## Fire Safety Analysis

**Fire Area ID:** 1-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump aligned to Train A / Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A / Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A/Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b> 1-004-U2 - Aux Building <b>Compliance Basis:</b> NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		<b>Engineering Evaluations</b>
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 7, TE-BE-03-9898-001, Technical Evaluation in Support of GL 86-10 for DCP 03-1-9898, Reroute Appendix R RWST Suction Valve Cables	
<b>Inactive</b>	Yes	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the adequacy of the separation for redundant trains of the RWST suction valves. The valves are not separated in accordance with the requirements of Appendix R, Section III.G.2 in that the area of spatial separation is not provided with whole area suppression.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on spatial separation, location of combustibles, limited in situ combustibles, whole area detection with partial suppression, and fire barriers. In addition, administrative controls have been established to maintain the non-suppressed area free of transient combustibles or to establish compensatory actions.</p>	
<b>Engineering Evaluation ID</b>	ENGDOC, DOEJ-SM-03-0415-001 Applicability of NFPA 80 Door Closer Requirements	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation addresses a select number of fire doors that occasionally may not automatically latch closed due to "abnormal air pressure".</p> <p>Bases for Acceptability:</p> <p>The specific fire doors cited are PA101, 201 and 497. The evaluation justifies the door latching deviation by taking credit for plant staff that ensure all fire doors are closed after entry or egress.</p>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-004-U2 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the two code editions</li> <li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li> <li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-004-U2 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

1976.

- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment G Code Compliance Evaluation for NFPA 15, 2007 Edition, Water Spray Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 15, 2007 Edition and NFPA 15, 1973 Edition. The approach was to determine the applicable code editions for the water spray systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the applicable codes
- The water spray systems were determined to be compliant with the relevant sections of NFPA 15-2007 and NFPA 15-1973, with the exception of the non-compliances identified in the evaluations
- Some non-compliances against the 2007 Edition were resolved by vetting against the 1973 Edition, which has been identified by SNC as the FNP code of record
- All other non-compliances have been provided with justifications

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment K Code Compliance Evaluation for NFPA 30, 2008 Edition, Flammable and Combustible Liquids Code

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 30, 2008 Edition. The approach was to determine the applicable code edition for flammable & combustible liquids, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Flammable and combustible liquids were determined to be compliant with the relevant sections of NFPA-30-2008, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were resolved in Appendix D, which vetted the 2008 edition non-compliances against the FNP code of record edition of 1972.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

## Fire Safety Analysis

**Fire Area ID:** 1-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-004-U2 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

### Licensing Action

Appendix R Exemption (No. 1-39), Unit 1 Aux Building (Fire Area 1-004), Enclosure of one train of redundant cable by a 1 hr rated barrier with automatic suppression (III.G.2.c criteria) and separation by 3 hr barrier (III.G.2.a criteria)

### Licensing Basis

Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression and lack of separation of redundant trains by 3 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:

For redundant electrical power distribution system:

- The redundant MCCs 1A and 1B are separated by a 2-ft-thick reinforced concrete floor at el 139 ft - 0 in.
- Unsealed penetrations have been reviewed and will not affect separation.
- Minimum horizontal separation between components is approximately 60 feet with complete automatic suppression coverage at el 121 ft - 0 in.
- The redundant dc distribution panels 1C and 1F are separated by a 2-ft-thick reinforced concrete floor at el 139 ft.
- The minimum horizontal separation between these redundant panels is approximately 40 ft and has complete automatic suppression coverage at el 121 ft - 0 in. and 139 ft - 0 in.
- A smoke detection system is installed in all rooms containing the subject equipment.
- Manual hose stations, portable extinguishers, and portable smoke removal equipment are available for use on the subject elevations.

For steam generator pressure instrumentation:

- A fire rated barrier has been provided in room 462 for raceways 21E047, 21E048, 31E017, 41E019 and 41E017.
- A fire rated barrier inside the following conduits is provided where they attach to pull boxes located in room 462 -21E045, 21E047, 31E018, 31E020, 41E017, and 41E019.
- Partial suppression system covers the area of modification In the east portion of room 462.
- Unsealed penetrations in the subject wall have been reviewed.
- Approximate 32-ft horizontal separation between redundant steam generator pressure instruments and cabling.
- Smoke detection system in rooms
- Automatic fixed suppression system and the barriers provided for redundant cabling in room 462 would protect the redundant S/G B and C instrumentation.
- A portable extinguisher and manual hose station are available for use in room 464.
- Based upon the modification, the existing raceway barriers, smoke detection, and fixed suppression in the area, a credible fire in room 462 would not affect the ability to monitor S/G A pressure.
- Control room actions can be performed for resetting spurious SI, CVI, or CI safety signals.

For instrument air:

- Redundant cables are separated by a 2-ft-thick reinforced concrete floor at el 121 ft - 0 in. and 139 ft - 0 in.
- Unsealed penetrations in the subject floors have been reviewed and will not affect the separation afforded by the concrete floor.
- Train A cables have full suppression coverage on el 100 ft - 0 in. and el 139 ft - 0 in.
- Train B cables have full suppression coverage on el 121 ft - 0 in.
- Smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations and portable extinguishers are available for use on the subject elevations.

For battery room ventilation:

- The requirement for battery and battery charger room ventilation is a long term requirement.
- Either portable ventilation equipment will be installed in the effected room(s) or
- The damaged ventilation system will be repaired within 20 hours of post-fire hot shutdown initiation to insure that battery room hydrogen concentrations do not

## Fire Safety Analysis

**Fire Area ID:** 1-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Previously Approved Engineering Evaluations

exceed acceptable limits.

For boration/makeup, depressurization, and RCP seal integrity:

- A fire rated barrier has been provided for train-A power cable raceway ADDA21, ADDA18, ADDA15, and ADDA09.
- The existing fire rated barrier on raceway BFDB03 has been extended and a fire rated barrier for raceway BHFA03 is being provided
- An open penetration in floor slab has been sealed.
- Suppression coverage is provided in rooms 163, 162, 161, 160, 175, and 186.
- Redundant power cables are separated by a 2-ft-thick reinforced concrete wall bounding rooms with the exception of room 155, where there is approximately 32 ft of separation.
- Unsealed penetrations have been reviewed and the walls afford adequate separation.
- A smoke detection system is installed in all rooms containing the subject charging pump cabling.
- Manual hose stations, portable extinguishers, and portable smoke removal equipment are available for use on this elevation.
- EI 100 ft - 0 in. Train-B cables are protected by a fire rated barrier which extends to a point of 40-ft horizontal separation from the redundant train-A cables.
- Automatic fired suppression and smoke detection systems provide coverage for the subject cables.
- EI 121 ft - 0 in. redundant cables have a minimum horizontal separation of approximately 40 ft.
- The train-B power and control cables are provided with automatic suppression and smoke detection coverage
- Redundant train-A and -B charging pump room cooler power and control cables are separated by a 2-ft-thick reinforced concrete slab floor at el 121 ft - 0 in.
- Unsealed penetrations in the floor slab have been reviewed and are considered to afford adequate separation.

For main steam isolation:

- Manual action can be performed to manually trip the TDAFW pump throttle valve Q1N12MOV3406-A.

For steam release (cooldown):

- Manual action can be performed to open or close the atmospheric relief valves.

For neutron flux monitoring:

- Configuration of redundant equipment cables and equipment with respect to barriers would limit the fire to one train of equipment.
- Unsealed penetrations in the subject floor slab have been reviewed and are considered not to affect the separation afforded by the concrete floor.

For reactor coolant boundary integrity:

- Manual action can be performed to remove power from all cables in the shared raceway. This can be accomplished by opening the supply breaker on 125 V-dc switchgear 1A (Q1R42B001A-A) for 125 V-dc distribution panel 1C (Q1R41L001C-A).

