Subject: RESPONSE TO REQUEST FOR ADDITIONAL INFORMATION FOR REVISION 25 OF THE TRUPACT-II SHIPPING PACKAGE APPLICATION, DOCKET NO. 71-9218, AND REVISION 8 OF THE HalfPACT SHIPPING PACKAGE APPLICATION, DOCKET NO. 71-9279
(EPIDS L-2021-LLA-0033 AND L-2021-LLA-0034)

References;

1. Letter from T. E. Sellmer to Document Control Desk dated February 23, 2021, subject: Revision 25 of the TRUPACT-II Shipping Package Application, Docket No. 71-9218, and Revision 8 of the HalfPACT Shipping Package Application, Docket No. 71-9279
2. Letter from T. E. Sellmer to Document Control Desk dated June 24, 2021, subject: Amendment to Revision 25 of the TRUPACT-II Shipping Package Application, Docket No. 71-9218, and Revision 8 of the HalfPACT Shipping Package Application, Docket No. 71-9279 (EPIDs L-2021-LLA-0033 AND L-2021-LLA-0034)
3. Letter from N. Garcia Santos to T. E. Sellmer dated August 11, 2021, subject: Application for the Model Nos. TRUPACT-II and HALFPACT Transport Packages – Request for Additional Information (EPIDS L-2021-LLA-0033 AND L-2021-LLA-0034)

Dear Sir or Madam:

Nuclear Waste Partnership LLC, on behalf of the U.S. Department of Energy (DOE), hereby submits an amendment to Revision 25 of the application for a Certificate of Compliance (CoC) for the TRUPACT-II Packaging, U.S. Nuclear Regulatory Commission (NRC) Docket No. 71-9218, and Revision 8 to the application for a CoC for the HalfPACT Packaging, NRC Docket No. 71-9279 (References 1 and 2). This amendment is in response to the Request for Additional Information (Reference 3) and consists of the following documents:

- TRUPACT-II Safety Analysis Report (SAR), Revision 25
- HalfPACT SAR, Revision 8
- Contact-Handled Transuranic Waste Authorized Methods for Payload Control (CH-TRAMPAC), Revision 6
- CH-TRU Payload Appendices, Revision 5.
- HPT-REP-0001, Revision 1
- SCA-CAL-0005, Revision 0

Individual responses to the RAI are provided in Attachment A. All technical changes added in response to the RAI are indicated by right-bars in the margin of the documents ("|") and are summarized in Attachment B. Right-bars in the margin of the documents ("|") indicating technical changes made to the documents in the original submittal and amendment of this application also have been retained. Revised report HPT-REP-0001 R1 and new calculation SCA-CAL-0005 R0 are provided as discussed in the Attachment A RAI responses.

This submission contains files, one or more of which contains hyperlinks to other files or to Internet websites. These hyperlinks are either inoperable or are not essential to the use of the filing. Any material referenced by hyperlinks to Internet websites that was essential for use of this filing has been submitted as part of the filing. Any material referenced by a hyperlink to another file that was essential for the use of this filing has either been included by reference or submitted as part of this filing.

To facilitate implementation, it is requested that the current package CoCs be valid for use one year from the date of issuance of the revised CoCs.

If you have any questions regarding this submittal, please contact Scott Burns of my staff at (575) 706-7920.

Sincerely,

TODD SELLMER (Affiliate)

Responses to NRC Request for Additional Information (RAI) on Revision 25 of the TRUPACT-II Safety Analysis Report (SAR), Revision 8 of the HalfPACT SAR, Revision 6 of the Contact-Handled Transuranic Waste Authorized Methods for Payload Control (CH-TRAMPAC), and Revision 5 of the CH-TRU Payload Appendices

STRUCTURAL EVALUATION (St)

RAI-St-1 Pertaining to SC-30G2, SC-30G3, SC-55G1, and SC-55G2, the application states that the SC-30G1 was previously approved based on 4-foot (4-ft) drop tests for normal conditions of transport (NCT) and 30-foot (30-ft) drop tests for hypothetical accident condition (HAC). Provide the following information:

a. Clarify whether the 4-ft drop test was conducted on the SC-55G1 version under NCT. If tests were performed, provide the test results. If the 4-ft drop test was not performed, demonstrate that the SC-55G1 shielded canister meets the 4-ft drop NCT requirement (e.g., show that the 4-ft drop test performed on other shielded canister bounds the SC-55G1 shielded canister or perform the test and provide the results).

   The report HPT-REP-0001, “Regulatory Hypothetical accident Condition Type B testing for the HalfPACT Shielded Container Payload,” Revision 0, page 2, states that 4-ft drop tests were performed for all four new versions of the shielded canisters. On page 2, the report states that the 4-ft drop test and the 30-ft drop test were conducted for the SC-30G3 and the SC-55G1 versions of the canisters for HAC, but other sections of the report (e.g., page 30) do not state that a 4-ft drop test was conducted. Similarly, the report CH-TRU on page 4.9-5 does not state that a 4-ft drop test was conducted for SC55G1.

b. Clarify whether the SC-30G2 was only tested for the 4-ft drop test. Justify why the 4-ft drop tests are an adequate means to demonstrate acceptability of the HAC 30-ft drop tests for the package with the new contents.

   It appears that in the discussion in the report HPT-REP-0001, Section 7.1.4, “SC-30G2 and SC-55G2 Evaluation,” states that the 4-ft drop test was credited to demonstrate acceptable performance of the 30-ft drop test for HAC. However, on Section 5.1.1, “SC-30G2 Payload Assembly vs. SC-55G1 Payload Assembly,” it appears to state that no testing was performed on the SC-30G2 shielded canister.

c. Clarify what is intended by the term “informally” in the report HPT-REP-0001 excerpt. If the term “informally” means that the accelerometer was not calibrated or otherwise qualified for testing, then justify why the comparison of the test results is valid.

> In the report, HPT-REP-0001Section 7.1.1, "SC-30G3 Impact Acceleration Comparison," the applicant stated that "the SC-30G3 will be used for direct comparison of 30-ft protected versus 4-ft unprotected bottom and side drops. Informally [bolded for emphasis], an information only uniaxial accelerometer was installed on SC-30G3 18TU-04 (the test unit used for Type B HAC drop testing)."

Revision 8 of the application for the HalfPACT package references report CH-TRU, "Payload Appendices", Revision 5, and the CH-TRU report references Report HPT-REP-0001. In these reports, the applicant discusses the methodology to qualify the shielded canisters included as part of the amendment request. The applicant refers in various instances to a 4-ft drop test performed for NCT (e.g., Type A tests) that is used to support the qualification of canisters. The applicant also discusses the 30-ft drop tests for HAC (e.g., Type B package tests).

The staff needs this information to determine compliance with the requirements in Title 10 of the Code of Federal Regulations Section 71.71(c) [10 CFR 71.71(c)] and 10 CFR 71.73(c).

Response:

Drop test report HPT-REP-0001, Rev. 0, submitted on February 23, 2021 as attachment 008 used to develop the RAIs has been revised to Rev. 1. The responses below where referenced (RAI-St-1 and RAI-Sh-8) are based on the updated HPT-REP-0001, Rev. 1, attached in the RAI response submittal.

