## DOCUMENT INSERTION SHEET

J. M. Farley Nuclear Plant – Unit No. 1 / 2

### NFPA 805 FIRE PROTECTION PROGRAM DESIGN BASIS DOCUMENT

Description	Remove	Insert
1. This insertion sheet	Existing Sheet(s)	Front of Manual
2. 2.0 Licensing Basis, 2.1 Compliance Requirements, page 8 (pdf pg. 10)	Existing Sheet	Ver. 6.0
3. 2.0 Licensing Basis, 2.2 NRC Acceptance, page 9 (pdf pg. 11)	Existing Sheet	Ver. 6.0
This change is required to add a new reference to the approval by the NRC for the Supplemental License Amendment Request (LAR) for NFPA 805. LDCR 2018-041 was approved on November 12, 2018 to request approval for the thermal insulation material already in use in the plant. The NRC approved the NFPA 805 supplemental LAR (ML19156A262) on July 30, 2019 and the Farley Operating Licenses for Unit 1 and Unit 2 were amended to 224 and 221 respectively.		
4. Fire Safety Analysis Data Manager (FSA 4.3), Fire Area ID: 073-SWIS Battery Room - Train B, Page 349 of 3544 (pdf pg. 475)	Existing Sheet	Ver. 6.0
5. Fire Safety Analysis Data Manager (FSA 4.3), Fire Area ID: 074-SWIS Battery Room - Train A, Page 358 of 3544 (pdf pg. 484)	Existing Sheet	Ver. 6.0
6. Fire Safety Analysis Data Manager (FSA 4.3), Fire Area ID: 075-U1-SWIS 5kV Switchgear Room B & West Stairs, Page 368 of 3544 (pdf pg. 494)	Existing Sheet	Ver. 6.0
7. Fire Safety Analysis Data Manager (FSA 4.3), Fire Area ID: 075-U2-SWIS 5kV Switchgear Room B & West Stairs, Page 381 of 3544 (pdf pg. 507)	Existing Sheet	Ver. 6.0
8. Fire Safety Analysis Data Manager (FSA 4.3), Fire Area ID: 076-U1-SWIS 5kV Switchgear Room A & East Stairs, Page 394 of 3544 (pdf pg. 520)	Existing Sheet	Ver. 6.0

9. Fire Safety Analysis Data Manager (FSA 4.3), Fire Area ID: 076-U2-SWIS 5kV Switchgear Room A & East Stairs, Page 406 of 3544 (pdf pg. 532)	Existing Sheet	Ver. 6.0
Fire safety analysis for fire dampers 1-188-332-01 and 1-188-332-02 change the HSS column value from "YES" to a dash "-". These dampers are not HSS per calculation SM-C051326701-017.

## APPENDIX TABLE OF CONTENTS

Appendix A.	OVERVIEW OF THE REGULATORY REQUIREMENTS – 10 CFR 50.48
Appendix B.	POWER BLOCK AND FIRE AREA DEFINITION
Appendix C.	NSCA METHODOLOGY REVIEW
Appendix D.	FUNDAMENTAL FIRE PROTECTION PROGRAM AND MINIMUM DESIGN ELEMENTS
Appendix E.	RECOVERY / DID ACTIONS BY FIRE AREA
Appendix F.	FIRE SAFETY ANALYSIS
Appendix G.	RADIOACTIVE RELEASE RESULTS

## 1.0 PURPOSE

The purpose of this Design Basis Document is to demonstrate how Joseph M. Farley Nuclear Plant (FNP) satisfies the requirements of 10 CFR 50.48(a) and 10 CFR 50.48(c).

### 1.1 Compliance Requirements

In accordance with NFPA 805 Section 2.7.1.2:

*"A fire protection program design basis document shall be established based on those documents, analyses, engineering evaluations, calculations, and so forth that define the fire protection design basis for the plant. As a minimum, this document shall include fire hazards identification and nuclear safety capability assessment, on a fire area basis, for all fire areas that could affect the nuclear safety or radioactive release performance criteria defined in Chapter 1."*

Compliance requirements for specific sections are outlined in each section.