For the lack of full area smoke/fire detection:

- All cabling in rooms without detection is routed in conduits.
- There are no combustibles in these rooms.
- There are no functionally redundant safe shutdown cables in these rooms.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-1-9941, DCP 03-1-9926, DCP 03-1-9928, DCP 03-1-9898, and DCP 03-1-9902. Note that raceway 31E020 with Kaowool raceway fire barrier is not addressed in the Kaowool elimination resolution table.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

<b>Licensing Action</b>	Appendix R Exemption (No. 1-39), Unit 1 Aux Building (Fire Area 1-004), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>For the non-fire rated hatch covers:</p> <ul style="list-style-type: none"> <li>• Suppression system in room 163 in the area of the subject steel hatch cover</li> <li>• Analysis of safe shutdown showed that physical separation was adequate</li> <li>• Detection system provided in rooms 163 and 103</li> <li>• Sprinkler systems in room 345 and 454 will serve the purpose of a water curtain to prevent the passage of fire through the non-rated steel hatch.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The fire severity in the affected rooms is less than 30 minutes for all cases.</li> <li>• A sprinkler system is installed in rooms 161, 179, 2161, and 2179</li> <li>• Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-004-U2 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)

### Licensing Basis

Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:

All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:

- Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.
- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-005 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by stopping the reactor makeup water pumps to prevent boron dilution and by charging borated water from the RWST using Train A charging pump.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train A charging pump aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>Unit 1: Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> <li>Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-005 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with Train A PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1A. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored in the Control Room. 6. SG Level - Steam Generator 1A/1B/1C level is monitored in the Control Room.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by {off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-005 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-005 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	1-005 - Aux Building Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-34), Unit-1 Aux. Building, EI 100 ft (Fire Area 1-005), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria) and 3 hour fire barrier (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, and lack of 3 hour rated fire barrier between redundant trains, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>For physical separation of the charging pumps:</p> <ul style="list-style-type: none"> <li>• The pump rooms are watertight with 2-ft thick reinforced concrete walls.</li> <li>• Penetrations in the pump room walls are sealed to provide a watertight boundary</li> <li>• Lubricating oil and cable insulation are the only combustibles present in the pump rooms. Lubricating oil would be contained within the individual rooms or would drain into the sump servicing the room.</li> <li>• Fixed suppression system is installed in the hallway.</li> <li>• Smoke detection systems are installed throughout the area including the three charging pump rooms.</li> <li>• The maximum fire severity in these rooms due to in-situ loading is estimated to be less than 1 hour.</li> <li>• The penetrations that are sealed have been included into the penetration seal surveillance program.</li> </ul> <p>For RWST isolation valves:</p> <ul style="list-style-type: none"> <li>• A fire barrier has been provided for the portions of raceway sections AHFA15, AHF031, AHDB12, AFD-30, AEF028 that carry cables for RWST isolation valve LCV115B-A in room 172.</li> </ul> <p>For reactor coolant boundary integrity:</p> <ul style="list-style-type: none"> <li>• A fire barrier has been provided for raceway section AHDB12 to protect cables for the subject reactor coolant boundary integrity valves in all portions of Fire Area 1-005 with the exception of room 181.</li> <li>• For a fire in room 181, manual operator actions can be performed to regain control of the transfer relays associated with the PORVs and the reactor head vent valves.</li> </ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-1-9898, DCP 03-1-9907, DCP 03-1-9898, and DCP 03-1-9941.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The fire severity in the affected rooms is less than 30 minutes for all cases.</li> <li>• A sprinkler system is installed in rooms 161, 179, 2161, and 2179</li> <li>• Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

		Previously Approved Engineering Evaluations
<b>Fire Area ID:</b>	1-005 - Aux Building	
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"><li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li><li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li><li>• The weld strength is equivalent to that of the structural supporting steel material.</li><li>• A seismic event is not postulated to occur concurrently with the fire.</li></ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 1-006 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Fire Area Definition

Fire Zone ID	Description	Elevation(s)
0185	185 Component Cooling Water Heat Exchanger Room	
0189	189 Plant Heating Equipment Room	
0190	190 Motor Control Center 1E Room	
0191	191 Auxiliary Feedwater Pump Room	
0192	192 Auxiliary Feedwater Pump Room	
0193	193 Auxiliary Feedwater Pump Room	
0194	194 Equipment Room	
0195	195 Access Hatch Room	
0199	199 Phosphate Tank and Pump Area	
0241	241 Main Steam and Feedwater Valve Room	
0242	242 Pipe Chase	
0243	243 Pipe Chase	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-006 - Aux Building	<b>Systems and Features</b>
<b>Fire Zone ID:</b>	0185 - 185 Component Cooling Water Heat Exchanger Room	

### Extinguishers

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
A15	Aux. Bldg-100'-Comp. Cool. Pump Room	Yes	-	-- Ch3: 3.7 Fire Extinguishers.	Yes	-
A15-1	Aux. Bldg-100'-Comp. Cool. Pump Room	Yes	-	-- Ch3: 3.7 Fire Extinguishers.	Yes	-

### Hose Stations

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
N1V43D108	Hose Station - N1V43D108-FZ 6 Room 185	Yes	-	-- Ch3: 3.6 Standpipe and Hose Stations.	Yes	-

### Active Fire Protection - Detection

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
1A-27-2	U1-6 Detection System 1A-27-2 Room 185	-	Yes	-- E: Required to support an Engineering Evaluation. -- R: Required to meet Risk criteria. -- D: Required to meet DID criteria. -- S: Required to meet Separation criteria. -- N: Required to meet NPO criteria.	Yes	Yes
Heat Detectors-1	U1-6 Detection System Heat Detectors-1 Room 185	-	Yes	-- E: Required to support an Engineering Evaluation. -- R: Required to meet Risk criteria. -- S: Required to meet Separation criteria. -- N: Required to meet NPO criteria.	Yes	-

### Active Fire Protection - Suppression

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
GS-1A-27-1	Local CO2 system in Fire Area 6 , room number 185, 5 KV Disconnect Switch 1A (CCW Pump 1B)	-	-		-	-
GS-1A-27-2	Local CO2 system in Fire Area 6 , room number 185, 5 KV Disconnect Swtich 1B (CCW Pump 1B)	-	-		-	-
WS-1A-119-1	Preaction Sprinkler System, U1-6, Aux Building Elevation 100' North West Corner of CCW Pump Room, Room 185	-	Yes	-- E: Required to support a fire area boundary evaluation. -- D: Required to meet DID criteria.	Yes	-
WS-1A-27-1	Preaction Sprinkler System, U1-6, Aux Building Elevation 100' CCW Heat Exchanger and Pump Room, Room 185	-	Yes	-- E: Required to support a fire area boundary evaluation. -- D: Required to meet DID criteria.	Yes	-

### Fire Barriers

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
U1-FNP-CEILING-0122/0185-1/6-100	3:00, , U1 3 hr. Rated Barrier at ele 83 between Rooms 122/185 and fire areas 1/6	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U1-FNP-Ceiling-118/185-1/6-100	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U1-FNP-Ceiling-119/185-1/6-100	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U1-FNP-Ceiling-120/185-1/6-100	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U1-FNP-Ceiling-128/185-1/6-100	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U1-FNP-Ceiling-129/185-1/6-100	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	Yes
U1-FNP-Ceiling-130/185-1/6-100	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U1-FNP-Ceiling-131/185-1/6-100	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	Yes
U1-FNP-Ceiling-185/116-6/8-121	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-

## Fire Safety Analysis

**Fire Area ID:** 1-006 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train A charging pump aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>Unit 1: Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> <li>Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-006 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with aux spray for pressure reduction and Pressurizer Heater Group B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Performance-based approach ensure decay heat removal using either the MDAFW or TDAFW pumps. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Performance-based approach Steam Generator 1A.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-006 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Nuclear Safety Performance Goals