As discussed in Section 1.2 of drop test report HPT-REP-0001, Rev. 1, both DOT-7A Type A 4-foot drop tests and Type B HAC 30-foot drop tests were performed for the previously approved SC-30G1. The DOT-7A Type A 4-foot free drop tests were performed to meet the requirements of 49 CFR §173.465(c). For clarification, these are 4-foot drops of bare (unprotected) shielded containers that are not inside a HalfPACT package with its protective internal dunnage, and not the requisite NCT 3-foot package drops that are performed on the TRUPACT-II and HalfPACT packages per 10 CFR §71.71(c).

a. DOT-7A Type A 4-foot bare (unprotected) free drop tests were performed on all four shielded container designs to meet the requirements of 49 CFR §173.465(c). The HPT-REP-0001 example text (pages 2 and 30) cited by RAI-St-1(a) pertains to the HAC Type B 30-foot package drops. The bare (unprotected) DOT-7A Type A 4-foot drop test results for the SC-55G1 are presented in Section 6.1.2 of HPT-REP-0001, Rev. 1.

b. The SC-30G2 and SC-55G2 were only tested for the bare (unprotected) DOT-7A Type A 4-foot drops. HAC Type B 30-foot drop tests were only performed for the SC-30G3 and SC-55G1 designs because the SC-30G3 and SC-55G1 payload assemblies, and associated packaging dunnage components, are more damaging to the ICV structure than the SC-55G2

and SC-30G2 designs, respectively. Justification for performing the HAC Type B 30-foot drop tests for these bounding designs is provided in Section 5.1 of HPT-REP-0001. For convenience, Table 1 summarizes the tested configurations for the four shielded container designs, and has been added to Section 1.2 of HPT-REP-0001, Rev. 1, for clarity.

Table 1 – Summary of Shielded Container Type A and Type B Testing

Drop Test	Shielded Container Test Unit 18-TUXX[1]			
	SC-30G2	SC-30G3	SC-55G1	SC-55G2
Type A – 4' CG Over Corner	01	03	06	09
Type A – 4' Flat Bottom End	01	03	—	09
Type A – 4' Near-Vertical Lid	02	05	06	10
Type A – 4' Flat Side	02	05	—	10
Type B – 30' Flat Bottom End	—	04	07 & 08	—
Type B – 30' Flat Side	—	04	07 & 08	—

1. "XX" defines the test unit number, e.g., 18-TU01, 18-TU02, etc.

The basis for acceptance of the SC-30G2 and SC-55G2 designs is that physical damage to shielded containers caused by the DOT-7A Type A 4-foot bare drop tests is worse than physical damage to shielded containers caused by HAC Type B 30-foot protected (by foam-filled dunnage) drop tests within the HalfPACT package assembly. Comparison of physical damage to the tested shielded containers from the original SC-30G1 tests as well from the new SC-30G3 and SC-55G1 tests validate this assertion. Therefore, demonstrating that the SC-30G2 and SC-55G2 designs successfully passed the bounding DOT-7A Type A 4-foot drop tests of bare shielded containers ensures that they would also pass the HAC Type B 30-foot drop tests of protected shielded containers within the HalfPACT package. The HAC Type B 30-foot drops demonstrated that the foam-filled dunnage within the bounding payload assembly configurations protected the ICV from internal damage due to the shielded containers.

c. The term "informally" was intended to denote the use of a currently uncertified accelerometer (i.e., the accelerometer's certification was expired, and certifying agencies were not available last summer due to COVID-19 closures). The data collected from the use of the uniaxial accelerometer is not the basis for regulatory compliance. The accelerometer data provides additional evidence that corroborates the documented post-test inspections confirming there was no loss of confinement of fluorescein dye from the payloads and the visual comparison of physical damage to shielded containers subject to bare DOT-7A Type A 4-foot drops and those subject to dunnage-protected HAC 30-foot drops. Section 7.0 of HPT-REP-0001, Rev. 1, has been revised to clarify the use of this information. Accelerometer data supports

what was observed from drop testing, i.e., that bare 4-foot drops were more damaging to the shielded containers than dunnage-protected 30-foot drops.

SHIELDING EVALUATION (Sh)

RAI-Sh-1 Clarify, with justifications, how the uncertainties in the source intensity, source term geometric distribution, and the density correction factors (DFCs) were considered in the calculations of the dose rates and revise the allowable contents as necessary to meet the dose rate limits.

Sections 5.5.6, 5.5.7, 5.5.8, and 5.5.9 of Revision 25 of the TRUPACT-II application provide information on the allowable source intensity, source term geometric distribution, and the DFCs. However, it is not clear whether the uncertainties in these parameters have been considered in determining the maximum allowable activity for each of the containers with the targeted dose rate limit.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.47.

Response:

All calculations used to determine activity limits and density correction factors (DCF) are based on an adjusted dose rate (D_a) that is equal to the Monte Carlo N-Particle (MCNP) calculated dose rate (D_c) plus the tally error (E), i.e., one standard deviation, as follows:

$$D_a = D_c(1+E)$$

To account for uncertainties in the payload activity assay evaluation, Section 3.3.1.1 of the *Contact-Handled Transuranic Waste Authorized Methods for Payload Control* (CH-TRAMPAC) includes the following requirement:

> "Each payload shall be acceptable for shipment only if the determined activity plus the error (i.e., one standard deviation) meets the specific limit as determined by the procedure provided in Section 5.5.10 of the TRUPACT-II SAR."

With reference to Section 5.5.10 of the TRUPACT-II SAR, the default payload configuration from a shielding standpoint conservatively assumes a point source. If, however, a waste form can be shown to meet the requirements for "distributed throughout" from NUREG-1608, then the activity limits for the distributed source model, in conjunction with the appropriate DCF for gamma-emitting radionuclides, may be used; neutron bearing wastes do not utilize a DCF for distributed source models. Uncertainties in the calculated DCFs were considered by conservatively implementing a DCF curve-fit utilizing the minimum DCFs calculated over a range of gamma energies as a function of

source density that utilizes zirconium as a conservative basis for self-shielding material in the distributed source region.

To account for other uncertainties in source intensity and/or source term geometric distribution, Section 5.5.10 of the TRUPACT-II SAR and correspondingly Section 3.3.2.1 of the CH-TRAMPAC apply a 10% administrative margin to the calculated activity limit, where the combined sum of partial fractions for the gamma and neutron source terms present in the package must be less than or equal to 0.9.

RAI-Sh-2 Provide the maximum size of the solid-large objects, for each of the categories of the contents as specified in “Contact-Handled Transuranic Waste Authorized

Methods for Payload Control” (CH-TRAMPAC) (ADAMS Accession No. ML21054A054) Revision 6, (ADAMS Accession No. ML21054A054) and clarify which shielding analyses supports the large objects.

CH-TRAMPAC, Revision 6, Table 2.9-49, Table 2.9-53, Table 2.9-57, and Table 2.9-61 identifies three forms of authorized contents for the SC-30G2, SC-55G1, and SC-55G1 containers. The three forms include the following:

1. solids, any particle size (e.g., fine powder or inorganic particulates),

2. large particle size (e.g., sand, concrete, or debris), and

3. large objects (e.g., metal cans containing waste).

However, it is not clear how to distinguish what constitutes a large object and particle of any size. Also, it is not clear how these definitions of the sizes of the particles or objects are related to the shielding models of distributed or concentrated sources in the package.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.33(b)(3), 10 CFR 71.47, and 10 CFR 71.51.

Response:

Table 2.9-41, Table 2.9-49, Table 2.9-53, Table 2.9-57, and Table 2.9-61 of the CH-TRAMPAC identify material content forms authorized for transport within each of the five shielded container designs (i.e., the currently licensed SC-30G1, and the new SC-30G2, SC-30G3, SC-55G1, and SC-55G2, respectively). Each waste form must be accordingly loaded within a 30-gallon or 55-gallon waste drum.

The term “particle size” is used comparatively in CH-TRAMPAC Section 2.9 to broadly differentiate physical forms as powder/particulate (as present in sludge or solidified waste) or debris; it is not quantitative. The first waste form, “solids, any particle size,” generically refers to relatively uniform solid waste material such as fine powders, ash, oxides, and cements. The second

waste form, “large particle size,” generically refers to non-uniform waste material such as sands, concrete, and random-sized debris. Finally, the third waste form, “large objects,” generically refers to waste material packed within inner metal containers, and may be as large as the 30-gallon or 55-gallon waste drum’s cavity allows. However, as shown in the subsequent paragraph, the precise waste form is generally unimportant from a shielding evaluation standpoint.

Material content forms from Section 2.9 of CH-TRAMPAC are not used in the determination of source term distribution or related in any way to shielding model inputs.

