) Information**

**Method Blank (MB) Statement**

The MB analyzed with this SDG met the acceptance criteria; however, the MB contained low level (below the PQL) of hydrocarbons.

**Miscellaneous Information**

**Manual Integrations**

Samples 1203659993 (LCS), 1203659994 (DP060321MS) and 1203659995 (DP060321MSD) required manual integration to correctly position the baseline as set in the calibration standard injections.

**Certification Statement**

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

## GEL LABORATORIES LLC

2040 Savage Road Charleston SC 29407 - (843) 556-8171 - www.gel.com

### Qualifier Definition Report for

HAAL002 Haley & Aldrich, Inc.

Client SDG: 409254 GEL Work Order: 409254

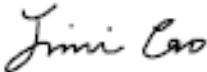

#### The Qualifiers in this report are defined as follows:

- \* A quality control analyte recovery is outside of specified acceptance criteria
- \*\* Analyte is a surrogate compound
- B The target analyte was detected in the associated blank.
- J Value is estimated
- DL Indicates that sample is diluted.
- RA Indicates that sample is re-analyzed without re-extraction.
- RE Indicates that sample is re-extracted.

#### Review/Validation

GEL requires all analytical data to be verified by a qualified data reviewer. In addition, all CLP-like deliverables receive a third level review of the fractional data package.

The following data validator verified the information presented in this data report:

Signature: 

Name: Jimin Cao

Date: 18 NOV 2016

Response Factor Report FID7

GEL Laboratories, LLC

Method File : C:\msdchem\1\DATA\110316 DRO\FID7\_DRO\_102516.m

Last Update : Tue Oct 25 14:51:13 2016

Integrator : (ChemStation Integrator)

Response via : Initial Calibration

For Linear Calibration:  $x$  = concentration ratio,  $y$  = response ratio.  $y = b + m1(x) + m2(xE2)$

b	Compound m1	m2	1	2	3	4	5		Avg	Curve	Exp	%RSD/r2
1)HA	Diesel Range Organics		1.3264409	1.6161006	1.6650818	1.7461489	1.7014884		1.6111	AVRG	E6	10.3110
2)SA	o-Terphenyl		1.6499587	1.8584381	1.9318371	2.0407463	1.9581870		1.8878	AVRG	E6	7.8442
3)B	n-Decane								0.0000	AVRG		-1.0000
4)B	n-Octacosane								0.0000	AVRG		-1.0000

(#) = Out of Range (\$) = Individual RF Out of Range ### Number of calibration levels exceeded format ###

AVRG = Average, LINR = Linear Regression,  $1/x$  = the inverse of concentration,  $1/x^2$  = the inverse square of concentration

Data Path : C:\msdchem\1\DATA\110316 DRO\  
Data File : F7K0325.D  
Signal(s) : FID1A.CH  
Acq On : 04 Nov 2016 02:15  
Operator : LXA1 InstName : FID7  
Sample : |1203659994|1612127|1|DROQ|1|MS|||  
Misc : |FIDDROC4 S|SOIL|QC A|MIX[A]||  
ALS Vial : 25 Sample Multiplier: 1

Integration File: autoint1.e  
Quant Time: Nov 04 08:23:40 2016  
Quant Method : C:\msdchem\1\DATA\110316 DRO\FID7 DRO 102516.m  
Quant Title : DRO TPH SubList :  
QLast Update : Tue Oct 25 14:51:13 2016  
Response via : Initial Calibration  
Integrator: ChemStation 6890 Scale Mode: Large solvent peaks clipped

Volume Inj. : 1 ul  
Signal Phase : DB-5MS  
Signal Info : 30m x 250um x 0.25um

Compound		Exp	R.T.	Delta	Response	Conc	Units
-----							
System Monitoring Compounds							
2) SA	o-Terphenyl	14.169	14.167	-0.002	32013867	16.958	mg/L m
Compound		Amount	Range		Recovery		
2) o-Terphenyl		20.000	No Limits		85%		
Target Compounds							
1) HA	Diesel Range Organics	Range	8.055	- 17.937	1869980575	1160.720	mg/L m
-----							

(f)=RT Delta > 1/2 Window (A) = Over the calibration range (d) = deleted (m)=manual int.