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train B component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-006 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 1-006 - Aux Building		Previously Approved Engineering Evaluations
<b>Compliance Basis:</b> Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach		
<b>Licensing Action</b>	Appendix R Exemption (No. 1-17), Unit 1 Non-Rad Side Corridor - Auxiliary Building, EI 121 ft (Fire Area 1-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• The construction and the installation of door/transom assemblies separating rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li><li>• The sprinkler system in room 234 will serve as a water curtain to prevent the passage of a fire through the non-rated steel hatches. Sprinkler systems in the hatch area above and below room 234 will prevent the spread of fire from these areas into Fire Area 1-020.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-38), Unit 1 Auxiliary Building, Elevations 100, 127, 139, 155, and 175 ft. (Fire Area 1-006), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of 20 feet horizontal distance separation between safe shutdown circuits with no intervening combustibles, with fire detection and automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>For AFW pump rooms:</p> <ul style="list-style-type: none"><li>• A fire barrier has been provided for the train-B motor driven auxiliary feedwater pump cables with the exception of the train-B pump room (192). The subject raceways are BDDA09, BDDA06, BDDA03, BDDA0A, BEE016, and BFDD0M.</li><li>• Watertight room construction for the Train B pump.</li><li>• Low quantity of combustible material with a maximum fire severity of less than one hour.</li><li>• A smoke detection system in the AFW pump room.</li><li>• The availability of equipment for use by the fire brigade.</li></ul> <p>For CCW pump and heat exchanger rooms:</p> <ul style="list-style-type: none"><li>• A smoke detection system and automatic fire suppression system is installed throughout the area.</li><li>• Low quantity of combustible material with a maximum fire severity of less than 30 minutes.</li><li>• The availability of equipment for use by the fire brigade.</li><li>• Heat detectors are provided in the 5-kV CCW pump disconnect switch; 5-kV disconnect switch cabinets are provided with a total-flooding Carbon Dioxide system.</li><li>• The CCW pump cables are wrapped with two 1-in. layers of Kaowool with the exception of the train-A cables for the swing CCW pump which are wrapped with a single 1-in. layer.</li><li>• Cables for the train-B service water inlet and discharge valves on the CCW heat exchangers are protected by two 1-in. layers of Kaowool and covered by automatic suppression.</li><li>• Redundant service water valves are separated by a distance of approximately 10 ft. with minimal intervening combustibles consisting primarily of cable insulation.</li></ul> <p>For main steam valve room:</p> <ul style="list-style-type: none"><li>• Adequate degree of separation is provided between MSARVs, main steam and bypass isolation valves, and AFW flow control valves and their associated</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-006 - Aux Building Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	Previously Approved Engineering Evaluations
	<ul style="list-style-type: none"><li>control cabling in room 241.</li><li>• Minimum combustible loading.</li><li>• A smoke detection system is installed in the room.</li><li>• Administrative controls are imposed at the plant to limit access to room 241 during plant operations.</li><li>• Manual actions can be performed to manually open or close the atmospheric relief valves.</li></ul> <p>Although not specifically addressed in APC and NRC correspondence for this exemption request, the FSAR provided the following justification for the lack of full area smoke detection coverage in this fire area:</p> <ul style="list-style-type: none"><li>• For rooms without detection, cables in one room are routed in conduits with no in-situ combustible materials or redundant safe shutdown functions.</li><li>• Other 2 rooms do not contain any safe shutdown equipment, raceways or combustible materials.</li></ul> <p>Elimination of the reliance on Kaowool raceway fire barriers for the CCW system in this area is resolved by DCP 03-1-9931, DCP 03-1-9941, and DCP 03-1-9934. For the Train B motor driven auxiliary feedwater pump raceways that are protected with Kaowool in this area, (BDDA09, BDDA06, BDDA03, BDDA0A, BEE016, and BFDD0M), no documentation was found regarding a resolution to eliminate reliance on this Kaowool.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-38), Unit 1 Auxiliary Building, Elevations 100, 127, 139, 155, and 175 ft. (Fire Area 1-006), lack of separation of cables and equipment and associated nonsafety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of a rated 3 hour boundary between fire areas 1-020 and 1-006, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• The sprinkler system installed in rooms 234 and 185 serves the purpose of a water curtain to prevent the spread of fire via the hatchway.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-38), Unit 1 Auxiliary Building, Elevations 100, 127, 139, 155, and 175 ft. (Fire Area 1-006), lack of separation of cables and equipment and associated nonsafety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of a rated 3 hour boundary between fire areas 1-006 and 1-S01, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>A non fire-rated, watertight door # 170 exists between fire area 1-006, room 190 and fire area 1-S01, Stairwell # 1; and a non fire-rated, pressure tight door # 330 exists between fire area 1-006, room 241 and fire area 1-S01, Stairwell # 1.</p> <ul style="list-style-type: none"><li>• These doors are normally maintained closed.</li><li>• Smoke detection is provided in rooms on both sides of these doors. These system alarms locally and are annunciated in the main control room and will provide early warning of a pending fire condition, prompting a fire brigade response.</li><li>• An automatic fire suppression system is provided in room 190.</li><li>• Portable extinguishers and fire hose cabinets are available outside of the stairwell # 1 at each elevation except 175 feet for fire brigade's use.</li><li>• The combustible loading in room 241 (main steam valve room) is less than 30 minutes and access to this area during plant operation is restricted. Based on the configuration and fire protection provided, a fire on either side of these doors will not propagate to the adjacent fire area.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	1-006 - Aux Building Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
	This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"><li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li><li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li><li>• The weld strength is equivalent to that of the structural supporting steel material.</li><li>• A seismic event is not postulated to occur concurrently with the fire.</li></ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 1-008-U1 - Aux Building Cable Chase, Room 116  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train B PORV evaluated in FRE for loss of instrument air for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Performance-based approach ensure that adequate shutdown margin is achieved.2.RCS Pressure - RCS pressure is monitored in the Control Room.3.Pressurizer Level - Pressurizer level is monitored by PZR level CH 3.4.RCS Temperature - Performance-based approach ensures that adequate RCS Loop 1/Loop 2/Loop 3 temperature monitoring is available.5.SG Pressure - Steam Generator 1A/1B/1C pressure is monitored in the Control Room.6.SG Level - Steam Generator 1A/1B/1C level is monitored in the Control Room.	
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by diesel generator EDG-1B.2.4.16 kV and 600 V power is supplied by Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 1-008-U1 - Aux Building Cable Chase, Room 116

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-008-U1 - Aux Building Cable Chase, Room 116	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	ENGDOC, Acceptability Determination of Penetration Seals #24-100-32; 09-139-9; and 02-139-29	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of this evaluation is to document the acceptability of FNP Unit 1 Penetration Seals #24-100-32, 09-139-9, and 02-139-29 as 3-hour rated fire barriers.</p> <p>Bases for Acceptability:</p> <p>The evaluation demonstrates that the penetrations have been evaluated as acceptable 3-hour rated penetrations based on the features of construction as compared to test results furnished by various recognized industry tests.</p>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance</li></ul>

### Engineering Evaluations

<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 15, 2007 Edition and NFPA 15, 1973 Edition. The approach was to determine the applicable code editions for the water spray systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The water spray systems were determined to be compliant with the relevant sections of NFPA 15-2007 and NFPA 15-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1973 Edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have been provided with justifications</li></ul>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

Fire Area ID: 1-008-U1 - Aux Building Cable Chase, Room 116 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-14), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-008), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-20), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-008), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 1-008-U2 - Aux Building Cable Chase, Room 116  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-008-U2 - Aux Building Cable Chase, Room 116  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by {off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-008-U2 - Aux Building Cable Chase, Room 116  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluations**

### Summary

Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

## Fire Safety Analysis

Fire Area ID: 1-008-U2 - Aux Building Cable Chase, Room 116 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-14), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-008), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li><li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-20), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-008), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 1-009-U1 - Aux Building Cable Chase, Rooms 117 & 246  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV and block valve are evaluated in the FRE. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2.2.RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2 and RCS wide range pressure for Loop 3.3.Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2.4.RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs.5.SG Pressure - Steam Generator 1A/1B/1C pressure is monitored in the Control Room.6.SG Level - Steam Generator 1A/1B level is monitored in the Control Room.	
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by diesel generator EDG1-2A.2.4.16 kV and 600 V power is supplied by Train A distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A equipment.	

## Fire Safety Analysis

**Fire Area ID:** 1-009-U1 - Aux Building Cable Chase, Rooms 117 & 246  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-009-U1 - Aux Building Cable Chase, Rooms 117 & 246 NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-31), Unit 1 Train-B Inside Cable Chases, Auxiliary Building (Fire Area 1-009), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer PORVs and assure CCW to the 1B heat exchanger when it is aligned and operating as the train-A heat exchanger.</li> <li>• Multiple hot shorts can be mitigated by removing 125 V-dc power from cables in the shared raceway. This can be accomplished by opening the breaker on 125 V-dc switchgear bus 1B (Q1R42B001B-B) for 125 V-dc distribution panels 1D, 1E, and 1F. In the interim, alternate charging flow is available to keep up with the spurious letdown.</li> <li>• One train of control cables associated with one of the auxiliary feedwater isolation valves is enclosed in a one-hour equivalent fire barrier.</li> </ul> <p>Note that SNC correspondence regarding the elimination of the reliance on Kaowool does not address the fire barrier in this fire area.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-34), Unit 1 Train B Inside Cable Chase, Auxiliary Building (Fire Area 1-009 Unit 2 Cabling), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985, APC letter to the NRC, provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 1-009-U2 - Aux Building Cable Chase, Rooms 117 & 246  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-009-U2 - Aux Building Cable Chase, Rooms 117 & 246  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-009-U2 - Aux Building Cable Chase, Rooms 117 & 246	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
----------------------------------	---	--

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-009-U2 - Aux Building Cable Chase, Rooms 117 & 246 NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-31), Unit 1 Train-B Inside Cable Chases, Auxiliary Building (Fire Area 1-009), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer PORVs and assure CCW to the 1B heat exchanger when it is aligned and operating as the train-A heat exchanger.</li> <li>• Multiple hot shorts can be mitigated by removing 125 V-dc power from cables in the shared raceway. This can be accomplished by opening the breaker on 125 V-dc switchgear bus 1B (Q1R42B001B-B) for 125 V-dc distribution panels 1D, 1E, and 1F. In the interim, alternate charging flow is available to keep up with the spurious letdown.</li> <li>• One train of control cables associated with one of the auxiliary feedwater isolation valves is enclosed in a one-hour equivalent fire barrier.</li> </ul> <p>Note that SNC correspondence regarding the elimination of the reliance on Kaowool does not address the fire barrier in this fire area.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-34), Unit 1 Train B Inside Cable Chase, Auxiliary Building (Fire Area 1-009 Unit 2 Cabling), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985, APC letter to the NRC, provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