With reference to Section 5.5.10 of the TRUPACT-II SAR, the default payload configuration from a shielding standpoint conservatively assumes a point source; thus, the physical waste form becomes unimportant because source self-shielding is not relevant for gamma-emitting radionuclides, and the container materials of construction make them essentially transparent to neutron-emitting radionuclides. If a payload of containers can be shown to meet the requirements for “distributed throughout” from NUREG-1608, then the activity limits for the distributed source model, in conjunction with the appropriate density correction factor (DCF) for gamma-emitting radionuclides, may be used.

RAI-Sh-3 Explain why the density correction factors (DCFs) for SC-30G3 and SC-55G1 are identical.

The application shows that the equations for the self-shielding factor DCFs of the SC-30G3 and SC-55G1 are identical. Specifically, the application presents these polynomial equations as:

$$DCF_{SC\text{-}30G3} = 0.0051*\rho^3 - 0.0987*\rho^2 + 0.8030*\rho + 0.2342,$$

$$DCF_{SC\text{-}55G1} = 0.0051*\rho^3 - 0.0987*\rho^2 + 0.8030*\rho + 0.2342$$

However, it is not clear why they behave the same since these two containers have different shielding designs and source term limits as shown in Tables 5.5-18 to 5.5-21.

The staff needs this information to determine compliance with the requirements of 10 CFR 71.47 and 10 CFR 71.51.

Response:

As identified by RAI-Sh-3, the DCF equation for the SC-55G1 was incorrect in the application. Section 5.5.8 of the TRUPACT-II SAR has been revised to present the following corrected DCF equation for the SC-55G1.

$$DCF_{SC\text{-}55G1} = 0.0024*\rho^3 - 0.0668*\rho^2 + 0.7557*\rho + 0.2630$$

RAI-Sh-4 Add the steps listed in Section 5.5.10 to the Chapter 7 of the safety analysis report (SAR) as part of the instructions for determining the allowable contents.

Section 5.5.10, "Determination of Acceptable Activity," of the TRUPACT-II SAR provides a list of the steps for determining the allowable quantity of the wastes based on their radioactive characteristics. These steps/instructions form the basis for determining the maximum allowable contents and should be part of the loading instructions.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.33(b)(1), 10 CFR 71.43(f), 10 CFR 71.47, 10 CFR 71.51, and 10 CFR 71.87(a).

Response:

The TRUPACT-II and HalfPACT Certificates of Compliance as well as Section 7.1.4 of the TRUPACT-II and HalfPACT SARs specify the use of the *Contact-Handled Transuranic Waste Authorized Methods for Payload Control* (CH-TRAMPAC) for determining allowable contents. Section 3.3.1.1 of the CH-TRAMPAC includes the following requirement:

> "Each payload shall be acceptable for shipment only if the determined activity plus the error (i.e., one standard deviation) meets the specific limit as determined by the procedure provided in Section 5.5.10 of the TRUPACT-II SAR."

Chapter 7 of the TRUPACT-II and HalfPACT SARs – the procedural instructions for operational loading of a payload assembly into a packaging – specifies that a payload configuration has been properly prepared per the requirements of CH-TRAMPAC. Prior to assembling a payload for loading into a package, Section 6.2.2 of CH-TRAMPAC requires a Transportation Certification Official to comply with Section 3.3 of CH-TRAMPAC. As discussed above, Section 3.3.1.1 of CH-TRAMPAC requires compliance determination as described in Section 5.5.10 of the TRUPACT-II SAR. Therefore, the steps listed in Section 5.5.10 of the TRUPACT-II SAR are included in Chapter 7 of the SARs because Chapter 7 requires compliance with CH-TRAMPAC.

RAI-Sh-5 Demonstrate there are no significant secondary gammas or neutrons from the package or provide control measures to ensure that there will be no significant (n, gamma) or (gamma, n) reactions in the TRU wastes.

Page 5.3-27 of the TRUPACT-II application states the following:

> "Combined photon/neutron mode evaluations were not employed for the neutron analyses as multiple test runs demonstrated that the gamma dose rate due to the interaction of neutrons in the shielding materials contributes a statistically insignificant (<1%) change in the dose rate as compared to the neutron dose rate."

However, it is not clear what the multiple runs were referred to. If the term "run" is related to the MCNP model calculation, the secondary gammas or neutrons in the TRU contents would not be captured in the analyses because the definition of the material in the sample MCNP input, as provided in the application, for the content does not include the TRU isotopes as defined in the Department of Energy's Environmental Impact Statements (DOE 2016). The (n, gamma) and (gamma, n) reactions in the TRU wastes are well understood physical phenomena (McNair, 2019). The MCNP models can only capture the secondary gamma and neutrons when the material compositions for the TRU contents are explicitly defined in the material cards.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.47 and 10 CFR 71.51.

References:

2. Carson R McNair, "Characterization techniques for TRU waste from the Analytical Laboratory Hot Cells at Idaho National Laboratory," Idaho National Laboratory, March 2019.

Response:

As correctly stated in RAI-Sh-5, the determination that secondary gamma production from neutrons is statistically insignificant relates only to neutron interaction with the materials of construction for the shielded containers proper. It is asserted that any dose rate increases due to secondary gamma production from neutron interaction with waste material contents is concurrently associated with a more dominant effect of neutron attenuation due to self-shielding (which is not credited for neutrons in either concentrated or distributed waste form activity limits). This assertion was again tested and affirmed via a supplemental series of calculations described below.

To increase neutron capture and corresponding secondary gamma production, the entire shielded container payload cavity was filled with polyethylene with a density of 0.94 g/cc. The SC-30G3 and SC-55G1, which are associated with the greatest and least gamma shielding, respectively, were modeled to encompass the four new shielded container designs.

Two MCNP analyses were run for the SC-30G3 and for the SC-55G1, i.e., NCT and HAC with a concentrated ^{252}Cf neutron source. With the exception of placing polyethylene in the payload cavities and adding photon measurement for the tally regions, the MCNP models are identical to those used to develop Tables 5.4-13 (SC-30G3) and 5.4-14 (SC-55G1) of the TRUPACT-II SAR. For

completeness, the MCNP output files for the four runs are provided in Attachment RAI-Sh-5, and summarized below in Tables 2 and 3 below.

Self-shielding plays a major role in reducing dose rates such that the activity limits calculated in Tables 2 and 3 are significantly greater than the activity limits determined in Tables 5.4-13 and 5.4-14 of the TRUPACT-II SAR for the SC-30G3 and SC-55G1, respectively. Thus, the presence of a material within the shielded container's payload cavity that could stimulate secondary gamma production also serves to provide self-shielding for the neutron source. In summary, accounting for waste material from a neutron to secondary gamma production perspective results in far less restrictive activity limits than what is presented in the SAR.

Table 2 – SC-30G3 NCT & HAC Activity Limits with a Polyethylene Payload

Particle Type	Source Strength (par/s/Ci)	Calculated Dose Rate (mrem/hr / par/s)	Tally Error	Adjusted Dose Rate (mrem/hr / par/s)	Percent of Total Dose Rate	Allowable Dose Rate (mrem/hr)	Allowable Activity (n/s)	Activity Limit (Ci)

RAI-Sh-6 Clarify whether the uncertainties associated with the source term calculation and the statistical uncertainty associated with the dose rate calculation have been included in the final dose rates. If they are not, include the uncertainties associated with these calculations and demonstrate that the package meets the regulatory requirements.

The applicant used computer code SOURCES-4A to calculate the specific activity of each of the nuclides provided in the document CH-TRAMPAC. However, it is not clear what are the uncertainties, if any, associated with the source term calculations of the transuranic wastes using the SOURCES-4A computer code. The uncertainties of the source term calculations should include, as a minimum, how the transuranic wastes were produced, i.e., irradiation parameters, such as fluxes and spectra, cooling time, and the uncertainties of these parameters.

