### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.3 Vital Auxiliaries – Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 1: Train A component cooling water is provided with non-essential loads isolated.</li><li>• Unit 2: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries – HVAC	<ul style="list-style-type: none"><li>• Unit 1: Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.</li><li>• Unit 2: Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.</li></ul>	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-SVB3-A - Service Water Valve Box, 1-SVB3, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** 1-SVB4-A - Service Water Valve Box, 1-SVB4, Train A  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	

## Fire Safety Analysis

**Fire Area ID:** 1-SVB4-A - Service Water Valve Box, 1-SVB4, Train A

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-SVB4-A - Service Water Valve Box, 1-SVB4, Train A

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-TB-U1 - Turbine Building General Area  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump aligned to Train A / Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal charging using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the performance-based approach Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 1A/1B/1C. Performance-based approach main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-TB-U1 - Turbine Building General Area  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Drainage capacity in the general Turbine Building area exceeds expected fire suppression flows. Local hazards protected by sprinkler or water spray systems have sufficient curbing and discharge of manual suppression water in adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-TB-U1 - Turbine Building General Area  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 1-TB-U2 - Turbine Building General Area  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 1-TB-U2 - Turbine Building General Area  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Drainage capacity in the general Turbine Building area exceeds expected fire suppression flows. Local hazards protected by sprinkler or water spray systems have sufficient curbing and discharge of manual suppression water in adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 1-TB-U2 - Turbine Building General Area  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-001 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Fire Area Definition**

Fire Zone ID	Description	Elevation(s)
2101	2101 Waste Gas Decay Tank Room	
2102	2102 Valve Compartment Room	
2103	2103 Corridor	
2104	2104 Passageway to Unit 1	
2105	2105 Catalytic H2 Recombiner 1A Room	
2106	2106 Catalytic H2 Recombiner 1B Room	
2108	2108 Waste Monitor Tank Room	
2109	2109 Waste Monitor Tank Pump Room	
2110	2110 Monitor Control Panel Room	
2111	2111 Containment Spray Pump Room 1A	
2112	2112 Access to Tendon Access Gallery	
2113	2113 Valve Encapsulation	
2114	2114 Pipe Chase	
2115	2115 Hallway	
2118	2118 Floor Drain Tank Room	
2119	2119 Waste Holdup Tank Room	
2120	2120 Corridor	
2121	2121 Floor Drain Tank Pump Room	
2122	2122 Waste Evaporator Feed Pump Room	
2123	2123 Pipe Chase	
2124	2124 Valve Encapsulation	
2125	2125 Containment Spray Pump Room 1B	
2126	2126 Pipe Chase	
2127	2127 Pipe Chase	
2128	2128 RHR Heat Exchanger Room	
2129	2129 RHR Low Head Pump Room	
2130	2130 Pipe Chase	
2131	2131 RHR Low Head Pump Room	
2169	2169 Duct and Pipe Chase	
2183	2183 Tendon Access Gallery Entrance	
2184	2184 Piping Penetration Room, El. 100'-0"	
2196	2196 Access to Tendon Access Gallery	
2223	2223 Piping Penetration Room, El. 121'-0"	

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 2-001 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>• Unit 2: Subcritical conditions are maintained by performance-based approach isolating the VCT to prevent boron dilution and by performance-based approach charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.</li> <li>• Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>• Unit 2: RCS inventory is controlled using Train B charging pump or swing charging pump aligned to the RWST.</li> <li>• Unit 1: RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>• Unit 2: Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve.</li> <li>• Unit 1: Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>• Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.</li> <li>• Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-001 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	<ul style="list-style-type: none"> <li>Unit 2: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.</li> <li>Unit 1: Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.</li> </ul>	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 2: Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.</li> <li>Unit 1: Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW or Train B MDAFW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. **Fire Area ID:** 2-001 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"><li>• Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B. 2. Performance-based approach 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li><li>• Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li></ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-001 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	ENGDOC, DOEJ-SM-03-0415-001    Applicability of NFPA 80 Door Closer Requirements	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation addresses a select number of fire doors that occasionally may not automatically latch closed due to "abnormal air pressure".</p> <p>Bases for Acceptability:</p> <p>The specific fire doors cited are PA101, 201 and 497. The evaluation justifies the door latching deviation by taking credit for plant staff that ensure all fire doors are closed after entry or egress.</p>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001    Fire Barrier Penetration Seal Limiting Design Parameter Evaluation	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluate various penetration seals which, as a result of plant walkdowns of as built configurations, exhibited one or more Limiting Design Parameters (LDPs) which were outside limits previously established via qualification test reviews.</p> <p>Bases for Acceptability:</p> <p>The basis of the evaluation was to establish the acceptability of the field established configurations through either:</p> <ul style="list-style-type: none"> <li>• Utilizing engineering judgment based on additional reviews of test reports to justify the LDP in question;</li> <li>• Refinement of field judgments through review of design drawing/documentation; or</li> <li>• Establishing additional technical bases which allowed reapplication of acceptance criteria for LDPs.</li> </ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A    Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-001 - Aux Building

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluations**

- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-001 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 2-36), Unit 2 Auxiliary Building Elevations 83 ft., 100 ft., 121 ft. (fire area 2-001) Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression and detection, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain control of the instrument air system, one of the three main steam atmospheric relief valves, charging pump miniflow and the pressurizer PORVs and block valves.</li><li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li></ul> <p>For lack of area wide smoke detection:</p> <ul style="list-style-type: none"><li>• The rooms in fire area 2-001 without detection (2112, 2114, 2115, 2123, 2126, 2127, 2130, 2169, and 2196) contain little or no combustible material and contain no safe shutdown cable or equipment.</li><li>• One train of redundant cables is provided with fire barriers consisting of two 1-inch layers of Kaowool blanket with overall layer of Zetex cloth.</li></ul> <p>For Initiation of Safety Signals:</p> <ul style="list-style-type: none"><li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li></ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9930 and fire area re-analysis.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-001 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 2-37), Unit 2 Auxiliary Building, Elevations 100, 121, 130, 139, 155, and 184 ft. (Fire Area 2-004) ), Enclosure of one train with a 1 hour rated fire barrier with automatic fire suppression and detection (III.G.2.c criteria)
<b>Licensing Basis</b>	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression and lack of separation of redundant trains by 3 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>For power distribution system:</p> <ul style="list-style-type: none"> <li>• The redundant MCCs 2A and 2B are separated by a 2-ft-thick reinforced concrete floor at el 139 ft - 0 in.</li> <li>• Unsealed penetrations have been reviewed and will not affect separation.</li> <li>• Minimum horizontal separation between components is approximately 66 feet with complete automatic suppression coverage at el 121 ft - 0 in.</li> <li>• The redundant dc distribution panels 2C and 2F are separated by a 2-ft-thick reinforced concrete floor at el 139 ft.</li> <li>• The minimum horizontal separation between these redundant panels is approximately 55 ft and has complete automatic suppression coverage at el 121 ft - 0 in.</li> <li>• A smoke detection system is installed in all rooms containing the subject equipment.</li> <li>• Manual hose stations, portable extinguishers, and portable smoke removal equipment are available for use on the subject elevations.</li> <li>• Manual actions can be performed to establish control of the atmospheric relief valves by closing the manual air vent valve to bleed off air from the diaphragm of the valve actuator, and thus control steam generator pressure and reactor coolant system temperature with the use of the manually controlled atmospheric relief valves.</li> </ul> <p>For Instrumentation - condensate water storage tank level indication</p> <ul style="list-style-type: none"> <li>• Redundant cables are separated by two, 2-ft-thick reinforced concrete floors at el 139 ft - 0 in. and 155 ft - 0 in. Unsealed penetrations have been reviewed and will not affect the separation.</li> <li>• The Train-B cabling at el 121 ft - 0 in. is provided with automatic fixed suppression over 95 percent of its route.</li> <li>• A smoke detection system is installed in all rooms containing the subject cabling.</li> <li>• Manual hose stations, portable carbon dioxide extinguishers, and portable smoke removal equipment are available for use on the subject elevations.</li> </ul> <p>For instrument air - PORVs:</p> <ul style="list-style-type: none"> <li>• Redundant cables are separated by a 2-ft-thick reinforced concrete floor at el 121 ft - 0 in. and 139 ft - 0 in.</li> <li>• Unsealed penetrations in the subject floors have been reviewed</li> <li>• Train A cables have full suppression coverage on el 100 ft - 0 in.</li> <li>• Train B cables have full suppression coverage on el 121 ft - 0 in.</li> <li>• Smoke detection system is installed in all rooms containing the subject cabling.</li> <li>• Manual hose stations and portable carbon dioxide extinguishers are available for use on the subject elevations.</li> </ul> <p>For Auxiliary Feedwater:</p> <ul style="list-style-type: none"> <li>• The 2-h provided by battery power to the turbine driven auxiliary feedwater UPS is adequate for existing procedures for manual operation to be implemented.</li> </ul> <p>For HVAC - battery room ventilation:</p> <ul style="list-style-type: none"> <li>• The requirement for battery and battery charger room ventilation is a long term requirement.</li> <li>• Either portable ventilation equipment will be installed in the effected room(s) or</li> <li>• The damaged ventilation system will be repaired within 20 hours of post-fire hot shutdown initiation to insure that battery room hydrogen concentrations do not exceed acceptable limits.</li> </ul> <p>For steam release (cooldown):</p>