**Fire Area ID:** 1-012 - Hallway & Local Hot Shutdown Panel Room  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>Unit 1: Performance-based approach to isolate normal letdown using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using an one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV valve and Train B block valve. The RCS to RHR high/low pressure interface is isolated using the Train A and Train B RHR inboard isolation valve and Train A and Train B RHR outboard isolation valve.</li> <li>Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using either the containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-012 - Hallway & Local Hot Shutdown Panel Room  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Performance-based approach for positive control of RCS pressure is accomplished with for pressure reduction to ensure Train A/Train B PORV or aux spray and Pressurizer Heater Group B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Performance-based approach for decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump or TDAFW pump supplying Steam Generator 1B or 1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 2. 4. RCS Temperature - RCS Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-012 - Hallway & Local Hot Shutdown Panel Room  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Nuclear Safety Performance Goals

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train B component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-012 - Hallway & Local Hot Shutdown Panel Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>

<b>Engineering Evaluation ID</b>	ENGDOC, Acceptability Determination of Farley Nuclear Plant Unit 1 Fire Penetration Seals #45-121-26
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to document the evaluation of the acceptability of FNP Unit 1 Penetration Seal #45-121-26 which contains multiple penetrants, including copper tubing, as both a 3-hour rated fire barrier and an airtight seal.</p> <p>Bases for Acceptability:</p> <p>The copper tubing within penetration seal #45-121-26 does not invalidate the barrier because the copper lines will not:</p> <ul style="list-style-type: none"><li>• melt in an assumed design basis fire,</li><li>• fail at the penetration seal due to over-pressurization;</li><li>• fail the fire barrier due to the loss of a soldered joint; or</li><li>• fail the fire barrier due to thermal expansion.</li></ul>

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation addresses a select number of fire doors that occasionally may not automatically latch closed due to "abnormal air pressure".</p> <p>Bases for Acceptability:</p> <p>The specific fire doors cited are PA101, 201 and 497. The evaluation justifies the door latching deviation by taking credit for plant staff that ensure all fire doors are closed after entry or egress.</p>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M    Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-012 - Hallway & Local Hot Shutdown Panel Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	
<hr/>		
<b>Licensing Action</b>	Appendix R Exemption (No. 1-32), Unit 1 Auxiliary Building Local Hot Shutdown Panel Room (Fire Area 1-012), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of the transfer relays for the PORVs, reactor head vent valves and the main steam isolation valves, control of instrument and control of a main steam atmospheric relief valve.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<hr/>		
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

**Fire Area ID:** 1-012 - Hallway & Local Hot Shutdown Panel Room  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

## Fire Safety Analysis

**Fire Area ID:** 1-013-U1 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by performance-based approach for isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV valve and Train B PORV valve. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train A charging pump, swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valves remain closed and performance-based approach for normal spray valve and the Loop 1 and Loop 2 RCPs. Undesired pressure increase is prevented by performance-based approach to deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1B. Main feed is isolated using performance-based approach to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 2. 4. RCS Temperature - RCS Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Performance-based approach for Steam Generator 1B pressure monitoring. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-013-U1 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied using performance-based approach by diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Performance-based approach Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system location of equipment being above water collection area in chase. There are no drains in the electrical chase, but all water would collect below the cable trays. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-013-U1 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.

Bases for Acceptability:

## Fire Safety Analysis

**Fire Area ID:** 1-013-U1 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on

- full area detection and suppression;
- limited fire hazards;
- an assessment of in situ combustibles; and
- the substantial construction of the fire area boundary.

To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-013-U1 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500 NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-16), Unit 1 Auxiliary Building Vertical Cable Chase (Fire Area 1-013), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the transfer relays for the PORVs, reactor head vent valves and the main steam isolation valves, control of instrument and control of a main steam atmospheric relief valve.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>Elimination of the reliance on Kaowool fire barriers in this fire area is resolved by DCP 03-1-9901, DCP 03-1-9902, and DCP 03-1-9941. However, note that APC correspondence and NRC SER regarding this exemption request do not take credit for Kaowool fire barriers.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):</p> <ul style="list-style-type: none"> <li>• The MI cable support span is within the fire test configurations.</li> <li>• The materials for the MI cable supports are bounded by the fire test configurations.</li> <li>• The MI cable installation hardware is in accordance with the fire test configurations.</li> <li>• The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.</li> <li>• The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-013-U1 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.

- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-013-U2 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump aligned to Train A / Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A/Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-013-U2 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system location of equipment being above water collection area in chase. There are no drains in the electrical chase, but all water would collect below the cable trays. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-013-U2 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>

<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>

<b>Engineering Evaluation ID</b>	ENGDOC, Acceptability Determination of Farley Nuclear Plant Unit 1 Fire Penetration Seals #45-121-26
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes

## Fire Safety Analysis

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-013-U2 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

---

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
----------------------------------	--

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

<b>Inactive</b>	Yes
-----------------	-----

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.

Bases for Acceptability:

## Fire Safety Analysis

**Fire Area ID:**

1-013-U2 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500

**Engineering Evaluations**

**Compliance Basis:**

NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on

- full area detection and suppression;
- limited fire hazards;
- an assessment of in situ combustibles; and
- the substantial construction of the fire area boundary.

To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-013-U2 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500 NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-16), Unit 1 Auxiliary Building Vertical Cable Chase (Fire Area 1-013), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the transfer relays for the PORVs, reactor head vent valves and the main steam isolation valves, control of instrument and control of a main steam atmospheric relief valve.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>Elimination of the reliance on Kaowool fire barriers in this fire area is resolved by DCP 03-1-9901, DCP 03-1-9902, and DCP 03-1-9941. However, note that APC correspondence and NRC SER regarding this exemption request do not take credit for Kaowool fire barriers.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):</p> <ul style="list-style-type: none"> <li>• The MI cable support span is within the fire test configurations.</li> <li>• The materials for the MI cable supports are bounded by the fire test configurations.</li> <li>• The MI cable installation hardware is in accordance with the fire test configurations.</li> <li>• The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.</li> <li>• The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-013-U2 - Aux Building Cable Chase, Rooms 227, 300, 465, 466, & 500	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.

- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-014 - Computer Room & Duct Chase  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A/Train B charging pump or swing charging pump aligned to Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A/Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV valve and Train B PORV valve. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A/Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with performance-based approach aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1. 2. RCS Pressure - RCS pressure is monitored. 3. Pressurizer Level - Pressurizer level is monitored. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-015 - Communication Room  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Nuclear Safety Performance Goals

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train A component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-015 - Communication Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-016 - Aux Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> <li>Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	

## Fire Safety Analysis

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored. 3. Pressurizer Level - Pressurizer level is monitored. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 1-016 - Aux Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-016 - Aux Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

**Licensing Action** Appendix R Exemption (No. 1-28), Unit 1 Auxiliary Building Battery Room Train B (Fire Area 1-016), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)

**Licensing Basis** Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:

- Manual operator actions can be performed to regain control of the pressurizer PORVs and the transfer relays for the PORVs and the head vent valves.
- Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.

This exemption is no longer required because the FNP nuclear safety capability assessment, SE-C051326701-010, has found that the fire area is compliant with NFPA 805 Section 4.2.3.