The applicant developed a scheme to calculate the allowable activity for the SC-30G1 and the four new containers. The scheme determines the maximum allowable contents by dividing the targeted dose rate by the calculated dose rate per curie of each nuclide in the wastes. Table 5.1-8 to Table 5.1-11 of Revision 25 of the TRUPACT-II application provide the targeted maximum dose rates for the Half-PACT packaging system containing the payloads for the four new containers (SC-30G2, SC-30G3, SC-55G1, and SC-55G2) and Table 5.1-7 provides the revised neutron dose rate for neutron sources for the SC-30G1 container. The dose rates in these tables show that the maximum dose rate is less than one percent (e.g., 9.99 mrem/hr vs. 10 mrem/hr for the SC-30G2 container) within the regulatory limits of 10 CFR 71.47, which is 10 mrem/hr. In addition, the data provided in Table 5.4-12, Table 5.4-13, Table 5.4-14, and Table 5.4-15 show that the statistical errors of the Monte Carlo method used in the shielding analyses are in 0.1% to 0.3% for packages under NCT. Based on the MCNP manual, the error associated tally of MCNP calculation is a percentage of the mean value, thus, 0.3% * 9.99 = 0.02997. Considering the statistical error, the actual dose rate could be as high as 9.99+0.02997=10.01997 mrem/hr, which exceeds the regulatory dose rate limit of 10 mrem/hr.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.47.

Response:

The response to RAI-Sh-1 addresses uncertainties associated with source term calculation and the statistical uncertainty associated with the dose rate calculations that are used to determine activity limits.

Per Section 5.2.2 of the TRUPACT-II SAR, the SOURCES-4A computer code was used to generate the neutron source energy spectrum that was used for neutron shielding calculations, and not the specific activities of radionuclides; specific activities are taken from Table 3.1-2 of the CH-TRAMPAC.

As stated earlier, all MCNP shielding calculation results that are used to determine activity limits and density correction factors are based on an adjusted dose rate (D_a) that is equal to the calculated dose rate (D_c) plus the tally error (E), i.e., one standard deviation, as follows:

$$D_a = D_c(1+E)$$

Thus, the tally error is already taken into account for developing the activity limits and is not additive to the dose rates provided in Tables 5.1-8 through 5.1-11 of the TRUPACT-II SAR.

RAI-Sh-7 Justify the assumption for maximizing the distance to the detector for the shielding model for the package under NCT.

On page 5.3-1, the first paragraph the TRUPACT-II SAR states the following:

> "NCT assumptions maximize the distance from the source(s) to the nearest detector whereas HAC assumptions minimize the distance from the source(s) to the nearest detector."

The staff understands the assumption for modeling of the package under HAC. However, it does not understand why the applicant tried to maximize the distance between the source and the detector in the NCT model. This assumption may not be conservative even if the source is homogeneously distributed in the waste.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.47.

Response:

To maximize the distance from the source to the shielded container's surface in all radial directions, the source is located at the shielded container's axial centerline. Given the nature of CH-TRU waste, the expected distribution of waste is such that the average source activity occurs near the center of the payload container. Any potential deviation from its center is captured within the 10% administrative margin that is used to restrict activity limits.

A response to a similar RAI was provided in March 2013 (Letter from T.E. Sellmer to Document Control Desk, dated March 27, 2013, subject: Response to Second Request for Additional Information for Revision 23 of the TRUPACT-II Shipping Package Application, Docket No. 71-9218, TAC No. L24643, and Revision 6 of the HalfPACT Shipping Package Application, Docket NO. 71-9279, TAC NO. L24642). Since the same approved methodology is being implemented for the four new shielded container designs, the previous RAI 5.1 response is still valid.

The calculated allowable activity is administratively reduced 10% to address the potential for reconfiguration of source material within shielded containers

under NCT where the combined sum of partial fractions for gamma and neutron source terms are required to be less than or equal to 0.9. As shown below, potential reconfiguration of the source material in the shielded containers under NCT is highly improbable and will not cause a significant change in the limiting package dose rate values. Other potential sources of dose rate increase under NCT are not applicable for shielded containers due to test results indicating no damage to the payload container under those conditions.

DOE TRU waste packaging guidance and site-specific waste acceptance criteria direct the preparation of CH-TRU waste payload containers to ensure safe and compliant ALARA payload container dose rates during characterization activities, intra-site transport operations, generator site storage, Type B package loading and transport processes, and WIPP repository disposal sequences. By definition, a CH-TRU waste payload container surface dose rate cannot exceed 200 mrem/hr. The CH-TRAMPAC and the WIPP Land Withdrawal Act (Public Law 102-579) impose this payload container surface dose rate requirement. The absence of CH-TRU payload containers exceeding the payload container surface dose rate requirement when surveyed after receipt at WIPP is a strong indicator that dose rate changes during handling and shipment, even at the payload container level, are insignificant. This indicator is important because any change in the payload container surface dose rate translates into a much smaller corresponding change in the limiting 2-meter package dose rate.

Using distance attenuation for the SC-55G1 configuration as an example, where the dose rate is directly proportional to the inverse square of the distance, the limiting dose rate of 10 mrem/hr at a distance 2 meters from the HalfPACT package surface containing two SC-55G1s with initially centered point sources that are unrealistically moved the full radial distance to the SC-55G1's inner shell surface would only increase to $(126.781/114.281)^2 \times 10 = 12.3$ mrem/hr (see Figure 1). Similarly, the limiting dose rate of 10 mrem/hr at a distance 2 meters from the HalfPACT package surface containing one SC-55G2 with an initially centered point source that is unrealistically moved the full radial distance to the SC-55G2's inner shell surface would only increase to $(125.928/113.448)^2 \times 10 = 12.3$ mrem/hr (see Figure 2).

Any substantial concentration of sources resulting from movement during transport would be readily observable during receipt inspection of the package, and none has been noted in thousands of CH-TRU waste shipments within the TRUPACT-II and HalfPACT packages.