## Fire Safety Analysis

**Fire Area ID:** 2-001 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Previously Approved Engineering Evaluations**

- Manual action can be performed to establish manual control of the atmospheric relief valves by closing the manual air vent valve to bleed off air from the diaphragm of the valve actuator.

For Service Water:

- A long term manual action (greater than 24 h) can be performed to shift the service water discharge from the river and recirc. to the service water pond.

For neutron flux monitoring:

- Configuration of redundant equipment cables and equipment with respect to barriers would limit the fire to one train of equipment.
- Unsealed penetrations in the subject floor slab have been reviewed and will not affect the separation afforded by the concrete floor.

For boration/makeup, depressurization, and RCP seal integrity:

- Modification to provide a fire-rated barrier for Train-A raceways ADD1C-, ADD18A, and ADD21A.
- Full suppression coverage is provided in rooms 2163, 2162, 2161, 2160, and 2175
- Cables are separated by 2-ft-thick reinforced concrete except in room 2155 where there is 24 ft of separation with no intervening combustibles.
- Unsealed penetrations in the subject walls have been reviewed.
- A smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations, portable CO, extinguishers, and portable smoke removal equipment are available for use on this elevation.
- Heat collectors have been installed on all sidewall sprinkler heads in room 2161.
- Modification is to provide a fire-rated barrier for the Train-B charging pump room cooler power cable (Raceways BFD02B, BFD03B, and BFD06B) where this cable is in close proximity to redundant Train-A cables.
- Automatic fire suppression system is provided.
- The blackout near Col. 20 which communicates between elevation 100 ft and 121 ft. will be sealed.
- EI 100 ft. and 121 ft - Automatic suppression and detection systems provided for the subject Train-B cables.
- Cables are separated by a 2-ft-thick reinforced concrete slab floor at el 121 ft - 0 in.
- Unsealed penetrations in the floor slab have been reviewed
- Raceways BFD2GD, BFD21B, BHF457, and BHF42 have been provided with a fire barrier in room 2186, to ensure that a source of borted makeup water is available from the RWST and will not require any manual operator action.
- The cabling for LCV115D has been protected by the fire barrier installed in the modification above and will not fail in the closed position.

For Smoke Detection:

- Smoke detection has been added to Room 2342 (spent fuel pool pump room).
- All cabling in this pipe chase (room 2341) is enclosed in conduit.
- The pipe chase has no in situ combustible.
- The pipe chase exits the auxiliary building below grade.
- This transition from room 2608 to room 2341 has a concrete wall with water tight penetrations.
- There is no redundant safe-shutdown cabling in room 2341.
- Low in situ combustible loading and the very low probability of a transient combustible being introduced.

For reactor coolant boundary integrity:

- Manual action can be performed to remove power from all cables in the shared raceway. This can be accomplished by opening the supply breaker on 125 V-dc switchgear 2A for 125 V-dc distribution panel 2C.

To summarize manual actions and licensee commitments:

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-001 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Manual operator actions can be performed to regain control of the transfer relays associated with the PORVs and the reactor head vent valves, restoration of the battery room ventilation system, manual control of the TDAFW pump, manual control of one main steam atmospheric relief valve, manual service water valve line up to the service water pond, and the isolation or RCS and pressurizer sampling line isolation valves.

- Licensee has also committed to install heat collectors on the sidewall mounted sprinkler/spray nozzles in room 2161, seal a floor slab blackout on elevation 121 feet - 0 inches and install a raceway fire barrier in the boric acid room 2186.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9925, DCP 03-2-9927, DCP 03-2-9930, and DCP 03-2-9899.

The portion of this exemption that support separation within the fire area are no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

A non fire-rated steel hatch exists between rooms 2163 (fire area 2-004) and room 2103 (fire area 2-001). That portion of the exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)

### Licensing Basis

Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:

All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:

- Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.
- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 2-004-U1 - Aux Building  
**Fire Zone ID:** 2307-U1 - 2307 Valve Compartment Room

### Systems and Features

#### Active Fire Protection - Suppression

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
WS-2A-48-1	Preaction Sprinkler System, U2-4, Passageway to Unit 1, Room 2316	-	Yes	-- E: Required to support a fire area boundary evaluation.	Yes	-
WS-2A-48-2	Preaction Sprinkler System, U2-4, Hallway, Room 2322	-	Yes	-- E: Required to support a fire area boundary evaluation.	Yes	-

#### Fire Barriers

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
U0-FNP-N-316/2316-U1-4/U2-4-139	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U0-FNP-S-309/2309-U1-4/U2-4-139	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2188/2330-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2205/2316-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2206/2307-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2206/2310-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2207/2309-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2208/2312-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2208/2327-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2208/2330-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2208/2332-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2208/2351-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2209/2312-4/4-121	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2209/2322-4/4-139	3:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2218/2325-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2219/2332-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2221/2327-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2222/2332-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2230/2332-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2232/2330-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2237/2332-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2253/2310-4/4-139	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2307/2405-4/4-155	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-
U2-FNP-Ceiling-2309/2406-4/4-155	0:00, ,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	-

## Fire Safety Analysis

**Fire Area ID:** 2-004-U1 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	

## Fire Safety Analysis

**Fire Area ID:** 2-004-U1 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Performance-based approach Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-004-U1 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 8, TE-BE-03-9899-001 Technical Evaluation in Support of GL 86-10 for DCP 03-2-9899, Reroute Cables For RWST Suction Valve Q2E21LCV0115D-B
----------------------------------	---

<b>Inactive</b>	Yes
-----------------	-----

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

The purpose of the evaluation is to assess the adequacy of the separation for redundant trains of the RWST suction valves. The valves are not separated in accordance with the requirements of Appendix R, Section III.G.2 in that the area of spatial separation is not provided with whole area suppression.

Bases for Acceptability:

The acceptability of the evaluation is based on spatial separation, location of combustibles, limited in situ combustibles, whole area detection with partial suppression, and fire barriers. In addition, administrative controls have been established to maintain the non-suppressed area free of transient combustibles or to establish compensatory actions.

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
----------------------------------	--

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	2-004-U1 - Aux Building Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The fire severity in the affected rooms is less than 30 minutes for all cases.</li> <li>• A sprinkler system is installed in rooms 161, 179, 2161, and 2179</li> <li>• Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-37), Unit 2 Auxiliary Building, Elevations 100, 121, 130, 139, 155, and 184 ft. (Fire Area 2-004) ), Enclosure of one train with a 1 hour rated fire barrier with automatic fire suppression and detection (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression and lack of separation of redundant trains by 3 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>For power distribution system:</p> <ul style="list-style-type: none"> <li>• The redundant MCCs 2A and 2B are separated by a 2-ft-thick reinforced concrete floor at el 139 ft - 0 in.</li> <li>• Unsealed penetrations have been reviewed and will not affect separation.</li> <li>• Minimum horizontal separation between components is approximately 66 feet with complete automatic suppression coverage at el 121 ft - 0 in.</li> <li>• The redundant dc distribution panels 2C and 2F are separated by a 2-ft-thick reinforced concrete floor at el 139 ft.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-004-U1 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

Previously Approved Engineering Evaluations

- The minimum horizontal separation between these redundant panels is approximately 55 ft and has complete automatic suppression coverage at el 121 ft - 0 in.
- A smoke detection system is installed in all rooms containing the subject equipment.
- Manual hose stations, portable extinguishers, and portable smoke removal equipment are available for use on the subject elevations.
- Manual actions can be performed to establish control of the atmospheric relief valves by closing the manual air vent valve to bleed off air from the diaphragm of the valve actuator, and thus control steam generator pressure and reactor coolant system temperature with the use of the manually controlled atmospheric relief valves.