**Licensing Action** Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

**Licensing Basis** Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-017 - Aux Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> <li>Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-017 - Aux Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored. 3. Pressurizer Level - Pressurizer level is monitored. 4. RCS Temperature - RCS Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-017 - Aux Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-017 - Aux Building Battery Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-20), Unit 1 Aux Building Train-A Battery Room (Fire Area 1-017), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the FNP nuclear safety capability assessment, SE-C051326701-010, has found that the fire area is compliant with NFPA 805 Section 4.2.3.</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-018 - Aux Building DC Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>• Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.</li> <li>• Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>• Unit 1: RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.</li> <li>• Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>• Unit 1: Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> <li>• Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>• Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.</li> <li>• Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-018 - Aux Building DC Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range CH 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level CH 3. 4. RCS Temperature - RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-018 - Aux Building DC Switchgear Room

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train B component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-018 - Aux Building DC Switchgear Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

## Fire Safety Analysis

**Fire Area ID:** 1-018 - Aux Building DC Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-018 - Aux Building DC Switchgear Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-21), Unit 1 Train-A DC Switchgear Room, Auxiliary Building EI 121 ft (Fire Area 1-018), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li><li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	<ul style="list-style-type: none"><li>• Unit 1: Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li><li>• Unit 2: Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li></ul>	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train A component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

		Previously Approved Engineering Evaluations
<b>Fire Area ID:</b>	1-019 - Aux Building DC Switchgear Room	
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-27), Unit 1 Train-B DC Switchgear Room, Auxiliary Building, EI 121 ft (Fire Area 1-019), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of the pressurizer power operated relief valves (PORVs).</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-020 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train A charging pump aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>Unit 1: Normal letdown is isolated using performance based orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> <li>Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-020 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.</li> <li>Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with performed-based approach Train A PORV or aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using performance-based approach Train A supplying Steam Generator 1B. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Performance-based approach Shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 2. 4. RCS Temperature - RCS Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>

 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries – Service Water	<ul style="list-style-type: none"> <li>Unit 1: Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li> <li>Unit 2: Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li> </ul>	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"> <li>Unit 1: Train A component cooling water is provided with non-essential loads isolated.</li> <li>Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li> </ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	1-020 - Aux Building Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-15), Unit 1 Auxiliary Building Switchgear Room Train B (Fire Area 1-021), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assembly between room 233 (area 1-021) and 228 (area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-17), Unit 1 Non-Rad Side Corridor - Auxiliary Building, EI 121 ft (Fire Area 1-020), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer PORVs transfer relays for PORVs, the main steam isolation valves and RWST charging pump suction valves and the main steam atmospheric relief valves and establish CST level Indication.</li> <li>• Per the FSAR, for the lack of full area automatic fire suppression coverage: <ul style="list-style-type: none"> <li>◦ A smoke detection system provides coverage for the entire fire area.</li> <li>◦ An automatic water suppression system covers the entire fire area except for one room that does not contain any safe shutdown equipment or raceways.</li> <li>◦ Raceways with Kaowool fire barriers are protected by the automatic fire suppression system.</li> <li>◦ Fire fighting equipment is available for use by the fire brigade.</li> </ul> </li> <li>• Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-1-9934, DCP 03-1-9941, and DCP 03-1-9901. However, note that APC correspondence and the NRC SER for this exemption request do not take credit for the Kaowool raceway fire barriers.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-17), Unit 1 Non-Rad Side Corridor - Auxiliary Building, EI 121 ft (Fire Area 1-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> <li>• The sprinkler system in room 234 will serve as a water curtain to prevent the passage of a fire through the non-rated steel hatches. Sprinkler systems in the hatch area above and below room 234 will prevent the spread of fire from these areas into Fire Area 1-020.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 1-021-U1 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV or aux spray for pressure reduction and performance-based approach Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1A/1B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored,	

## Fire Safety Analysis

**Fire Area ID:** 1-021-U1 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by performance-based approach Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-021-U1 - Aux Building Switchgear Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B	Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-021-U1 - Aux Building Switchgear Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-021-U1 - Aux Building Switchgear Rooms NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-15), Unit 1 Auxiliary Building Switchgear Room Train B (Fire Area 1-021), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression(III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer power operated relief valves (PORVs).</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-15), Unit 1 Auxiliary Building Switchgear Room Train B (Fire Area 1-021), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assembly between room 233 (area 1-021) and 228 (area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-021-U2 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-021-U2 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-021-U2 - Aux Building Switchgear Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B	Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-021-U2 - Aux Building Switchgear Rooms NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-15), Unit 1 Auxiliary Building Switchgear Room Train B (Fire Area 1-021), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression(III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer power operated relief valves (PORVs).</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-15), Unit 1 Auxiliary Building Switchgear Room Train B (Fire Area 1-021), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assembly between room 233 (area 1-021) and 228 (area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-023-U1 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV or aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by {PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-023-U1 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12A, 2004 Edition and NFPA 12A, 1973 Edition. The approach was to determine the applicable code editions for the Halon 1301 systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable code editions</li><li>• The Halon systems were determined to be compliant with the relevant sections of NFPA-12A-2004 and NFPA 12A-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances in against the 2004 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-023-U1 - Aux Building Switchgear Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-023-U1 - Aux Building Switchgear Room NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-17), Unit 1 Non-Rad Side Corridor - Auxiliary Building, EI 121 ft (Fire Area 1-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> <li>• The sprinkler system in room 234 will serve as a water curtain to prevent the passage of a fire through the non-rated steel hatches. Sprinkler systems in the hatch area above and below room 234 will prevent the spread of fire from these areas into Fire Area 1-020.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-19), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer power operated relief valves (PORVs).</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-19), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 235 (area 1-023) and 234 (area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-023-U1 - Aux Building Switchgear Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-28), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-28), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-023-U2 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-023-U2 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-023-U2 - Aux Building Switchgear Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment C Code Compliance Evaluation for NFPA 12A, 2004 Edition, Halon 1301 Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12A, 2004 Edition and NFPA 12A, 1973 Edition. The approach was to determine the applicable code editions for the Halon 1301 systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable code editions</li><li>• The Halon systems were determined to be compliant with the relevant sections of NFPA-12A-2004 and NFPA 12A-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances in against the 2004 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-023-U2 - Aux Building Switchgear Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-023-U2 - Aux Building Switchgear Room NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-17), Unit 1 Non-Rad Side Corridor - Auxiliary Building, EI 121 ft (Fire Area 1-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> <li>• The sprinkler system in room 234 will serve as a water curtain to prevent the passage of a fire through the non-rated steel hatches. Sprinkler systems in the hatch area above and below room 234 will prevent the spread of fire from these areas into Fire Area 1-020.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-19), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer power operated relief valves (PORVs).</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-19), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 235 (area 1-023) and 234 (area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-023-U2 - Aux Building Switchgear Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-28), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-28), Unit 1 Auxiliary Building CRDM Switchgear Room Train B (Fire Area 1-023), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-030-U1 - Aux Building Cable Chase, Rooms 249 & 252  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves, the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performed-based-approach Train A PORV or aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1A/1B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by {PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	

## Fire Safety Analysis

**Fire Area ID:** 1-030-U1 - Aux Building Cable Chase, Rooms 249 & 252

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-030-U1 - Aux Building Cable Chase, Rooms 249 & 252

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 1-030-U1 - Aux Building Cable Chase, Rooms 249 & 252 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-29), Unit 1 Auxiliary Building Cable Chase Train B (Fire Area 1-030), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of the pressurizer PORVs and the transfer relays for the PORVs and the head vent valves.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-29), Unit 1 Auxiliary Building Cable Chase Train B (Fire Area 1-030), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

## Fire Safety Analysis

**Fire Area ID:** 1-030-U2 - Aux Building Cable Chase, Rooms 249 & 252  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-030-U2 - Aux Building Cable Chase, Rooms 249 & 252  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-030-U2 - Aux Building Cable Chase, Rooms 249 & 252	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Licensing Action** Appendix R Exemption (No. 1-29), Unit 1 Auxiliary Building Cable Chase Train B (Fire Area 1-030), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

**Licensing Basis** Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:

- Fire resistant coating on a door has been placed in a surveillance program.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

**Licensing Action** Appendix R Exemption (No. 2-29), Unit 1 Auxiliary Building to Diesel Generator Building Cable Tunnel Train B (Fire Area 1-076), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

**Licensing Basis** Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- Fire resistant coating on a door has been placed in a surveillance program.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

**Licensing Action** Appendix R Exemption (No. 2-30), Unit 1 Auxiliary Building Cable Chase Train B (Fire Area 1-030 Unit 2 Cabling), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)

**Licensing Basis** Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.
- A long term manual action (> 24 hours) can be performed to shift the service water discharge from the circulating water canal to recirculate to the service water pond by manually repositioning the subject valves [QSP16V506-B and QSP16V508-B] as required.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-031-U1 - Aux Building Cable Chase, Rooms 250 & 251  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1A or 1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach Shutdown margin. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 1/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Performance-based approach Steam Generator 1A/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-031-U1 - Aux Building Cable Chase, Rooms 250 & 251  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-031-U1 - Aux Building Cable Chase, Rooms 250 & 251	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance</li></ul>

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: 1-031-U1 - Aux Building Cable Chase, Rooms 250 & 251 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-18), Unit 1 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 1-075), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Fire resistant coating on a door has been placed in a surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-33), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-031), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, and lack of 3 hour fire rated barrier separating redundant trains, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change to be installed as a result of Regulatory Guide (RG) 1.97 will provide a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-33), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-031), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Fire resistant coating on a door has been placed in a surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-031-U1 - Aux Building Cable Chase, Rooms 250 & 251	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-22), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-031), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.
- A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-031-U2 - Aux Building Cable Chase, Rooms 250 & 251  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump or TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored	