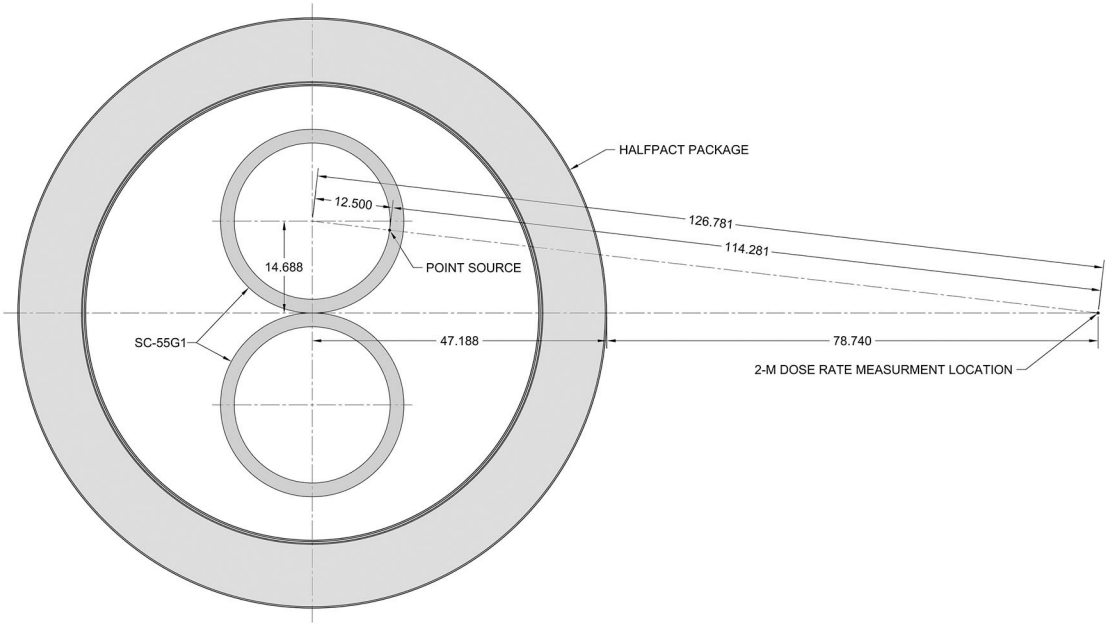

FIGURE 1 – HalfPACT Package with Two SC-55G1s; Shifted Point Source

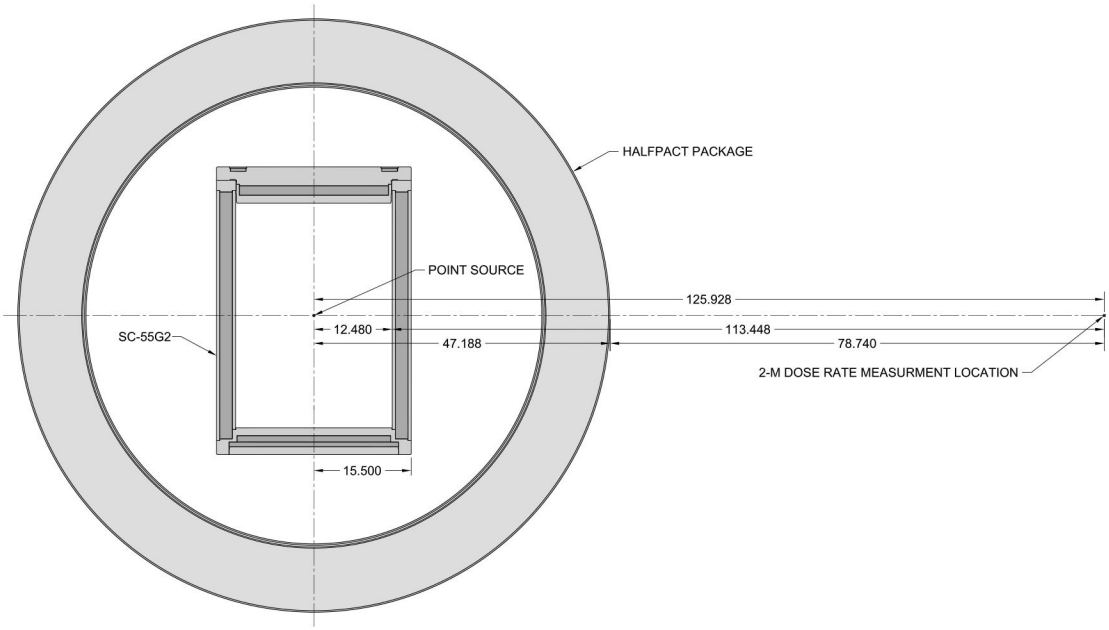

FIGURE 2 – HalfPACT Package with One SC-55G2; Shifted Point Source

Regardless, the occurrence of shielded containers having initially centered sources with full source reconfiguration to the worst possible location under NCT is not considered a credible scenario. Given the nature of CH-TRU waste, the expected distribution of waste is such that the average source activity occurs near the center of the payload container. Any potential deviation from its center is captured within the 10% administrative margin that is used to restrict activity limits.

RAI-Sh-8 Either demonstrate that lead slump does not occur or provide an analysis of the effect of lead slump on the dose rate at one meter for the damaged package.

In the document titled “CH-TRU Payload Appendices,” Revision 5, the applicant stated in the application that no lead slump occurred by examining the lead layer of the testing unit. However, staff does not find the justification for not evaluating lead slump in the application. The staff notes that lead slump under impact is an unavoidable natural phenomenon and will occur in accordance with the basic physics (G. C. Mok, 1989, Tan, et al, 2017) unless the package is designed such that the shielded containers inside the overpack do not experience any significant impact (g-load) under the drop tests required in 10 CFR 71.73(c)(1), which states the following:

> “Free Drop. A free drop of the specimen through a distance of 9 m (30 ft) onto a flat, essentially unyielding, horizontal surface, striking the surface in a position for which maximum damage is expected.”

The staff notes that Figure 4.10-18 – SC-55G2 18TU-10 Cut AM-AN Near Mid-Span shows visible deformation of the lead layer in the middle section of the test unit. The staff also notes that the picture in Figure 7-20 of the document, with document identification number “HPT-REP-0001,” seems to show a void gap at the top end of the lead shield after drop test. These gaps are probable evidence that there will be a loss of lead shield resulting from lead slump. In fact, the gap created by lead slump can be calculated by the differential contraction of the lead layer and the steel shells. If there is not sufficient data to prove lead slump will never occur for this package under HAC, a shielding analysis should be provided assuming there is lead slump under HAC, as predicted using the method in the “Cask Designers Guide” (ORNL, 1970) document. The analysis should also account for any void between the top of the lead shielding and the outer cask top flange resulting from package fabrication. Using analyses for a few radionuclide contents (e.g., Co-60), the applicant may demonstrate that the dose rates for the puncture HAC configuration bound those for the lead slump configuration. In addition, the publication from Sandia National Laboratory, “Dose Estimates in a Loss of Lead Shielding Truck Accident,” clearly indicate that lead slump is a credible condition for transportation package under HAC.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.51.

Response:

With reference to Figure 7-43 in drop test report HPT-REP-0001, Rev. 1 (Figure 4.10-18 in CH-TRU Payload Appendices), the last paragraph of Section 7.1.3.2 clarifies that the visible deformation at mid-length of SC-55G2 18TU-10 occurred because of a side drop strike on the test rigging’s lifting shackle, not because of lead slump. Therefore, the damage shown in Figure 7-43 at mid-length and Figure 7-34 (not Figure 7-20) at the upper flange end are unrelated.

Axial voids at the ends of the sidewall lead column are shown in HPT-REP-0001, Rev. 1, Figures 6-51 and 6-53 for SC-30G3 18TU-04 that was used for 30-foot HAC drop testing in two orientations (a flat end drop and a flat side drop); Figures 7-18, 7-20, and 7-23 for SC-30G2 18TU-02 that was used for 4-foot Type A drop testing in two orientations (a 10º near-vertical top-down drop and horizontal side drop); and Figure 7-34 for SC-55G2 18TU-09 that was used for bare (unprotected) 4-foot Type A drop testing in two orientations (a center-of-gravity over bottom corner drop and a bottom-down vertical end drop). All axial voids are identified as “cold-shuts” that occurred during the lead pour process. The reasons for this conclusion are summarized below:

1. SC-30G3 18TU-04: The axial void depicted in Figures 6-51 and 6-53 only occurred at the upper step; no void occurred at the lower step. If lead slump had occurred, a void would have been present at both upper and lower steps.

2. SC-30G2 18TU-02: The axial void depicted in Figures 7-18, 7-20, and 7-23 occurred on the second SC-30G2 test unit that was subjected to a 10º near-vertical top-down drop and horizontal side drop. In comparison, SC-30G2 18TU-01 that was subjected to a flat end drop and center-of-gravity-over-corner drop showed no axial void at either end (see Figures 7-13 through 7-16). If lead slump had occurred, SC-30G2 18TU-01 would have exhibited an axial void greater than that observed in SC-30G2 18TU-02.

3. SC-55G2 18TU-09: The axial void depicted in Figure 7-34 occurred on the first SC-55G2 test unit that was subjected to a center-of-gravity over bottom corner drop followed by a flat end drop. The flat end drop should have produced an axisymmetric axial void, yet Figure 7-36 at a cut position 180º from the void shown in Figure 7-34 shows no evidence of lead movement.

Considering all test units, both Type B and Type A, the maximum measured axial void that occurred due to "cold-shuts" was 0.318 inches observed in SC-55G2 18TU-09. To address the effect of axial voids, the SC-30G2, SC-30G3, and SC-55G2 shielding models were modified to include an identical axial gap at both ends of the sidewall lead column; stepped ends included the gap at both steps. This evaluation is included in SCA-CAL-0005, *Effect of Axial Gaps in the SC-30G2, SC30G3, and SC-55G2 Lead Sidewalls* and the results are summarized in new Section 5.4.5, *Evaluation for Axial Gaps in the Sidewall Lead*, of the TRUPACT-II SAR. These models were evaluated for both NCT and HAC.