For Instrumentation - condensate water storage tank level indication

- Redundant cables are separated by two, 2-ft-thick reinforced concrete floors at el 139 ft - 0 in. and 155 ft - 0 in. Unsealed penetrations have been reviewed and will not affect the separation.
- The Train-B cabling at el 121 ft - 0 in. is provided with automatic fixed suppression over 95 percent of its route.
- A smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations, portable carbon dioxide extinguishers, and portable smoke removal equipment are available for use on the subject elevations.

For instrument air - PORVs:

- Redundant cables are separated by a 2-ft-thick reinforced concrete floor at el 121 ft - 0 in. and 139 ft - 0 in.
- Unsealed penetrations in the subject floors have been reviewed
- Train A cables have full suppression coverage on el 100 ft - 0 in.
- Train B cables have full suppression coverage on el 121 ft - 0 in.
- Smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations and portable carbon dioxide extinguishers are available for use on the subject elevations.

For Auxiliary Feedwater:

- The 2-h provided by battery power to the turbine driven auxiliary feedwater UPS is adequate for existing procedures for manual operation to be implemented.

For HVAC - battery room ventilation:

- The requirement for battery and battery charger room ventilation is a long term requirement.
- Either portable ventilation equipment will be installed in the effected room(s) or
- The damaged ventilation system will be repaired within 20 hours of post-fire hot shutdown initiation to insure that battery room hydrogen concentrations do not exceed acceptable limits.

For steam release (cooldown):

- Manual action can be performed to establish manual control of the atmospheric relief valves by closing the manual air vent valve to bleed off air from the diaphragm of the valve actuator.

For Service Water:

- A long term manual action (greater than 24 h) can be performed to shift the service water discharge from the river and recirc. to the service water pond.

For neutron flux monitoring:

- Configuration of redundant equipment cables and equipment with respect to barriers would limit the fire to one train of equipment.
- Unsealed penetrations in the subject floor slab have been reviewed and will not affect the separation afforded by the concrete floor.

## Fire Safety Analysis

**Fire Area ID:** 2-004-U1 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

Previously Approved Engineering Evaluations

For boration/makeup, depressurization, and RCP seal integrity:

- Modification to provide a fire-rated barrier for Train-A raceways ADD1C-, ADD18A, and ADD21A.
- Full suppression coverage is provided in rooms 2163, 2162, 2161, 2160, and 2175
- Cables are separated by 2-ft-thick reinforced concrete except in room 2155 where there is 24 ft of separation with no intervening combustibles.
- Unsealed penetrations in the subject walls have been reviewed.
- A smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations, portable CO, extinguishers, and portable smoke removal equipment are available for use on this elevation.
- Heat collectors have been installed on all sidewall sprinkler heads in room 2161.
- Modification is to provide a fire-rated barrier for the Train-B charging pump room cooler power cable (Raceways BFD02B, BFD03B, and BFD06B) where this cable is in close proximity to redundant Train-A cables.
- Automatic fire suppression system is provided.
- The blockout near Col. 20 which communicates between elevation 100 ft and 121 ft. will be sealed.
- EI 100 ft. and 121 ft - Automatic suppression and detection systems provided for the subject Train-B cables.
- Cables are separated by a 2-ft-thick reinforced concrete slab floor at el 121 ft - 0 in.
- Unsealed penetrations in the floor slab have been reviewed
- Raceways BFD2GD, BFD21B, BHF457, and BHF42 have been provided with a fire barrier in room 2186, to ensure that a source of borated makeup water is available from the RWST and will not require any manual operator action.
- The cabling for LCV115D has been protected by the fire barrier installed in the modification above and will not fail in the closed position.

For Smoke Detection:

- Smoke detection has been added to Room 2342 (spent fuel pool pump room).
- All cabling in this pipe chase (room 2341) is enclosed in conduit.
- The pipe chase has no in situ combustible.
- The pipe chase exits the auxiliary building below grade.
- This transition from room 2608 to room 2341 has a concrete wall with water tight penetrations.
- There is no redundant safe-shutdown cabling in room 2341.
- Low in situ combustible loading and the very low probability of a transient combustible being introduced.

For reactor coolant boundary integrity:

- Manual action can be performed to remove power from all cables in the shared raceway. This can be accomplished by opening the supply breaker on 125 V-dc switchgear 2A for 125 V-dc distribution panel 2C.

To summarize manual actions and licensee commitments:

- Manual operator actions can be performed to regain control of the transfer relays associated with the PORVs and the reactor head vent valves, restoration of the battery room ventilation system, manual control of the TDAFW pump, manual control of one main steam atmospheric relief valve, manual service water valve line up to the service water pond, and the isolation or RCS and pressurizer sampling line isolation valves.
- Licensee has also committed to install heat collectors on the sidewall mounted sprinkler/spray nozzles in room 2161, seal a floor slab blackout on elevation 121 feet - 0 inches and install a raceway fire barrier in the boric acid room 2186.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9925, DCP 03-2-9927, DCP 03-2-9930, and DCP 03-2-9899.

The portion of this exemption that support separation within the fire area are no longer required because the fire risk evaluation, SE-C051326701-008, has

Fire Zone ID	Description	Elevation(s)
2221-U2	2221 Primary Spent-Resin Storage Tank Room	
2222-U2	2222 Corridor	
2230-U2	2230 Recycle Evaporator Package Room	
2231-U2	2231 Sluice Pump Room	
2232-U2	2232 Sluice Filter Room	
2237-U2	2237 Corridor	
2238-U2	2238 Cask Storage Area	
2239-U2	2239 Transfer Canal	
2240-U2	2240 Spent-Fuel Pool Room	
2253-U2	2253 Valve Compartment	
2301-U2	2301 Seal Water Filter Room	
2302-U2	2302 Recycle Evaporator Feed Filter Room	
2303-U2	2303 Reactor Coolant Filter Room	
2304-U2	2304 Waste Monitor	
2305-U2	2305 Seal Injection Filter Room	
2306-U2	2306 Recycle Evaporator Feed Demineralizer Room	
2307-U2	2307 Valve Compartment Room	
2308-U2	2308 Waste Condensate and Monitor Tank Demineralizer Room	
2309-U2	2309 Hatch Area	
2310-U2	2310 Valve Compartment Room	
2311-U2	2311 Recycle Evaporator Concentrates Filter Room	
2312-U2	2312 Corridor	
2313-U2	2313 Floor Drain and Laundry Tank Filter Room	
2314-U2	2314 Waste Evaporator Feed Filter Room	
2315-U2	2315 Recycle Waste Condenser Filter Room	
2316-U2	2316 Passageway to Unit 1	
2321-U2	2321 Sample Panel Room	
2322-U2	2322 Hallway	
2323-U2	2323 Sample Room	
2324-U2	2324 Primary Chemistry Lab	
2325-U2	2325 Counting Room/Spectro-photometer Lab	
2326-U2	2326 Clean Storage Room	
2327-U2	2327 Valve Access Area	
2328-U2	2328 BTR Demineralizer Room	
2329-U2	2329 Pipe Tunnel	
2330-U2	2330 Chiller Surge Tanks Pump Room	
2331-U2	2331 Valve Access Area	
2332-U2	2332 MCC 1A/2A Area	
2340-U2	2340 Demineralizer Compartment	
2341-U2	2341 Pipe Chase	