## Fire Safety Analysis

**Fire Area ID:** 1-031-U2 - Aux Building Cable Chase, Rooms 250 & 251  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment G	Code Compliance Evaluation for NFPA 15, 2007 Edition, Water Spray Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 15, 2007 Edition and NFPA 15, 1973 Edition. The approach was to determine the applicable code editions for the water spray systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The water spray systems were determined to be compliant with the relevant sections of NFPA 15-2007 and NFPA 15-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1973 Edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have been provided with justifications</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-031-U2 - Aux Building Cable Chase, Rooms 250 & 251

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 1-031-U2 - Aux Building Cable Chase, Rooms 250 & 251 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-18), Unit 1 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 1-075), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Fire resistant coating on a door has been placed in a surveillance program.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-33), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-031), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, and lack of 3 hour fire rated barrier separating redundant trains, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change to be installed as a result of Regulatory Guide (RG) 1.97 will provide a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-33), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-031), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Fire resistant coating on a door has been placed in a surveillance program.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-031-U2 - Aux Building Cable Chase, Rooms 250 & 251	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-22), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-031), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.
- A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-034 - Train B Electrical Pen Room & Filtration System  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using performed-based approach with one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using performed-based approach Train A PORV or block valve and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring the Loop 1 and Loop 2 RCPs are shut off. Performance-based approach for spurious auxiliary spray. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.</li> <li>Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-034 - Train B Electrical Pen Room & Filtration System  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and Pressurizer Heater Group A for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1A/1B. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1. 4. RCS Temperature - Performance-based approach RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-034 - Train B Electrical Pen Room & Filtration System  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	<ul style="list-style-type: none"><li>• Unit 1: Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li><li>• Unit 2: Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li></ul>	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train A component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-034 - Train B Electrical Pen Room & Filtration System	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-35), Unit 1 Aux. Building, Electrical Pen. Rm Train B and Pen. Room Filtration System Equip. Rm (Fire Area 1-034), Enclosure of one train with a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to restore the control of the PORVs and reactor head vent valves, isolation RCS and pressurizer sample line valves, pre-fire alignment of CCW heat exchanger valves and the reestablishment of charging pump miniflow.</li> <li>• Instrumentation cable for pressurizer pressure transmitter Q1B31PT0455-P1 has been rerouted out of Fire Area 1-034 so that pressurizer pressure signal from at least one pressure transmitter, Q1B31PT0455-P1, is available.</li> <li>• Isolation valve Q1P16MOV130B-B will be maintained in the open position by racking out the power at the MCC breaker whenever CCW pump 1C and CCW heat exchanger 1C are out of service.</li> <li>• A design modification installed disconnect breakers in the power supply circuits of charging pump isolation valves outside the electrical penetration room.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

7.2 Vital Auxiliaries – Service Water	<ul style="list-style-type: none"> <li>Unit 1: Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li> <li>Unit 2: Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li> </ul>	
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"> <li>Unit 1: Train B component cooling water is provided with non-essential loads isolated.</li> <li>Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated</li> </ul>	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-035 - Train A Electrical Pen Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment F Code Compliance Evaluation for NFPA 14, 2007 Edition, Standard for Installation of Standpipes and Hose Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 14, 2007 Edition. The approach was to determine the applicable code edition for the applicable systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Standpipe and hose systems were determined to be compliant with the relevant sections of NFPA 14, 2007 Edition, with the exception of the non-compliances identified in the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1976.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	1-035 - Train A Electrical Pen Rooms Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-37), Unit 1 Auxiliary Building, Electrical Penetrations Room Train A (Fire Area 1-035), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain the control of the pressurizer power operated relief valves and the reestablishment of charging pump miniflow.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> <li>• A design modification to install disconnect breakers in the power supply circuits of charging pump isolation valves outside the electrical penetration room has been completed..</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-039 - Fuel Storage & Storage Rack Pits  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump aligned to Train A or Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A / Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A/Train B charging pump (s) or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump or TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-039 - Fuel Storage & Storage Rack Pits	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-040-U1 - Cable Spreading Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs. CCW to RCP thermal barriers are isolated using the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring the Loop 1 and Loop 2 RCPs are shut off.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1A.	
6 Process Monitoring	Essential processes are monitored by dedicated instruments at the hot shutdown panel.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

## Fire Safety Analysis

**Fire Area ID:** 1-040-U1 - Cable Spreading Room

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of the manual carbon dioxide suppression system will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-040-U1 - Cable Spreading Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the two code editions
- The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations
- Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

---

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the applicable codes
- The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations
- Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-040-U1 - Cable Spreading Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

6-1 of the report

- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

---

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
----------------------------------	--

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

---

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
----------------------------------	---

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	Yes
--------------------------------	-----

<b>Summary</b>	Purpose:
----------------	----------

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,

## Fire Safety Analysis

**Fire Area ID:**

1-040-U1 - Cable Spreading Room

**Compliance Basis:**

NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluations**

- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-040-U1 - Cable Spreading Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-040-U2 - Cable Spreading Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump aligned to Train A / Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A or Train B MDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-040-U2 - Cable Spreading Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Performance-based approach electrical power is supplied by off-site power via SUT 2A/SUT 2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of the manual carbon dioxide suppression system will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-040-U2 - Cable Spreading Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

6-1 of the report

- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

---

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
----------------------------------	--

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
----------------------------------	---

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	Yes
--------------------------------	-----

<b>Summary</b>	Purpose:
----------------	----------

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,

## Fire Safety Analysis

**Fire Area ID:**

1-040-U2 - Cable Spreading Room

**Compliance Basis:**

NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluations**

- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-040-U2 - Cable Spreading Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-041-U1 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the performance-based approach Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAPW pump supplying Steam Generator 1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-041-U1 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Performance-based approach electrical power is supplied by diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-041-U1 - Train A Switchgear & Load Center Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001 Fire Barrier Penetration Seal Limiting Design Parameter Evaluation
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>Evaluate various penetration seals which, as a result of plant walkdowns of as built configurations, exhibited one or more Limiting Design Parameters (LDPs) which were outside limits previously established via qualification test reviews.</p> <p>Bases for Acceptability:</p> <p>The basis of the evaluation was to establish the acceptability of the field established configurations through either:</p> <ul style="list-style-type: none"> <li>• Utilizing engineering judgment based on additional reviews of test reports to justify the LDP in question;</li> <li>• Refinement of field judgments through review of design drawing/documentation; or</li> <li>• Establishing additional technical bases which allowed reapplication of acceptance criteria for LDPs.</li> </ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those</p>

## Fire Safety Analysis

**Fire Area ID:** 1-041-U1 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 1-041-U1 - Train A Switchgear & Load Center Rooms Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-23), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-23), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria), which was approved by the NRC in a letter dated 09/10/1986: .</p> <ul style="list-style-type: none"><li>• The construction and the installation of door/transom assemblies between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-25), Unit 1 Aux. Building, EI 139 ft (Fire Area 1-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• The construction and the installation of door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li><li>• The sprinkler system existing in room 345 will serve the purpose of a water curtain to prevent the passage of fire from Area 1-042 to the adjacent fire areas via the non-rated steel hatches.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

Fire Area ID: 1-041-U1 - Train A Switchgear & Load Center Rooms Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-16), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change, installed as a result of Regulatory Guide (RG) 1.97, provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 2-16), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"><li>• Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-041-U1 - Train A Switchgear & Load Center Rooms	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

### Licensing Action

Appendix R Exemption (No. 2-17), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-042 Unit 2 Cabling), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-041-U2 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 1-041-U2 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-041-U2 - Train A Switchgear & Load Center Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001 Fire Barrier Penetration Seal Limiting Design Parameter Evaluation
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>Evaluate various penetration seals which, as a result of plant walkdowns of as built configurations, exhibited one or more Limiting Design Parameters (LDPs) which were outside limits previously established via qualification test reviews.</p> <p>Bases for Acceptability:</p> <p>The basis of the evaluation was to establish the acceptability of the field established configurations through either:</p> <ul style="list-style-type: none"><li>• Utilizing engineering judgment based on additional reviews of test reports to justify the LDP in question;</li><li>• Refinement of field judgments through review of design drawing/documentation; or</li><li>• Establishing additional technical bases which allowed reapplication of acceptance criteria for LDPs.</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems

<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>
----------------	---

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those</p>

## Fire Safety Analysis

**Fire Area ID:** 1-041-U2 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 1-041-U2 - Train A Switchgear & Load Center Rooms Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-23), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-23), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria), which was approved by the NRC in a letter dated 09/10/1986: .</p> <ul style="list-style-type: none"><li>• The construction and the installation of door/transom assemblies between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-25), Unit 1 Aux. Building, EI 139 ft (Fire Area 1-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• The construction and the installation of door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li><li>• The sprinkler system existing in room 345 will serve the purpose of a water curtain to prevent the passage of fire from Area 1-042 to the adjacent fire areas via the non-rated steel hatches.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-041-U2 - Train A Switchgear & Load Center Rooms NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-16), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change, installed as a result of Regulatory Guide (RG) 1.97, provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-16), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"> <li>• Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-041-U2 - Train A Switchgear & Load Center Rooms	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

### Licensing Action

Appendix R Exemption (No. 2-17), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-042 Unit 2 Cabling), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-042-U1 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by performance-based approach isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the performance-based approach Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1C. Main feed is performance-based approach isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Performance-based approach pressurizer level is monitored. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-042-U1 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Performance-based approach electrical power is supplied by diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-042-U1 - Aux Building Hallways & Corridor	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>

<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those</p>

## Fire Safety Analysis

**Fire Area ID:** 1-042-U1 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, TE-BE-03-9902-002, Technical Evaluation in Support of FL 86-10 for DCP 03-1-9902 Install Fire Rated M.I. Cables in Fire Areas 1-013; 1-042, 2-013; and 2-042 for Control Circuits Associated With DG 1-2A and DG 1C

**Inactive** Yes

**Functionally Equivalent** No

**Adequate for the Hazard** No

**Summary** Purpose:

The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.