This evaluation demonstrated that axial gaps as great as 1/2-inch at either the upper or lower end of the sidewall lead column result in a maximum NCT dose rate increase of only 1.01× and a maximum HAC dose rate increase of 1.17×, both associated with the SC-30G2 design (see Table 5.4-16 of the TRUPACT-II SAR). Table 5.4-12 of the TRUPACT-II SAR for the SC-30G2 shows that the HAC activity limit is 9.73× greater than the NCT activity limit. Similarly, Tables 5-4-13 and 5.4-15 of the TRUPACT-II SAR show HAC and NCT activity limit ratios of 3.35× and 4.10× for the SC-30G3 and SC-55G2 designs, respectively. Therefore, the reported increases in HAC dose rates due to 1/2-inch axial gaps are inconsequential because the NCT 2-meter dose rate bounds the activity limits for all shielded container designs.

RAI-Sh-9 Show that the MCNP gamma shielding analysis model for the HalfPACT containing the SC-30G3 container properly converged.

The applicant provided the input file for the MCNP model for the HalfPACT containing the SC-30G3 container. The input model indicates that the applicant set a cut-off computing time of 1200 minutes. However, it is not clear how this cut-off time was determined and whether it can assure a proper convergence of the calculations. One method of showing convergence is providing an output file for the package under NCT. Also, clarify whether the calculations were made on a multiprocessor computer cluster or single processor. For the CTME card, the MCNP 6.2 user's manual (LA-UR-17-29981, Los Alamos National Laboratory, 2017) explicitly points out that it is highly recommended that the NPS card (Section 3.3.7.1.1) should be used to limit the run time for multiprocessor cluster computers.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.47 and 10 CFR 71.51(a)(2).

Response:

While convergence may be used to terminate MCNP calculations for a criticality analysis, it is not applicable for a shielding analysis. A shielding evaluation relies on the results of MCNP's ten statistical checks for determining a problem's validity. A user's model can attain a solution from MCNP that can pass all ten statistical checks, yet have a high tally error (i.e., statistical uncertainty) because a low number of particle histories were evaluated. To reduce the tally error, the user must run a greater number of particle histories, but doing so increases the probability that one or more poorly-behaved particles will cause one or more of the ten statistical checks to fail.

An MCNP run is terminated based on one of two possible methods: 1) controlling computer processor time using the CTME card, or 2) controlling total quantity of particles using the NPS card. Because LANL never corrected MCNP when multi-threading was implemented, computer processor time is semi-arbitrary when running a multi-threading evaluation; hence, the reason the NPS card is recommended, but not required, for use in that situation. Regardless of the method employed to perform an MCNP evaluation and determine the run's cut-off point, however, it is still the responsibility of the user to evaluate results carefully to determine whether sufficient particles have been evaluated to produce an accurate solution.

Although the CTME card was employed for all runs, and all runs were performed using a multi-threading computer, the evaluation goal was to run for sufficient time (i.e., number of particles) to achieve a tally error under one percent. For the SC-30G3 example given, time was increased to 1,200 minutes using a trial-and-error process until the ≤1% tally error goal was achieved. As such, running with the NPS card would not have changed the reported results because the value on the NPS card would have been increased until the same answer with the same tally error goal was achieved.

RAI-Sh-10 Confirm that pre-shipment radiation survey is not relied upon for demonstrating that the package design will meet the regulatory requirement of 10 CFR 71.51(a)(1) and revise the SAR as necessary.

On page 5.3-1, the first paragraph the TRUPACT-II SAR states:

"Any significant deviation from the NCT configuration assumption is precluded through the use of pre-shipment radiological surveys of the package to validate that the source(s) are reasonably distributed within the package."

This statement seems to indicate that assurance of compliance with the regulatory requirement of 10 CFR 71.51(a)(1), "…, no significant increase in external surface radiation levels, and no substantial reduction in the effectiveness of the packaging;.." relies on pre-shipment dose rate measurement. It is not clear how this pre-shipment measurement can assure that the package meets the regulatory requirements of no significant increase

in external surface radiation levels even before a shipment has been made. A pre-shipment dose rate measurement can only assure that the package is fabricated and loaded as designed. It cannot tell any information on the potential source terms reconfiguration or relocation under NCT. Only design analysis can provide such an assurance.

In addition, as explained in Regulatory Issue Summary 2013-04, “Content Specification and Shielding Evaluations for Type B Transportation Packages,” pre-shipment dose rate measurement is a requirement of 10 CFR 71.87, “Routine determinations.” Per 10 CFR 71.35(a), an application for a CoC must include a demonstration that the package satisfies the standards in Subpart E which includes requirements in 10 CFR 71.51.

The staff needs this information to determine compliance with the requirements in 10 CFR 71.35 and 10 CFR 71.51.

Response:

For clarity, Section 5.3.1 of the TRUPACT-II SAR has been revised to delete the last two sentences.

Assurance that the NCT regulatory requirement of 10 CFR §71.51(a)(1) has been met is accomplished via the shielding analyses presented in Chapter 5 of the TRUPACT-II SAR. The responses to RAI-Sh-1 and RAI-Sh-6 address uncertainties in the payload activity assay evaluation. The 10% administrative margin that is applied to the calculated activity limit, where the combined sum of partial fractions for the gamma and neutron source terms present in the package must be less than or equal to 0.9, accounts for all other uncertainties.

 ============================================================================================================================

 this tally meets the statistical criteria used to form confidence intervals: check the tally fluctuation chart to verify.
 the results in other bins associated with this tally may not meet these statistical criteria.

 ----- estimated confidence intervals:  -----

 estimated asymmetric confidence interval(1,2,3 sigma): 5.6373E-09 to 5.7301E-09; 5.5909E-09 to 5.7766E-09; 5.5444E-09 to 5.8230E-09
 estimated  symmetric confidence interval(1,2,3 sigma): 5.6367E-09 to 5.7295E-09; 5.5902E-09 to 5.7759E-09; 5.5438E-09 to 5.8224E-09

1analysis of the results in the tally fluctuation chart bin (tfc) for tally 4 with nps = 171447570          print table 160

 normed average tally per history  = 5.68309E-09         unnormed average tally per history  = 2.16642E-06
 estimated tally relative error    = 0.0082              estimated variance of the variance  = 0.0017
 relative error from zero tallies  = 0.0051              relative error from nonzero scores  = 0.0064

 number of nonzero history tallies =       39087         efficiency for the nonzero tallies  = 0.0002
 history number of largest  tally  =    47078243         largest  unnormalized history tally = 3.73827E-01
 (largest  tally)/(average tally)  = 1.72556E+05         (largest  tally)/(avg nonzero tally)= 3.93396E+01

 (confidence interval shift)/mean  = 0.0001              shifted confidence interval center  = 5.68371E-09

 if the largest  history score sampled so far were to occur on the next history, the tfc bin quantities would change as follows:

      estimated quantities          value at nps          value at nps+1          value(nps+1)/value(nps)-1.

      mean                           5.68309E-09           5.68881E-09                  0.001006
      relative error                 8.16920E-03           8.22268E-03                  0.006548
      variance of the variance       1.70279E-03           1.87581E-03                  0.101605
      shifted center                 5.68371E-09           5.68375E-09                  0.000006
      figure of merit                1.24775E+01           1.23157E+01                 -0.012968

 the estimated inverse power slope of the 200 largest  tallies starting at 6.41056E-02 is 6.2335
 the large score tail of the empirical history score probability density function appears to have no unsampled regions.

 fom = (histories/minute)*(f(x) signal-to-noise ratio)**2 = (1.428E+05)*( 9.349E-03)**2 = (1.428E+05)*(8.740E-05) = 1.248E+01

results of 10 statistical checks for the estimated answer for the tally fluctuation chart (tfc) bin of tally 4

tfc bin behavior	--mean-- behavior	---------relative error--------- value	decrease	decrease rate	----variance of the variance---- value	decrease	decrease rate	--figure of merit-- value	behavior	-pdf- slope
desired	random	<0.10	yes	1/sqrt(nps)	<0.10	yes	1/nps	constant	random	>3.00
observed	random	0.00	yes	yes	0.00	yes	yes	constant	random	1.62
passed?	yes	yes	yes	yes	yes	yes	yes	yes	yes	no

warning. the tally in the tally fluctuation chart bin did not pass 1 of the 10 statistical checks.