## Fire Safety Analysis

**Fire Area ID:** 2-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Fire Area Definition**

Fire Zone ID	Description	Elevation(s)
2342-U2	2342 Spent-Fuel Pool Pump Room	
2348-U2	2348 Cask Wash Area	
2351-U2	2351 Chiller Pump and Surge Tank Room	
2402-U2	2402 Passage to Unit 1	
2403-U2	2403 Respirator Issue Room/Combustible Storage Room	
2405-U2	2405 Hatch Room	
2406-U2	2406 Tool Room	
2408-U2	2408 Hallway	
2409-U2	2409 Hallway	
2410A-U2	2410A 600-V Load Center	
2418-U2	2418 Auxiliary Building and Containment Purge Vent Equipment Room	
2419-U2	2419 Demineralizer Hatch Area	
2422-U2	2422 Corridor	
2423-U2	2423 Valve Compartment	
2424-U2	2424 Demineralizer Compartments	
2425-U2	2425 Demineralizer Compartments	
2426-U2	2426 Demineralizer Compartments	
2427-U2	2427 Demineralizer Compartments	
2429-U2	2429 Containment Purge Air Equipment Room	
2431-U2	2431 Duct/Pipe Chase	
2445-U2	2445 Spent-Fuel Pool Heat Exchanger Room	
2446-U2	2446 Hallway	
2448-U2	2448 SFPC Pump Room	
2449-U2	2449 Demineralizer Room	
2450-U2	2450 Valve Compartment	
2451-U2	2451 Filter Room	
2467-U2	2467 SFP Heat Exchanger Room	
2478-U2	2478 Motor Control Center Room	
2504-U2	2504 Stair No. 6, Floor El. 184'-0"	
2505-U2	2505 Spent-Fuel Pool Vent Equipment Room	
2604-U2	2604 Passage	
2605-U2	2605 Blowdown Pumps and Surge Tank Room	
2606-U2	2606 Filter Room	
2607-U2	2607 Filter Room	
2608-U2	2608 Blowdown Heat Exchanger Room	
2609-U2	2609 Storage Room	
2610-U2	2610 Valve Compartment Room	

## Fire Safety Analysis

**Fire Area ID:** 2-004-U2 - Aux Building  
**Fire Zone ID:** 2151-U2 - 2151 Waste Gas Decay Tank Rooms

## Fire Safety Analysis

**Fire Area ID:** 2-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by performance-based approach isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using performance-based approach orifice isolation, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train A charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 2. 4. RCS Temperature - RCS Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Performance-based approach Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-004-U2 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-004-U2 - Aux Building NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The fire severity in the affected rooms is less than 30 minutes for all cases.</li> <li>• A sprinkler system is installed in rooms 161, 179, 2161, and 2179</li> <li>• Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-37), Unit 2 Auxiliary Building, Elevations 100, 121, 130, 139, 155, and 184 ft. (Fire Area 2-004) ), Enclosure of one train with a 1 hour rated fire barrier with automatic fire suppression and detection (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression and lack of separation of redundant trains by 3 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>For power distribution system:</p> <ul style="list-style-type: none"> <li>• The redundant MCCs 2A and 2B are separated by a 2-ft-thick reinforced concrete floor at el 139 ft - 0 in.</li> <li>• Unsealed penetrations have been reviewed and will not affect separation.</li> <li>• Minimum horizontal separation between components is approximately 66 feet with complete automatic suppression coverage at el 121 ft - 0 in.</li> <li>• The redundant dc distribution panels 2C and 2F are separated by a 2-ft-thick reinforced concrete floor at el 139 ft.</li> <li>• The minimum horizontal separation between these redundant panels is approximately 55 ft and has complete automatic suppression coverage at el 121 ft - 0 in.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Previously Approved Engineering Evaluations

- A smoke detection system is installed in all rooms containing the subject equipment.
- Manual hose stations, portable extinguishers, and portable smoke removal equipment are available for use on the subject elevations.
- Manual actions can be performed to establish control of the atmospheric relief valves by closing the manual air vent valve to bleed off air from the diaphragm of the valve actuator, and thus control steam generator pressure and reactor coolant system temperature with the use of the manually controlled atmospheric relief valves.

For Instrumentation - condensate water storage tank level indication

- Redundant cables are separated by two, 2-ft-thick reinforced concrete floors at el 139 ft - 0 in. and 155 ft - 0 in. Unsealed penetrations have been reviewed and will not affect the separation.
- The Train-B cabling at el 121 ft - 0 in. is provided with automatic fixed suppression over 95 percent of its route.
- A smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations, portable carbon dioxide extinguishers, and portable smoke removal equipment are available for use on the subject elevations.

For instrument air - PORVs:

- Redundant cables are separated by a 2-ft-thick reinforced concrete floor at el 121 ft - 0 in. and 139 ft - 0 in.
- Unsealed penetrations in the subject floors have been reviewed
- Train A cables have full suppression coverage on el 100 ft - 0 in.
- Train B cables have full suppression coverage on el 121 ft - 0 in.
- Smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations and portable carbon dioxide extinguishers are available for use on the subject elevations.

For Auxiliary Feedwater:

- The 2-h provided by battery power to the turbine driven auxiliary feedwater UPS is adequate for existing procedures for manual operation to be implemented.

For HVAC - battery room ventilation:

- The requirement for battery and battery charger room ventilation is a long term requirement.
- Either portable ventilation equipment will be installed in the effected room(s) or
- The damaged ventilation system will be repaired within 20 hours of post-fire hot shutdown initiation to insure that battery room hydrogen concentrations do not exceed acceptable limits.

For steam release (cooldown):

- Manual action can be performed to establish manual control of the atmospheric relief valves by closing the manual air vent valve to bleed off air from the diaphragm of the valve actuator.

For Service Water:

- A long term manual action (greater than 24 h) can be performed to shift the service water discharge from the river and recirc. to the service water pond.

For neutron flux monitoring:

- Configuration of redundant equipment cables and equipment with respect to barriers would limit the fire to one train of equipment.
- Unsealed penetrations in the subject floor slab have been reviewed and will not affect the separation afforded by the concrete floor.

For boration/makeup, depressurization, and RCP seal integrity:

- Modification to provide a fire-rated barrier for Train-A raceways ADD1C-, ADD18A, and ADD21A.
- Full suppression coverage is provided in rooms 2163, 2162, 2161, 2160, and 2175

## Fire Safety Analysis

**Fire Area ID:** 2-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Previously Approved Engineering Evaluations**

- Cables are separated by 2-ft-thick reinforced concrete except in room 2155 where there is 24 ft of separation with no intervening combustibles.
- Unsealed penetrations in the subject walls have been reviewed.
- A smoke detection system is installed in all rooms containing the subject cabling.
- Manual hose stations, portable CO, extinguishers, and portable smoke removal equipment are available for use on this elevation.
- Heat collectors have been installed on all sidewall sprinkler heads in room 2161.
- Modification is to provide a fire-rated barrier for the Train-B charging pump room cooler power cable (Raceways BFD02B, BFD03B, and BFD06B) where this cable is in close proximity to redundant Train-A cables.
- Automatic fire suppression system is provided.
- The blockout near Col. 20 which communicates between elevation 100 ft and 121 ft. will be sealed.
- EI 100 ft. and 121 ft - Automatic suppression and detection systems provided for the subject Train-B cables.
- Cables are separated by a 2-ft-thick reinforced concrete slab floor at el 121 ft - 0 in.
- Unsealed penetrations in the floor slab have been reviewed
- Raceways BFD2GD, BFD21B, BHF457, and BHF42 have been provided with a fire barrier in room 2186, to ensure that a source of borated makeup water is available from the RWST and will not require any manual operator action.
- The cabling for LCV115D has been protected by the fire barrier installed in the modification above and will not fail in the closed position.

For Smoke Detection:

- Smoke detection has been added to Room 2342 (spent fuel pool pump room).
- All cabling in this pipe chase (room 2341) is enclosed in conduit.
- The pipe chase has no in situ combustible.
- The pipe chase exits the auxiliary building below grade.
- This transition from room 2608 to room 2341 has a concrete wall with water tight penetrations.
- There is no redundant safe-shutdown cabling in room 2341.
- Low in situ combustible loading and the very low probability of a transient combustible being introduced.