Bases for Acceptability:

The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on

- full area detection and suppression;
- limited fire hazards;
- an assessment of in situ combustibles; and
- the substantial construction of the fire area boundary.

To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr

## Fire Safety Analysis

**Fire Area ID:** 1-042-U1 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluations**

rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-042-U1 - Aux Building Hallways & Corridor NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-17), Unit 1 Non-Rad Side Corridor - Auxiliary Building, EI 121 ft (Fire Area 1-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> <li>• The sprinkler system in room 234 will serve as a water curtain to prevent the passage of a fire through the non-rated steel hatches. Sprinkler systems in the hatch area above and below room 234 will prevent the spread of fire from these areas into Fire Area 1-020.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-23), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria), which was approved by the NRC in a letter dated 09/10/1986: .</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-25), Unit 1 Aux. Building, EI 139 ft (Fire Area 1-042), Enclosure of one train by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-1-9901, DCP 03-1-9902, DCP 03-2-9906, DCP 90-1-6905, Re-analysis supported by Generic Letter 86-10 evaluation, Exemption for the use of the fire-rated cables, and Operator action for aligning the backup Nitrogen to the PORVs. However, note that APC correspondence and NRC SER regarding this exemption request do not credit Kaowool raceway barriers.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

Licensing Basis	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>For the non-fire rated hatch covers:</p> <ul style="list-style-type: none"><li>• Suppression system in room 163 in the area of the subject steel hatch cover</li><li>• Analysis of safe shutdown showed that physical separation was adequate</li><li>• Detection system provided in rooms 163 and 103</li><li>• Sprinkler systems in room 345 and 454 will serve the purpose of a water curtain to prevent the passage of fire through the non-rated steel hatch.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency</p>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-042-U1 - Aux Building Hallways & Corridor NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
	evaluation(s).	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-16), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"> <li>• Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-17), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-042 Unit 2 Cabling), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-17), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-042 Unit 2 Cabling), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-042-U1 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Previously Approved Engineering Evaluations**

- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

### Licensing Action

Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)

### Licensing Basis

Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):

- The MI cable support span is within the fire test configurations.
- The materials for the MI cable supports are bounded by the fire test configurations.
- The MI cable installation hardware is in accordance with the fire test configurations.
- The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.
- The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.
- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-042-U2 - Aux Building Hallways & Corridor	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>

<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No

## Fire Safety Analysis

**Fire Area ID:** 1-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the applicable codes
- The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations
- Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance

## Fire Safety Analysis

**Fire Area ID:** 1-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, TE-BE-03-9902-002, Technical Evaluation in Support of FL 86-10 for DCP 03-1-9902 Install Fire Rated M.I. Cables in Fire Areas 1-013; 1-042, 2-013; and 2-042 for Control Circuits Associated With DG 1-2A and DG 1C

**Inactive** Yes

**Functionally Equivalent** No

**Adequate for the Hazard** No

**Summary** Purpose:

The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.

Bases for Acceptability:

The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on

- full area detection and suppression;
- limited fire hazards;
- an assessment of in situ combustibles; and
- the substantial construction of the fire area boundary.

To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr

## Fire Safety Analysis

**Fire Area ID:**

1-042-U2 - Aux Building Hallways & Corridor

**Engineering Evaluations**

**Compliance Basis:**

NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-042-U2 - Aux Building Hallways & Corridor NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-17), Unit 1 Non-Rad Side Corridor - Auxiliary Building, EI 121 ft (Fire Area 1-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating rooms 235 (Fire Area 1-023) and 234 (Fire Area 1-020), and the configuration of the in-situ combustibles in these fire areas, provide reasonable assurance that fire would not propagate into adjacent fire areas.</li> <li>• The sprinkler system in room 234 will serve as a water curtain to prevent the passage of a fire through the non-rated steel hatches. Sprinkler systems in the hatch area above and below room 234 will prevent the spread of fire from these areas into Fire Area 1-020.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-23), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria), which was approved by the NRC in a letter dated 09/10/1986: .</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-25), Unit 1 Aux. Building, EI 139 ft (Fire Area 1-042), Enclosure of one train by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-1-9901, DCP 03-1-9902, DCP 03-2-9906, DCP 90-1-6905, Re-analysis supported by Generic Letter 86-10 evaluation, Exemption for the use of the fire-rated cables, and Operator action for aligning the backup Nitrogen to the PORVs. However, note that APC correspondence and NRC SER regarding this exemption request do not credit Kaowool raceway barriers.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

	evaluation(s).	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-16), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"> <li>• Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-17), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-042 Unit 2 Cabling), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-17), Unit 1 Auxiliary Building, EI 139 ft (Fire Area 1-042 Unit 2 Cabling), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Based on the construction, the installation of the door/transom assembly between rooms 346 (area 1-041) and 345 (area 1-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Previously Approved Engineering Evaluations**

- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

### Licensing Action

Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)

### Licensing Basis

Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):

- The MI cable support span is within the fire test configurations.
- The materials for the MI cable supports are bounded by the fire test configurations.
- The MI cable installation hardware is in accordance with the fire test configurations.
- The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.
- The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.
- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-053 - Aux Building Elevator Machine Room No. 2  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>• Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> <li>• Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>• Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>• Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Fire Area ID:** 1-053 - Aux Building Elevator Machine Room No. 2  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-054 - Aux Building Elevator Machine Room No. 1 and Elevator No. 1 Shaft  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump aligned to Train A / Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A/Train B charging pump (s) or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"><li>• Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li><li>• Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li></ul>	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in Containment. There are no automatic suppression systems in Containment. Equipment is qualified for harsh environment, including water spray and vital equipment is located above the sump submergence level that would be expected during fire suppression activities. Therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-075-U1 - Unit 1 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 1-075-U1 - Unit 1 Cable Tunnel - Train A

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train B ,service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-075-U1 - Unit 1 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-075-U1 - Unit 1 Cable Tunnel - Train A NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-18), Unit 1 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 1-075), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provided a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-18), Unit 1 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 1-075), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Fire resistant coating on a door has been placed in a surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-33), Unit 1 Auxiliary Building Cable Chase Train A (Fire Area 1-031), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Fire resistant coating on a door has been placed in a surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-075-U1 - Unit 1 Cable Tunnel - Train A	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-23), Unit 1 Auxiliary Building to Diesel Generator Building Cable Tunnel Train A (Fire Area 1-075), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.
- A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-075-U2 - Unit 1 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-075-U2 - Unit 1 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-075-U2 - Unit 1 Cable Tunnel - Train A	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	1-075-U2 - Unit 1 Cable Tunnel - Train A NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-18), Unit 1 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 1-075), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provided a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 1-076-U1 - Unit 1 Cable Tunnel - Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1A/1B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored..	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	

## Fire Safety Analysis

**Fire Area ID:** 1-076-U1 - Unit 1 Cable Tunnel - Train B

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-076-U2 - Unit 1 Cable Tunnel - Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 1-076-U2 - Unit 1 Cable Tunnel - Train B Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-29), Unit 1 Auxiliary Building Cable Chase Train B (Fire Area 1-030), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Fire resistant coating on a door has been placed in a surveillance program.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-30), Unit 1 Auxiliary Building to Diesel Building Cable Tunnel Train B (Fire Area 1-076), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual operator actions can be performed to regain control of the pressurizer PORVs and the transfer relays for the PORVs and the head vent valves.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-077 - Condensate Storage Tank  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>• Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> <li>• Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>• Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>• Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	