1analysis of the results in the tally fluctuation chart bin (tfc) for tally 4 with nps = 2033074578 print table 160

normed average tally per history = 5.54561E-07 unnormed average tally per history = 1.12400E-06
estimated tally relative error = 0.0023 estimated variance of the variance = 0.0000
relative error from zero tallies = 0.0019 relative error from nonzero scores = 0.0012

number of nonzero history tallies = 271243 efficiency for the nonzero tallies = 0.0001
history number of largest tally = 1091724254 largest unnormalized history tally = 2.17149E-02
(largest tally)/(average tally) = 1.93193E+04 (largest tally)/(avg nonzero tally)= 2.57749E+00

(confidence interval shift)/mean = 0.0000 shifted confidence interval center = 5.54562E-07

if the largest history score sampled so far were to occur on the next history, the tfc bin quantities would change as follows:

estimated quantities	value at nps	value at nps+1	value(nps+1)/value(nps)-1.
mean	5.54561E-07	5.54566E-07	0.000010
relative error	2.28417E-03	2.28417E-03	-0.000001
variance of the variance	6.03118E-06	6.03127E-06	0.000015
shifted center	5.54562E-07	5.54562E-07	0.000000
figure of merit	1.99648E+01	1.99648E+01	0.000002

the estimated inverse power slope of the 19 largest tallies starting at 2.11742E-02 is 1.6174
the empirical history score probability density function appears to be increasing at the largest history scores:
please examine. see print table 161.
the large score tail of the empirical history score probability density function appears to have no unsampled regions.

fom = (histories/minute)*(f(x) signal-to-noise ratio)**2 = (2.118E+05)*(9.709E-03)**2 = (2.118E+05)*(9.427E-05) = 1.996E+01

1unnormed tally density for tally 4 nonzero tally mean(m) = 8.425E-03 nps = 2033074578 print table 161

 ============================================================================================================================

 this tally meets the statistical criteria used to form confidence intervals: check the tally fluctuation chart to verify.
 the results in other bins associated with this tally may not meet these statistical criteria.

 ----- estimated confidence intervals:  -----

 estimated asymmetric confidence interval(1,2,3 sigma): 1.8599E-10 to 1.8707E-10; 1.8545E-10 to 1.8761E-10; 1.8491E-10 to 1.8815E-10
 estimated  symmetric confidence interval(1,2,3 sigma): 1.8599E-10 to 1.8707E-10; 1.8545E-10 to 1.8761E-10; 1.8491E-10 to 1.8815E-10

1analysis of the results in the tally fluctuation chart bin (tfc) for tally 34 with nps = 179610771          print table 160

 normed average tally per history  = 1.86527E-10          unnormed average tally per history  = 1.90179E-07
 estimated tally relative error    = 0.0029               estimated variance of the variance  = 0.0000
 relative error from zero tallies  = 0.0025               relative error from nonzero scores  = 0.0015

 number of nonzero history tallies =      160703          efficiency for the nonzero tallies  = 0.0009
 history number of largest  tally  =   177982641          largest  unnormalized history tally = 1.80858E-03
 (largest  tally)/(average tally)  = 9.50988E+03          (largest  tally)/(avg nonzero tally)= 8.50877E+00

 (confidence interval shift)/mean  = 0.0000               shifted confidence interval center  = 1.86528E-10

 if the largest  history score sampled so far were to occur on the next history, the tfc bin quantities would change as follows:

      estimated quantities          value at nps          value at nps+1          value(nps+1)/value(nps)-1.

      mean                           1.86527E-10            1.86537E-10                  0.000053
      relative error                 2.89762E-03            2.89795E-03                  0.000114
```

```
      variance of the variance        1.70047E-05          1.71047E-05                0.005881
      shifted center                  1.86528E-10          1.86528E-10                0.000000
      figure of merit                 9.92202E+01          9.91976E+01               -0.000228

 the estimated inverse power slope of the 200 largest  tallies starting at 8.55647E-04 is 4.4286
 the empirical history score probability density function appears to be increasing at the largest  history scores:
 please examine. see print table 161.
 the large score tail of the empirical history score probability density function appears to have no unsampled regions.

 fom = (histories/minute)*(f(x) signal-to-noise ratio)**2 = (1.496E+05)*( 2.575E-02)**2 = (1.496E+05)*(6.631E-04) = 9.922E+01

1status of the statistical checks used to form confidence intervals for the mean for each tally bin

 tally   result of statistical checks for the tfc bin (the first check not passed is listed) and error magnitude check for all bins

        4   missed  1 of 10 tfc bin checks: the estimated mean has a trend during the last half of the problem
          passed all bin error check:     1 tally bins all have relative errors less than 0.10 with no zero bins

       14   passed the 10 statistical checks for the tally fluctuation chart bin result
          passed all bin error check:     1 tally bins all have relative errors less than 0.10 with no zero bins

       24   missed  2 of 10 tfc bin checks: the variance of the variance does not monotonically decrease over the last half of problem
          passed all bin error check:     1 tally bins all have relative errors less than 0.10 with no zero bins

       34   passed the 10 statistical checks for the tally fluctuation chart bin result
          passed all bin error check:     1 tally bins all have relative errors less than 0.10 with no zero bins

 the 10 statistical checks are only for the tally fluctuation chart bin and do not apply to other tally bins.

 warning.       2 of the     4 tally fluctuation chart bins did not pass all 10 statistical checks.

results of 10 statistical checks for the estimated answer for the tally fluctuation chart (tfc) bin of tally 4

tfc bin behavior	--mean-- behavior	---------relative error--------- value	decrease	decrease rate	----variance of the variance---- value	decrease	decrease rate	--figure of merit-- value	behavior	-pdf- slope
desired	random	<0.10	yes	1/sqrt(nps)	<0.10	yes	1/nps	constant	random	>3.00
observed	random	0.00	yes	yes	0.00	yes	yes	constant	random	6.74
passed?	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes

==========

this tally meets the statistical criteria used to form confidence intervals: check the tally fluctuation chart to verify.
the results in other bins associated with this tally may not meet these statistical criteria.