For reactor coolant boundary integrity:

- Manual action can be performed to remove power from all cables in the shared raceway. This can be accomplished by opening the supply breaker on 125 V-dc switchgear 2A for 125 V-dc distribution panel 2C.

To summarize manual actions and licensee commitments:

- Manual operator actions can be performed to regain control of the transfer relays associated with the PORVs and the reactor head vent valves, restoration of the battery room ventilation system, manual control of the TDAFW pump, manual control of one main steam atmospheric relief valve, manual service water valve line up to the service water pond, and the isolation or RCS and pressurizer sampling line isolation valves.
- Licensee has also committed to install heat collectors on the sidewall mounted sprinkler/spray nozzles in room 2161, seal a floor slab blackout on elevation 121 feet - 0 inches and install a raceway fire barrier in the boric acid room 2186.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9925, DCP 03-2-9927, DCP 03-2-9930, and DCP 03-2-9899.

The portion of this exemption that support separation within the fire area are no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

A non fire-rated steel hatch exists between rooms 2163 (fire area 2-004) and room 2103 (fire area 2-001). That portion of the exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-004-U2 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)
-------------------------	--

<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"><li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li><li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li><li>• The weld strength is equivalent to that of the structural supporting steel material.</li><li>• A seismic event is not postulated to occur concurrently with the fire.</li></ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-005 - Aux Building  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 2: Subcritical conditions are maintained by performance-based approach isolating the VCT to prevent boron dilution and by charging borated water from the RWST using performance-based approach Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.</li> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve.</li> <li>Unit 1: Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using performance-based approach Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	

## Fire Safety Analysis

**Fire Area ID:** 2-005 - Aux Building  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Nuclear Safety Performance Goals

Performance Goal	Method of Accomplishment	Comments
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	<ul style="list-style-type: none"><li>• Unit 2: Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.</li><li>• Unit 1: Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.</li></ul>	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	2-005 - Aux Building Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The fire severity in the affected rooms is less than 30 minutes for all cases.</li> <li>• A sprinkler system is installed in rooms 161, 179, 2161, and 2179</li> <li>• Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-005 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

### Licensing Action

Appendix R Exemption (No. 2-8), Unit 2 Auxiliary Building (Fire Area 2-005) 20 feet separation without intervening combustibles, with automatic fire suppression (III.G.2.b criteria)

### Licensing Basis

Exemption request per 03/13/1985, 10/18/1985, and 01/27/1986 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, and lack of separation of redundant trains by 3 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:

For physical separation of the Charging Pumps

- The pump rooms are watertight with 2-ft thick reinforced concrete walls.
- Penetrations in the pump room walls are sealed to provide a watertight boundary
- Lubricating oil and cable insulation are the only combustibles present in the pump rooms. Lubricating oil would be contained within the individual rooms or would drain into the sump servicing the room.
- Fixed suppression system is installed in the hallway.
- Smoke detection systems are installed throughout the area including the three charging pump rooms.
- The maximum fire severity in these rooms due to in-situ loading is estimated to be less than 1 hour.
- The penetrations that are sealed have been included into the penetration seal surveillance program.

For Boron/Makeup

- Manual actions can be performed to regain RCS makeup
- A fire barrier is provided for raceway sections AHF15A, AHD12B, AIE258, AIE12B and AIE15B to protect cables for the boric acid flow control and the RWST to the boric acid blender valves. (These subject barriers also protect the RWST charging pump suction, boric acid dilution injection to the VCT cables and the redundant RWST charging pump suction train-A cables )
- Partial suppression coverage is provided
- Redundant RWST charging pump suction valve and cables are separated by approximately 15 feet.
- Detection is provided in the area of the subject components.
- Low in-situ combustible loading
- Automatic suppression covers most of the raceway fire barriers.
- Additional fire barriers that have been installed to ensure that a fire induced RCS letdown will not occur.

For Reactor Coolant Boundary Integrity

- Manual actions can be performed to regain the control of the PORVs and reactor head vent valves.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9899 and DCP 03-2-9925.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.</li> </ul>	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-006 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 11, DOEJ-BE-03-9932-001 Documentation of Engineering Judgement in Support of GL 86-10 Evaluation for DCP 2039993201, Reroute B Train CCW Pump 4KV Power Cable Q2P17M001A-B
<b>Inactive</b>	Yes
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the adequacy of the separation for Train A and B of the CCW pumps/raceways valves and the Train A RHR Pump and Pump Room cooler raceways. The pumps/raceways are not separated in accordance with the requirements of Appendix R, Section III.G.2 in that the area of spatial separation is not provided with whole area suppression.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on spatial separation, location of combustibles, limited in situ combustibles, whole area detection with partial suppression, and fire barriers. In addition, administrative controls have been established to maintain the non-suppressed area free of transient combustibles or to establish compensatory actions.</p>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>

<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 2-006 - Aux Building  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	2-006 - Aux Building Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-31), Non-Rad. Side Corridor - Auxiliary Building EI 121 ft. (Fire Area 2-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Steel equipment hatch covers located in the floor and ceiling of fire area 2-020, room 2234 which form part of fire area boundary with fire areas 2-006, room 2185 and 2-042, room 2345 respectively are not fire-rated.</li> <li>• The steel hatch covers are protected by a suppression system.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-35), Unit 2 Auxiliary Building, Elevations 100, 121, 127, 139, 155 and 175 ft. (Fire Area 2-006), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 12/29/1986 for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating:</p> <p>A non fire-rated, watertight door # 2170 exists between fire area 2-006, room 2190 and fire area 2-S01, Stairwell # 1; and a non fire-rated, pressure tight door # 2330 exists between fire area 2-006, room 2241 and fire area 2-S01, Stairwell # 1.</p> <ul style="list-style-type: none"> <li>• These doors are normally maintained closed. Smoke detection system is provided in rooms on both sides of these doors.</li> <li>• The smoke detection system in rooms 2190 and 2241 alarms locally and are annunciated in the main control room and will provide early warning of a pending fire condition, prompting a fire brigade response. The smoke detection system in stairwell # 1 is provided with only local alarm.</li> <li>• Portable extinguishers and fire hose cabinets are available nearby for fire brigade's use in stairwell # 1.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-006 - Aux Building  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

Previously Approved Engineering Evaluations

- An automatic fire suppression system is provided in room 2190.
- The combustible loading in room 2241 (main steam valve room) is less than 30 minutes and access to this area during plant operation is restricted. Based on the configuration and fire protection provided, a fire on either side of these doors will not propagate to the adjacent fire area.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-35), Unit 2 Auxiliary Building, Elevations 100, 121, 127, 139, 155 and 175 ft. (Fire Area 2-006), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 12/29/1986, and again on 01/12/1993:

For AFW pump rooms:

- The AFW pump rooms are highly segregated watertight rooms with 2-ft thick reinforced concrete walls and watertight doors that are maintained closed.
- Lubricating oil and cable insulation are the only combustibles present in the pump rooms. Leaking oil would be contained within the individual rooms or would drain into the sump servicing the room.
- The combustible loading of any one pump room is estimated to be less than 30,000 Btu/sq-ft with a maximum fire severity of less than 30 min.
- A smoke detection system is installed in each of the three auxiliary feedwater pump rooms.
- A manual hose station, portable CO2 extinguishers, and portable smoke removal equipment are available.
- The sealed penetrations shall be placed in the surveillance program.

For CCW pump and heat exchanger rooms:

- A smoke detection system is installed throughout the area.
- An automatic sprinkler system is installed over the CCW pumps and in areas where cables are concentrated.
- Low quantity of combustible material with a maximum fire severity of less than 30 minutes.
- A manual hose station, portable CO2 extinguishers, and portable smoke removal equipment are available for use in the area.
- Heat detectors are provided in the 5-kV CCW pump disconnect switch; 5-kV disconnect switch cabinets are provided with a total-flooding Carbon Dioxide system.
- The CCW pump cables are wrapped with two 1-in. layers of Kaowool with the exception of the train-A cables for the swing CCW pump which are wrapped with a single 1-in. layer.
- Cables for the train-B service water inlet and discharge valves on the CCW heat exchangers are protected by two 1-in. layers of Kaowool and covered by automatic suppression.
- Redundant service water valves are separated by a distance of approximately 10 ft. with minimal intervening combustibles consisting primarily of cable insulation.
- The sprinkler system has been modified in order to provide direct unobstructed impingement on the CCW pumps.