## Fire Safety Analysis

SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-077 - Condensate Storage Tank  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> <li>Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-080 - Low Voltage Switchyard - Unit 1  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>• Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> <li>• Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>• Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>• Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. Each outdoor deluge system provides local protection for individual transformers, and are designed (using curbs, etc.) so water will remain in the vicinity of the affected equipment. Therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-081-U1 - Turbine Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-081-U1 - Turbine Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-081-U1 - Turbine Building Battery Room

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Drainage capacity in the general Turbine Building area exceeds expected fire suppression flows. Local hazards protected by sprinkler or water spray systems have sufficient curbing and discharge of manual suppression water in adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-082 - Turbine Building Lube Oil Storage Room

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment K Code Compliance Evaluation for NFPA 30, 2008 Edition, Flammable and Combustible Liquids Code

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 30, 2008 Edition. The approach was to determine the applicable code edition for flammable & combustible liquids, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Flammable and combustible liquids were determined to be compliant with the relevant sections of NFPA-30-2008, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were resolved in Appendix D, which vetted the 2008 edition non-compliances against the FNP code of record edition of 1972.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Drainage capacity in the general Turbine Building area exceeds expected fire suppression flows. Local hazards protected by sprinkler or water spray systems have sufficient curbing and discharge of manual suppression water in adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-086 - Turbine Building Auxiliary Steam Generator  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

## Fire Safety Analysis

**Fire Area ID:** 1-090 - Aux Building Combustible Storage & Filter Unit Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-092 - Drumming Station & Storage & Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-092 - Drumming Station & Storage & Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-092 - Drumming Station & Storage & Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment K Code Compliance Evaluation for NFPA 30, 2008 Edition, Flammable and Combustible Liquids Code

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 30, 2008 Edition. The approach was to determine the applicable code edition for flammable & combustible liquids, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Flammable and combustible liquids were determined to be compliant with the relevant sections of NFPA-30-2008, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were resolved in Appendix D, which vetted the 2008 edition non-compliances against the FNP code of record edition of 1972.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** 1-094 - Aux Building Combustible Storage Room  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-095 - Aux Building Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-095 - Aux Building Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, Acceptability Determination of Penetration Seals #24-100-32; 09-139-9; and 02-139-29

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

The purpose of this evaluation is to document the acceptability of FNP Unit 1 Penetration Seals #24-100-32, 09-139-9, and 02-139-29 as 3-hour rated fire barriers.

Bases for Acceptability:

The evaluation demonstrates that the penetrations have been evaluated as acceptable 3-hour rated penetrations based on the features of construction as compared to test results furnished by various recognized industry tests.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the applicable codes
- The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations
- Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

## Fire Safety Analysis

**Fire Area ID:** 1-095 - Aux Building Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Summary**

Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary**

Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-095 - Aux Building Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

<b>Licensing Action</b>	Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• The fire severity in the affected rooms is less than 30 minutes for all cases.</li><li>• A sprinkler system is installed in rooms 161, 179, 2161, and 2179</li><li>• Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

### Other Passive Features

## Fire Safety Analysis

**Fire Area ID:** 1-096 - Aux Building Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

## Fire Safety Analysis

**Fire Area ID:** 1-096 - Aux Building Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 1-096 - Aux Building Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

**Licensing Action** Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

**Licensing Basis** Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:

- The fire severity in the affected rooms is less than 30 minutes for all cases.
- A sprinkler system is installed in rooms 161, 179, 2161, and 2179
- Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-097 - Filter Hatch Room & Combustible Storage Area  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. ## Fire Safety Analysis

**Fire Area ID:** 1-098 - Caskwash Storage & Combustible Storage Area  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-098 - Caskwash Storage & Combustible Storage Area	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.3 Deterministic Approach

**Fire Area ID:** 1-098 - Caskwash Storage & Combustible Storage Area  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-DU-DGRWIS-B - Diesel Building to RWIS Ductbank, Unit 1, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-DU-DGRWIS-B - Diesel Building to RWIS Ductbank, Unit 1, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-DU-DGSWIS-B-U1 - Diesel Building to SWIS Ductbank, Unit 1, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-DU-DGSWIS-B-U1 - Diesel Building to SWIS Ductbank, Unit 1, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-DU-DGSWIS-B-U1 - Diesel Building to SWIS Ductbank, Unit 1, Train B	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-DU-DGVB-B - Diesel Building to Valve Box Ductbanks, Train B  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained in this area due to embedded conduits. Cables in embedded conduits are protected from adverse conditions occurring due to fire suppression effects. Therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-S01 - Stairwell No. 1  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001 Fire Barrier Penetration Seal Limiting Design Parameter Evaluation	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluate various penetration seals which, as a result of plant walkdowns of as built configurations, exhibited one or more Limiting Design Parameters (LDPs) which were outside limits previously established via qualification test reviews.</p> <p>Bases for Acceptability:</p> <p>The basis of the evaluation was to establish the acceptability of the field established configurations through either:</p> <ul style="list-style-type: none"><li>• Utilizing engineering judgment based on additional reviews of test reports to justify the LDP in question;</li><li>• Refinement of field judgments through review of design drawing/documentation; or</li><li>• Establishing additional technical bases which allowed reapplication of acceptance criteria for LDPs.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-S01 - Stairwell No. 1	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

		Previously Approved Engineering Evaluations
<b>Fire Area ID:</b>	1-S01 - Stairwell No. 1	
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-38), Unit 1 Auxiliary Building, Elevations 100, 127, 139, 155, and 175 ft. (Fire Area 1-006), lack of separation of cables and equipment and associated nonsafety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of a rated 3 hour boundary between fire areas 1-006 and 1-S01, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>A non fire-rated, watertight door # 170 exists between fire area 1-006, room 190 and fire area 1-S01, Stairwell # 1; and a non fire-rated, pressure tight door # 330 exists between fire area 1-006, room 241 and fire area 1-S01, Stairwell # 1.</p> <ul style="list-style-type: none"><li>• These doors are normally maintained closed.</li><li>• Smoke detection is provided in rooms on both sides of these doors. These system alarms locally and are annunciated in the main control room and will provide early warning of a pending fire condition, prompting a fire brigade response.</li><li>• An automatic fire suppression system is provided in room 190.</li><li>• Portable extinguishers and fire hose cabinets are available outside of the stairwell # 1 at each elevation except 175 feet for fire brigade's use.</li><li>• The combustible loading in room 241 (main steam valve room) is less than 30 minutes and access to this area during plant operation is restricted. Based on the configuration and fire protection provided, a fire on either side of these doors will not propagate to the adjacent fire area.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 1-S02 - Stairwell No. 2  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>Unit 1: Normal letdown is isolated using orifice isolation, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> <li>Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-S02 - Stairwell No. 2  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with Train A PORV for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. ### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-S02 - Stairwell No. 2	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, U-732257 Qualification of Three-Hour Rated Stairwell Enclosures
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation was to demonstrate the acceptability of three Promat H cement board enclosures constructed inside stairwells (two enclosures in Unit 1, Stairwell #2, and one enclosure in Unit 2, Stairwell #2) to provide separation and protection for various safety related circuits running through the stairs.</p> <p>Bases for Acceptability:</p> <p>The evaluation demonstrates that the three enclosures are functionally equivalent to three-hour fire resistance rated enclosures by comparing the FNP installations to Promat H assemblies that passed the three-hour fire resistance rating ASTM E-119 test.</p>

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-S02 - Stairwell No. 2	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	1-S02 - Stairwell No. 2 Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-22), Unit 1 Auxiliary Building Stairwell No. 2 (Fire Area 1-S02), Automatic fire suppression (III.G.2.c criteria). lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Redundant safe shutdown cabling in Fire Area 1-S02 has been enclosed in a fire barrier</li> <li>• Early warning smoke detection system is provided.</li> <li>• The in-situ combustible fire loading is low and consists only of cable insulation with a maximum fire severity of less than one-hour.</li> <li>• All non-safe shutdown cables in this fire area are enclosed in conduit.</li> </ul> <p>The elimination of Kaowool fire barriers in this fire area is resolved by fire rated enclosures per DCP 03-1-9907 or fire area re-analysis/operator action.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805, Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-S02 - Stairwell No. 2  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 1-S08 - Stairwell No. 8  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Fire Area ID:** 1-S08 - Stairwell No. 8  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 1-S08 - Stairwell No. 8  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-S10 - Stairwell No. 10  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using {Train A / Train B charging pump, swing charging pump via Train A/Train B power} aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-S10 - Stairwell No. 10  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-S10 - Stairwell No. 10	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

**Licensing Action** Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

**Licensing Basis** Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-SVB1-A - Service Water Valve Box, 1-SVB1, Train A  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train B component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	<ul style="list-style-type: none"><li>• Unit 1: Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.</li><li>• Unit 2: Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.</li></ul>	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-SVB1-A - Service Water Valve Box, 1-SVB1, Train A  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-SVB1-B - Service Water Valve Box, 1-SVB1, Train B  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>