----- estimated confidence intervals: -----

estimated asymmetric confidence interval(1,2,3 sigma): 3.8182E-07 to 3.8374E-07; 3.8087E-07 to 3.8470E-07; 3.7991E-07 to 3.8566E-07

```
 estimated  symmetric confidence interval(1,2,3 sigma): 3.8182E-07 to 3.8374E-07; 3.8086E-07 to 3.8470E-07; 3.7991E-07 to 3.8566E-07

1analysis of the results in the tally fluctuation chart bin (tfc) for tally 4 with nps = 2547729148         print table 160

 normed average tally per history  = 3.82781E-07         unnormed average tally per history  = 7.75832E-07
 estimated tally relative error    = 0.0025             estimated variance of the variance  = 0.0000
 relative error from zero tallies  = 0.0022             relative error from nonzero scores  = 0.0012

 number of nonzero history tallies =      211686        efficiency for the nonzero tallies  = 0.0001
 history number of largest  tally  =   248095536        largest  unnormalized history tally = 2.21871E-02
 (largest  tally)/(average tally)  = 2.85978E+04        (largest  tally)/(avg nonzero tally)= 2.37614E+00

 (confidence interval shift)/mean  = 0.0000             shifted confidence interval center  = 3.82782E-07

 if the largest  history score sampled so far were to occur on the next history, the tfc bin quantities would change as follows:

      estimated quantities          value at nps          value at nps+1          value(nps+1)/value(nps)-1.

      mean                           3.82781E-07            3.82785E-07                  0.000011
      relative error                 2.50359E-03            2.50359E-03                 -0.000001
      variance of the variance       7.22367E-06            7.22378E-06                  0.000016
      shifted center                 3.82782E-07            3.82782E-07                  0.000000
      figure of merit                1.66181E+01            1.66181E+01                  0.000002

 the estimated inverse power slope of the 127 largest  tallies starting at 2.18128E-02 is 6.7401
 the empirical history score probability density function appears to be increasing at the largest  history scores:
 please examine. see print table 161.
 the large score tail of the empirical history score probability density function appears to have no unsampled regions.

 fom = (histories/minute)*(f(x) signal-to-noise ratio)**2 = (2.654E+05)*( 7.913E-03)**2 = (2.654E+05)*(6.262E-05) = 1.662E+01

1tally       14        nps =  2547729148

TRUPACT-II SAR, Revision 25, October 2021			
Section	**Page**	**Change Description**	**Justification**
General		Revised header for date.	Administrative change. No impact to safety basis.
5.3.1	5.3-1	Deleted the following text: "Any significant deviation from the NCT configuration assumption is precluded through the use of preshipment radiological surveys of the package to validate that the source(s) are reasonably distributed within the package. However, it should be noted that even without the preshipment measurement confirmation, HAC dose rate requirements are ensured by these conservative analysis assumptions."	As described in the response to RAI-Sh-10, the sentences have been removed to avoid confusion and/or conflicting interpretation.
5.3.1.7	5.3-4	Revised Reference 4 from Rev. 0 to Rev. 1.	In response to RAI-St-1, HPT-REP-0001, *Regulatory Hypothetical Accident Condition Type B Testing for the HalfPACT Shielded Container Payloads*, was revised to add the DOT-7A Type A 4-foot drop test results for the SC-55G1.
5.4.5	5.4-13	Added new Section 5.4.5, *Evaluation for Axial Gaps in the Sidewall Lead*	In response to RAI-Sh-8, a new Section 5.4.5 was added to summarize the results of SCA-CAL-0005, *Effect of Axial Gaps in the SC-30G2, SC-30G3, and SC-55G2 Lead Sidewalls.*
5.5.8	5.5-39	Corrected the DCF equation for the SC-55G1 from "$DCF_{SC-55G1} = 0.0051*\rho^3 - 0.0987*\rho^2 + 0.8030*\rho + 0.2342$" to "$DCF_{SC-55G1} = 0.0024*\rho^3 - 0.0668*\rho^2 + 0.7557*\rho + 0.2630$"	In response to RAI-Sh-3, the DCF equation for the SC-55G1 has been corrected in Section 5.5.8 of the TRUPACT-II SAR.

HalfPACT SAR, Revision 8, October 2021

CH-TRU Payload Appendices, Revision 5, October 2021			
Section	**Page**	**Change Description**	**Justification**
General		Revised header for date.	Administrative change. No impact to safety basis.
4.7	4.7-5	Revised the reference to HPT-REP-0001 from Rev. 0 to Rev. 1.	Administrative change. No impact to safety basis.
4.8	4.8-5	Revised the reference to HPT-REP-0001 from Rev. 0 to Rev. 1.	Administrative change. No impact to safety basis.
4.9	4.9-5	Revised the reference to HPT-REP-0001 from Rev. 0 to Rev. 1.	Administrative change. No impact to safety basis.
4.10	4.10-5	Revised the reference to HPT-REP-0001 from Rev. 0 to Rev. 1.	Administrative change. No impact to safety basis.

HPT-REP-0001, Revision 1, October 2021			
Section	**Page**	**Change Description**	**Justification**
General	Various	Revised text to consistently use “HAC Type B” and “DOT-7A Type” terms to differentiate tests.	Administrative change.
1.2	1	Added text to clarify testing performed previously for the SC-30G1.	In response to RAI-St-1; text added to clarify that Type A 4-foot drop tests are to support certification of shielded containers as DOT-7A Type A packaging in accordance with 49 CFR §178.350 requirements. Added text to help distinguish the difference between drop tests.
1.2	2	Inserted a table and text providing a summary of all Type A and Type B drop testing.	In response to RAI-St-1, the revisions summarize the drop tests that were performed for each shielded container.
2.0	3	Added Reference 11 for new SCA-CAL-0005, *Effect of Axial Gaps in the SC-30G2, SC-30G3, and SC-55G2 Lead Sidewalls*, Rev. 0.	In response to RAI-Sh-08, SCA-CAL-0005, *Effect of Axial Gaps in the SC-30G2, SC-30G3, and SC-55G2 Lead Sidewalls* was developed and is now referenced in HPT-REP-0001, Rev. 1.
6.1	31	Added new Section 6.1.1, *SC-55G1 Shielded Container HAC Type B Tests* (heading only).	This section heading was added to clarify that Section 6.1.1 is specific to the HAC Type B 30-foot drop tests.
6.1.2	45	Added new Section 6.1.2, *SC-55G1 Shielded Container DOT-7A Type A Tests* (heading only).	This section heading was added to clarify that Section 6.1.2 is specific to the DOT-7A Type A tests.
6.1.2.1	45 – 47	Added new Section 6.1.2.1, *SC-55G1 Free Drop Tests*.	In response to RAI-St-1(b), Section 6.1.2.1 was added to discuss the DOT-7A Type A 4-foot drop tests that were conducted on the SC-55G1.
6.2	48	Added new Section 6.2.1, *SC-30G3 Shielded Container HAC Type B Tests* (heading only).	This section heading was added to clarify that Section 6.2.1 is specific to the HAC Type B 30-foot drop tests.
6.2.1.2.1	48	Added reference to Figure 6-30.	Administrative change. No impact to safety basis.
6.2.1.2.2	49	Changed to reference Figure 6-33.	Administrative change. No impact to safety basis.
6.2.1.2.3	49	Changed to reference Figure 6-30.	Administrative change. No impact to safety basis.

HPT-REP-0001, Revision 1, October 2021			
Section	**Page**	**Change Description**	**Justification**
6.2.1.2.3	51	Moved Figure 6.30 – Pre-End Drop Relative Position of the SC-30G3 Lateral Dunnage.	Administrative change. No impact to safety basis.
6.2.1.2.3	53	Corrected figure title of Figure 6.33 – SC-30G3 Side Drop Radial Flattening of the ICV Shell.	Administrative change. No impact to safety basis.
6.2.1.3, 7.1.2.2, 7.1.3.2,	60, 87, 101	Revised text to reference the new shielding evaluation as Reference 11.	In response to RAI-Sh-08, SCA-CAL-0005, *Effect of Axial Gaps in the SC-30G2, SC-30G3, and SC-55G2 Lead Sidewalls*, was developed.
6.2.2	68 – 79	Added new Section 6.2.2, *SC-30G3 Shielded Container DOT-7A Type A Tests*.	In response to RAI-St-01(b), Section 6.2.2 was added to discuss the DOT-7A Type A 4-foot drop tests that were conducted on the SC-30G3.
7.1.1	80 – 83	Revised Section 7.1.1, *Type B HAC Test versus DOT-7A Type A Test Comparison,* and added new Section 7.1.1.1, *SC-30G3 Visible Damage Comparison*. Also revised heading for Section 7.1.1.2, *SC-30G3 Impact Acceleration Comparison*.	In response to RAI-St-01(b), revised Section 7.1.1 and added Section 7.1.1.1 to clarify the basis for comparison of visible damage between DOT-7A Type A (bare) 4-foot drops versus the HAC Type B (protected) 30-foot drops.

SCA-CAL-0005, Revision 0, October 2021			
Section	**Page**	**Change Description**	**Justification**
All	All	New document provided as part of RAI Response: SCA-CAL-0005, *Effect of Axial Gaps in the SC-30G2, SC-30G3, and SC-55G2 Lead Sidewalls*, Rev. 0.	In response to RAI-Sh-08, SCA-CAL-0005, *Effect of Axial Gaps in the SC-30G2, SC-30G3, and SC-55G2 Lead Sidewalls* was developed.