For Main Steam Release:

- The combustible loading of the main steam and feedwater valve room (2241) and the plant heating equipment room (2189) is such that the maximum expected fire severity is less than 30 min for each room.

## Fire Safety Analysis

**Fire Area ID:** 2-006 - Aux Building  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

Previously Approved Engineering Evaluations

- Room 2241 is a restricted area with limited personnel access during plant operation.
- A smoke detection system is installed throughout both rooms.
- An automatic sprinkler system covers room 2189.
- A manual hose station, portable extinguishers and portable smoke removal equipment are available for use in both rooms.
- Adequate degree of separation is provided between the main steam lines, MSARVs and their associated control cabling in room 2241.
- Manual actions can be performed to regain control of the MSARVs.

For lack of fire detection and suppression in rooms 2242, 2243, 2236, and 2195:

- Rooms 2242, 2243, 2236, and 2195 do not contain any safe shutdown equipment or cabling.

Per the FSAR, exemption request 1-38 provided the following justification for lack of separation and lack of full area smoke detection:

For the AFW pump rooms (per the FSAR):

- Watertight room construction for the Train B pump
- Low quantity of combustible material with a maximum fire severity of less than one hour
- A smoke detection system in the AFW pump room
- The availability of equipment for use by the fire brigade

For the lack of full area smoke detection coverage (per the FSAR):

- Cables in room 2195 are routed in conduits. This room contains no in-situ combustible materials or redundant safe shutdown functions.
- Rooms 2236, 2242, and 2243 do not contain any safe-shutdown equipment, raceways or any in-situ combustible materials.

Elimination of the reliance on Kaowool raceway fire barriers for the CCW system in this area is resolved by DCP 03-2-9925, DCP 03-2-9932, DCP 03-2-9905, and GL 86-10

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

### Licensing Action

Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)

### Licensing Basis

Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:

All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:

- Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.
- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

## Fire Safety Analysis

---

**Fire Area ID:** 2-006 - Aux Building  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

---

**Previously Approved Engineering Evaluations**

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 2-008-U1 - Aux Building Cable Chase, Room 2116  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-008-U1 - Aux Building Cable Chase, Room 2116  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 2-008-U2 - Aux Building Cable Chase, Room 2116  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using performance-based approach Train B MDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Performance-based approach pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 2-008-U2 - Aux Building Cable Chase, Room 2116

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-008-U2 - Aux Building Cable Chase, Room 2116

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 2-009-U1 - Aux Building Cable Chase, Rooms 2117 & 2246  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room OR Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room OR Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-009-U1 - Aux Building Cable Chase, Rooms 2117 & 2246  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-009-U1 - Aux Building Cable Chase, Rooms 2117 & 2246	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-009-U1 - Aux Building Cable Chase, Rooms 2117 & 2246 NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-19), Unit 2 Train B Inside Cable Chases, Auxiliary Building (Fire Area 2-009), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985, 06/26/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The control cable associated with at least one of the auxiliary feedwater isolation valves has been protected by two 1-in. layers of Kaowool blanket with an overall layer of Zetex fabric or it will be rerouted out of the fire area.</li> <li>• Manual actions can be performed to regain control of a pressurizer PORV and isolate the Train B pressurizer PORV, reactor head vent and pressurizer block valves from a hot shot spurious signal.</li> <li>• Q2P16SV3009-B will be de-energized to ensure it remains in the open position whenever CCW Heat exchanger 2B is aligned and operating as the Train A heat exchanger.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-009-U1 - Aux Building Cable Chase, Rooms 2117 & 2246	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 2-009-U2 - Aux Building Cable Chase, Rooms 2117 & 2246  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and performance-based approach Train B PORV or block valve. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring performance-based approach auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 2-009-U2 - Aux Building Cable Chase, Rooms 2117 & 2246

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Although the sprinkler flow capacity may exceed drainage capacity, all water will drain to the bottom of the chase below elevation 100'. This will not impact the adjacent space or cables in the chase. Fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-009-U2 - Aux Building Cable Chase, Rooms 2117 & 2246

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-009-U2 - Aux Building Cable Chase, Rooms 2117 & 2246 NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-19), Unit 2 Train B Inside Cable Chases, Auxiliary Building (Fire Area 2-009), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985, 06/26/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The control cable associated with at least one of the auxiliary feedwater isolation valves has been protected by two 1-in. layers of Kaowool blanket with an overall layer of Zetex fabric or it will be rerouted out of the fire area.</li> <li>• Manual actions can be performed to regain control of a pressurizer PORV and isolate the Train B pressurizer PORV, reactor head vent and pressurizer block valves from a hot shot spurious signal.</li> <li>• Q2P16SV3009-B will be de-energized to ensure it remains in the open position whenever CCW Heat exchanger 2B is aligned and operating as the Train A heat exchanger.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-009-U2 - Aux Building Cable Chase, Rooms 2117 & 2246	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 2: Train A component cooling water is provided with non-essential loads isolated.</li><li>• Unit 1: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-012 - Hallway & Local Hot Shutdown Panel Room  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Summary**

Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

**Licensing Action** Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

**Licensing Basis** Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 2-012 - Hallway & Local Hot Shutdown Panel Room  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Required Systems and Features

Fire Zone ID	Description	Required Suppression System	Required Detection System	Required Fire Protection Feature	Required Fire Protection Feature and System Details

## Fire Safety Analysis

**Fire Area ID:** 2-013-U1 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-013-U1 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system location of equipment being above water collection area in chase. There are no drains in the electrical chase, but all water would collect below the cable trays. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-013-U1 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.3 Deterministic Approach	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>

### Engineering Evaluations

<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	ENGDOC, TE-BE-03-9902-002, Technical Evaluation in Support of FL 86-10 for DCP 03-1-9902 Install Fire Rated M.I. Cables in Fire Areas 1-013; 1-042, 2-013; and 2-042 for Control Circuits Associated With DG 1-2A and DG 1C
<b>Inactive</b>	Yes
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.</p> <p>Bases for Acceptability:</p> <p>The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on</p> <ul style="list-style-type: none"><li>• full area detection and suppression;</li><li>• limited fire hazards;</li><li>• an assessment of in situ combustibles; and</li><li>• the substantial construction of the fire area boundary.</li></ul> <p>To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-013-U1 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-013-U1 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500 NFPA 805, Section 4.2.3 Deterministic Approach	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 2-15), Unit 2 Auxiliary Building Vertical Cable Chase (Fire Area 2-013), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain the control of the pressurizer PORVs.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9906. However, note that the APC correspondence and the NRC SER regarding this exemption request do not take credit for the Kaowool fire barrier.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):</p> <ul style="list-style-type: none"> <li>• The MI cable support span is within the fire test configurations.</li> <li>• The materials for the MI cable supports are bounded by the fire test configurations.</li> <li>• The MI cable installation hardware is in accordance with the fire test configurations.</li> <li>• The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.</li> <li>• The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-013-U1 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 2-013-U2 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and performance-based approach Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2A/2B. Main feed is performance-based approach isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - Performance-based approach RCS pressure is monitored. 3. Pressurizer Level - Performance-based approach pressurizer level is monitored. 4. RCS Temperature - Performance-based approach RCS Loop 1/Loop 2 temperature is monitored. 5. SG Pressure - Performance-based approach Steam Generator 2A/2B pressure is monitored. 6. SG Level - Performance-based approach Steam Generator 2A/2B level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG1-2A.2.4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	

## Fire Safety Analysis

**Fire Area ID:** 2-013-U2 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train AHVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system location of equipment being above water collection area in chase. There are no drains in the electrical chase, but all water would collect below the cable trays. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-013-U2 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	ENGDOC, TE-BE-03-9902-002, Technical Evaluation in Support of FL 86-10 for DCP 03-1-9902 Install Fire Rated M.I. Cables in Fire Areas 1-013; 1-042, 2-013; and 2-042 for Control Circuits Associated With DG 1-2A and DG 1C
<b>Inactive</b>	Yes
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.</p> <p>Bases for Acceptability:</p> <p>The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on</p> <ul style="list-style-type: none"><li>• full area detection and suppression;</li><li>• limited fire hazards;</li><li>• an assessment of in situ combustibles; and</li><li>• the substantial construction of the fire area boundary.</li></ul> <p>To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-013-U2 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-013-U2 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500 NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 2-15), Unit 2 Auxiliary Building Vertical Cable Chase (Fire Area 2-013), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain the control of the pressurizer PORVs.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9906. However, note that the APC correspondence and the NRC SER regarding this exemption request do not take credit for the Kaowool fire barrier.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):</p> <ul style="list-style-type: none"> <li>• The MI cable support span is within the fire test configurations.</li> <li>• The materials for the MI cable supports are bounded by the fire test configurations.</li> <li>• The MI cable installation hardware is in accordance with the fire test configurations.</li> <li>• The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.</li> <li>• The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-013-U2 - Aux Building Cable Chase, Rooms 2227, 2300, 2466, & 2500

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Previously Approved Engineering Evaluations**

- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 2-014 - Computer Room  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 2: Positive control of RCS pressure is accomplished with performance-based approach Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> <li>Unit 1: Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

**Fire Area ID:** 2-014 - Computer Room  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 2: 1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - Performance-based approach RCS pressure is monitored. 3. Pressurizer Level - Performance-based approach pressurizer level is monitored. 4. RCS Temperature - Performance-based approach RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Performance-based approach Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Performance-based approach Steam Generator 2A/2B/2C level is monitored.</li> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-014 - Computer Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

**Licensing Action** Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)

**Licensing Basis** Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:

All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:

- Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.
- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 2: Train B component cooling water is provided with non-essential loads isolated.</li><li>• Unit 1: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

		Previously Approved Engineering Evaluations
<b>Fire Area ID:</b>	2-015 - Communication Room	
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-3), Unit 2 Auxiliary Building, Communication Room (Fire Area 2-015), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to to regain the control of one main steam atmospheric relief valve and transfer relays for the pressurizer power operated relief valves (PORV), PORV block valves and head vent valves.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

**Systems and Features**

### Other Passive Features

## Fire Safety Analysis

**Fire Area ID:** 2-016 - Aux Building Battery Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 2A/2B/2C. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Nuclear Safety Performance Goals

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries Service Water	<ul style="list-style-type: none"><li>• Unit 2: Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li><li>• Unit 1: Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li></ul>	
7.3 Vital Auxiliaries Component Cooling Water	<ul style="list-style-type: none"><li>• Unit 2: Train B component cooling water is provided with non-essential loads isolated.</li><li>• Unit 1: Train A/Train B component cooling water is provided with non-essential loads isolated.</li></ul>	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 2-018 - Aux Building DC Switchgear Room  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-018 - Aux Building DC Switchgear Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 2-32), Unit 2 Train A DC Switchgear Room, Auxiliary Building, EI 121 ft (Fire Area 2-018), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li><li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-019 - Aux Building DC Switchgear Room  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

		Previously Approved Engineering Evaluations
<b>Fire Area ID:</b>	2-019 - Aux Building DC Switchgear Room	
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-33), Unit 2 Train B DC Switchgear Room, Auxiliary Building, EI 121 ft (Fire Area 2-019), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.</li><li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-020 - Aux Building  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>• Unit 2: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using performance-based approach Train A charging pump or swing charging pump via Train A power.</li> <li>• Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>• Unit 2: RCS inventory is controlled using performance-based approach Train A charging pump or swing charging pump via Train A power aligned to the RWST.</li> <li>• Unit 1: RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>• Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>• Unit 1 Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-020 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 9, TE-BE-03-9903-001 Technical Evaluation in Support of GL 86-10 for DCP 03-2-9903, Upgrade Unit 2 Mezzanine Floor in Fire Area 2-020
----------------------------------	---

<b>Inactive</b>	Yes
-----------------	-----

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

The purpose of the evaluation is to assess the adequacy of the separation for redundant trains of SSD equipment. The raceways are not separated in accordance with the requirements of Appendix R, Section III.G.2 in that the area of spatial separation is not provided with whole area suppression.

Bases for Acceptability:

The acceptability of the evaluation is based on spatial separation, location of combustibles, limited in situ combustibles, whole area detection with partial suppression, and fire barriers. In addition, administrative controls have been established to maintain the non-suppressed area free of transient combustibles or to establish compensatory actions.

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
----------------------------------	--

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 2-020 - Aux Building Compliance Basis: Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-10), Unit 2 Auxiliary Building Switchgear Room Train B (Fire Area 2-021), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Based on the construction, the installation of the door/transom assembly between rooms 2233 (area 2-021) and 2228 (area 2-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-14), Unit 2 Auxiliary Building CRDM Switchgear Room (Fire Area 2-023), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Based on the construction, the installation of the door/transom assembly between rooms 2235 (area 2-023) and 2234 (area 2-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-020 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

**Licensing Action** Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)

**Licensing Basis** Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:

All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:

- Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.
- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 2-021-U1 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-021-U1 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-021-U1 - Aux Building Switchgear Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B	Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-021-U1 - Aux Building Switchgear Rooms NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-10), Unit 2 Auxiliary Building Switchgear Room Train B (Fire Area 2-021, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain normal control of the service water system.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-10), Unit 2 Auxiliary Building Switchgear Room Train B (Fire Area 2-021), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression(III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-021-U1 - Aux Building Switchgear Rooms	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 2-10), Unit 2 Auxiliary Building Switchgear Room Train B (Fire Area 2-021), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Based on the construction, the installation of the door/transom assembly between rooms 2233 (area 2-021) and 2228 (area 2-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 2-31), Non-Rad. Side Corridor - Auxiliary Building EI 121 ft. (Fire Area 2-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"><li>• The door/transom assemblies separating rooms 2233 (Fire Area 2-021) and 2228 (Fire Area 2-020), and rooms 2235 (Fire Area 2-023) and 2234 (Fire Area 2-020), have been certified by the vendor as being constructed of materials and in a manner similar to that of the UL Class A criteria.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-021-U2 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach aux spray for pressure reduction and performance-based approach Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by of diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	

## Fire Safety Analysis

**Fire Area ID:** 2-021-U2 - Aux Building Switchgear Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond Or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Fire Area ID:</b>	2-021-U2 - Aux Building Switchgear Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B	Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-021-U2 - Aux Building Switchgear Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: 2-021-U2 - Aux Building Switchgear Rooms Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-10), Unit 2 Auxiliary Building Switchgear Room Train B (Fire Area 2-021, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain normal control of the service water system.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-10), Unit 2 Auxiliary Building Switchgear Room Train B (Fire Area 2-021), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression(III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

Fire Area ID: 2-021-U2 - Aux Building Switchgear Rooms Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 2-10), Unit 2 Auxiliary Building Switchgear Room Train B (Fire Area 2-021), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Based on the construction, the installation of the door/transom assembly between rooms 2233 (area 2-021) and 2228 (area 2-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-31), Non-Rad. Side Corridor - Auxiliary Building EI 121 ft. (Fire Area 2-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"><li>• The door/transom assemblies separating rooms 2233 (Fire Area 2-021) and 2228 (Fire Area 2-020), and rooms 2235 (Fire Area 2-023) and 2234 (Fire Area 2-020), have been certified by the vendor as being constructed of materials and in a manner similar to that of the UL Class A criteria.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-023-U1 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room OR Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room OR Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-023-U1 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b> 2-023-U1 - Aux Building Switchgear Room <b>Compliance Basis:</b> NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		<b>Engineering Evaluations</b>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment C Code Compliance Evaluation for NFPA 12A, 2004 Edition, Halon 1301 Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12A, 2004 Edition and NFPA 12A, 1973 Edition. The approach was to determine the applicable code editions for the Halon 1301 systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the applicable code editions</li> <li>• The Halon systems were determined to be compliant with the relevant sections of NFPA-12A-2004 and NFPA 12A-1973, with the exception of the non-compliances identified in the evaluations</li> <li>• Some non-compliances in against the 2004 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-023-U1 - Aux Building Switchgear Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	2-023-U1 - Aux Building Switchgear Room NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-11), Unit 2 Auxiliary Building CRDM Switchgear Room (Fire Area 2-023, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain normal control of the service water system.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-14), Unit 2 Auxiliary Building CRDM Switchgear Room (Fire Area 2-023), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

Fire Area ID: 2-023-U1 - Aux Building Switchgear Room Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 2-14), Unit 2 Auxiliary Building CRDM Switchgear Room (Fire Area 2-023), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Based on the construction, the installation of the door/transom assembly between rooms 2235 (area 2-023) and 2234 (area 2-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-31), Non-Rad. Side Corridor - Auxiliary Building EI 121 ft. (Fire Area 2-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"><li>• The door/transom assemblies separating rooms 2233 (Fire Area 2-021) and 2228 (Fire Area 2-020), and rooms 2235 (Fire Area 2-023) and 2234 (Fire Area 2-020), have been certified by the vendor as being constructed of materials and in a manner similar to that of the UL Class A criteria.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-023-U2 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV or aux spray} for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-023-U2 - Aux Building Switchgear Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b> 2-023-U2 - Aux Building Switchgear Room <b>Compliance Basis:</b> NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		<b>Engineering Evaluations</b>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment C Code Compliance Evaluation for NFPA 12A, 2004 Edition, Halon 1301 Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12A, 2004 Edition and NFPA 12A, 1973 Edition. The approach was to determine the applicable code editions for the Halon 1301 systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the applicable code editions</li> <li>• The Halon systems were determined to be compliant with the relevant sections of NFPA-12A-2004 and NFPA 12A-1973, with the exception of the non-compliances identified in the evaluations</li> <li>• Some non-compliances in against the 2004 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>

<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-023-U2 - Aux Building Switchgear Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: 2-023-U2 - Aux Building Switchgear Room Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-11), Unit 2 Auxiliary Building CRDM Switchgear Room (Fire Area 2-023, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain normal control of the service water system.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-14), Unit 2 Auxiliary Building CRDM Switchgear Room (Fire Area 2-023), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain the control of the pressurizer power operated relief valves (PORVs) and the transfer relays for the PORVs and the head vent valves.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

Fire Area ID: 2-023-U2 - Aux Building Switchgear Room Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 2-14), Unit 2 Auxiliary Building CRDM Switchgear Room (Fire Area 2-023), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Based on the construction, the installation of the door/transom assembly between rooms 2235 (area 2-023) and 2234 (area 2-020), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-31), Non-Rad. Side Corridor - Auxiliary Building EI 121 ft. (Fire Area 2-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985: .</p> <ul style="list-style-type: none"><li>• The door/transom assemblies separating rooms 2233 (Fire Area 2-021) and 2228 (Fire Area 2-020), and rooms 2235 (Fire Area 2-023) and 2234 (Fire Area 2-020), have been certified by the vendor as being constructed of materials and in a manner similar to that of the UL Class A criteria.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-030-U1 - Aux Building Cable Chase, Rooms 2249 & 2252  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-030-U1 - Aux Building Cable Chase, Rooms 2249 & 2252  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** 2-030-U1 - Aux Building Cable Chase, Rooms 2249 & 2252

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 2-030-U1 - Aux Building Cable Chase, Rooms 2249 & 2252 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-12), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train B (Fire Area 2-076, Unit 1 cables), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The fire-resistant coatings on the watertight door between auxiliary building (area 2-030) and cable tunnel (area 2-076) have been placed under the licensee's fire protection surveillance program.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-9), Unit 2 Auxiliary Building Cable Chase Train B (Fire Area 2-030, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain normal control of the service water system.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-030-U2 - Aux Building Cable Chase, Rooms 2249 & 2252  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2A. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	

## Fire Safety Analysis

**Fire Area ID:** 2-030-U2 - Aux Building Cable Chase, Rooms 2249 & 2252

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-030-U2 - Aux Building Cable Chase, Rooms 2249 & 2252	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment G Code Compliance Evaluation for NFPA 15, 2007 Edition, Water Spray Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 15, 2007 Edition and NFPA 15, 1973 Edition. The approach was to determine the applicable code editions for the water spray systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li><li>• The water spray systems were determined to be compliant with the relevant sections of NFPA 15-2007 and NFPA 15-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1973 Edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have been provided with justifications</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-030-U2 - Aux Building Cable Chase, Rooms 2249 & 2252	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: 2-030-U2 - Aux Building Cable Chase, Rooms 2249 & 2252 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-12), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train B (Fire Area 2-076, Unit 1 cables), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The fire-resistant coatings on the watertight door between auxiliary building (area 2-030) and cable tunnel (area 2-076) have been placed under the licensee's fire protection surveillance program.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-9), Unit 2 Auxiliary Building Cable Chase Train B (Fire Area 2-030, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain normal control of the service water system.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-031-U1 - Aux Building Cable Chase, Rooms 2250 & 2251  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room OR Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room OR Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-031-U1 - Aux Building Cable Chase, Rooms 2250 & 2251  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-031-U1 - Aux Building Cable Chase, Rooms 2250 & 2251

**Engineering Evaluations**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 2-031-U1 - Aux Building Cable Chase, Rooms 2250 & 2251 Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-7), Unit 2 Auxiliary Building Cable Chase Train A (Fire Area 2-031 Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-21), Unit 2 Auxiliary Building Cable Chase Train A (Fire Area 2-031), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain control of one main stream atmospheric relief valve and those actions necessary to monitor boron concentration utilizing the RCS sampling system.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-24), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 2-075), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Fire resistant coating on a door has been placed in a surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-031-U2 - Aux Building Cable Chase, Rooms 2250 & 2251  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.

## Fire Safety Analysis

**Fire Area ID:** 2-034 - Train B Electrical Pen Room & Filtration System  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	<ul style="list-style-type: none"> <li>Unit 2: Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li> <li>Unit 1: Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.</li> </ul>	
7.3 Vital Auxiliaries Component Cooling Water	<ul style="list-style-type: none"> <li>Unit 2: Train A component cooling water is provided with non-essential loads isolated.</li> <li>Unit 1: Train A/Train B component cooling water is provided with non-essential loads isolated.</li> </ul>	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-034 - Train B Electrical Pen Room & Filtration System	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment F Code Compliance Evaluation for NFPA 14, 2007 Edition, Standard for Installation of Standpipes and Hose Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 14, 2007 Edition. The approach was to determine the applicable code edition for the applicable systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Standpipe and hose systems were determined to be compliant with the relevant sections of NFPA 14, 2007 Edition, with the exception of the non-compliances identified in the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1976.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-034 - Train B Electrical Pen Room & Filtration System	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-034 - Train B Electrical Pen Room & Filtration System	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 2-18), Unit 2 Aux. Building, Electrical Pen. Rm Tr. B, and Pen. Room Filtration System Equip. Rm (Fire Area 2-034), Enclosure of one train by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain charging pump miniflow, establish reactor coolant pump seal injection, isolation of RCS and pressurizer sample lines, control of a main steam atmospheric relief valve, regain control of pressurizer PORV and reactor head vent valves and initiating RCS charging through the boron injection tank.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> <li>• A modification has been completed to install disconnect switches outside the electrical penetration room.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	2-035 - Train A Electrical Pen Rooms Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-9), Unit 2 Auxiliary Building Electrical Penetrations Room Train A (Fire Area 2-035), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression(III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain charging pump miniflow, establish manual operation of the auxiliary feedwater system, regain control of the pressurizer PORVs, and initiate RCS charging through the boron injection tank.</li> <li>• A design change installed as a result of R.G. 1.97 provides cable separation and redundant signal processing and indication for RCS hot leg temperature loop N2B21TE433.</li> <li>• The licensee installed disconnect switches outside the electrical penetration room for valve Q2E21MOV8131A-A (suction header) and valve Q2E21MOV8133A-A (discharge header). These valves are required to be maintained in the open position to supply seal injection water from the RWST through charging pump 2B.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>