### 1.2 NRC Acceptance

The NRC does not provide formal acceptance of the Design Basis Document. However, the NRC did acknowledge Farley's commitment to create a design basis document that meets the requirement of NFPA 805 Section 2.7.1.2 as summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c) dated March 10, 2015 (Section 2.6.1):

*"In LAR Attachment S, Table S-3, Implementation Item 28, the licensee included the action to create "a fire protection design basis document as described in Section 2.7.1.2 of NFPA 805 and necessary supporting documentation as described in Section 2.7.1.3 of NFPA 805 as part of transition to 10 CFR 50.48(c) to ensure program implementation following receipt of the safety evaluation." The NRC staff considers this action acceptable because the action will incorporate the provisions of NFPA 805 in the FPP and because it would be required by the proposed license condition."*

### 1.3 Ongoing Compliance Maintenance

This document satisfies the methodology and documentation requirements of NFPA 805 Chapter 2 by providing a roadmap to the analyses performed and the programmatic controls for ongoing compliance maintenance. The document is organized as follows:

- Fundamental Program Elements
- Nuclear Safety Performance Criteria
- Fire Probabilistic Risk Assessment
- Fire Modeling
- Radioactive Release
- Fire Response
- Program Documentation, Configuration Control, and Quality
- Monitoring
- Fire Safety Analysis

The revision history for this drawing is as follows. Version 1.0 was the original issue of this document.

Versions 2.0 and 3.0 incorporated modifications and changes in due dates for the license condition required modifications.

Version 4.0 corrected an NFPA 13 code of record discrepancy in Section 4.2.2.

Version 5.0 is a complete rewrite of the Design Basis Document to incorporate the changes made to the facility (over 600 modifications since 2010) and changes made in the Fire PRA model to address new or revised industry guidance and address errors identified in the previous models as part of the true up required prior to self-approval under NFPA 805. Several of the historical calculations that supported the initial NFPA 805 License Amendment Request were appendices to this document and have been deleted to ensure that the approved QA source documents (calculations) are used for reference instead. This rewrite includes format changes to describe the regulatory requirements, initial compliance as described in the NRC Safety Evaluation for NFPA 805 and the ongoing compliance maintenance being utilized by Farley. Changes to several of the Appendices were made and are described below.

Appendix C previously contained a printout from the ArcPlus™ Fire Safety Analysis (FSA) database that documented how the FNP NSCA methodology met the NRC endorsed guidance of NEI 00-01. However, since FSA is a living, controlled QA database, a duplication of this information in this DBD was determined to be not necessary. Therefore, the FSA printout has been deleted from Appendix C. For a copy of the original NSCA methodology evaluation, see calculation SE-513026701-006. For a copy of the current evaluation, contact site Fire Protection.

Appendix D previously contained a printout from the ArcPlus™ Fire Safety Analysis (FSA) database that documented how the FNP Fire Protection Program met the requirements of NFPA 805 Chapter 3. However, since FSA is a living, controlled QA database, a duplication of this comparison in this DBD was determined to be not necessary. Therefore, the FSA printout has been deleted from Appendix D. For a copy of the original comparison, see calculation SM-513026701-003. For a copy of the current comparison, contact site Fire Protection.

Appendix F provides the fire safety analysis for each fire area in Farley Units 1 and 2. The information includes safe shutdown strategy, credited fire protection systems and features, applicable fire protection engineering evaluations, and applicable licensing exemptions. This is a printout from the ArcPlus™ Fire Safety Analysis (FSA) database, which is a living, controlled QA database. This Appendix is provided here for information purposes and is the current information as of the date of the printout in the Appendix. To obtain the latest revision of this printout, reflecting the most current Farley Fire Protection Design and Licensing Basis, contact site Fire Protection.

Appendix G previously contained a printout from the SM-C0513026701-010 Radioactive Release Calculation. This Appendix was for information purposes only as a component of the NFPA 805 License Amendment Request. As SM-C0513026701-010 is revised, the methodology may change and will be reflected in a revision to the calculation. See the latest revision of this calculation for the most current Farley Fire Protection Design and Licensing Basis position on Radioactive Release.

Appendix H was a listing of Fire Protection related drawings that could be used as references when performing fire protection program change evaluations per procedure NMP-ES-035-006. These references are part of that procedure and did not need to be duplicated in this document. Therefore, Appendix H has been deleted during this revision.

No change bars are provided for version 5.0 as the changes are extensive.

## 2.0 LICENSING BASIS

### 2.1 Compliance Requirements

On July 16, 2004 the NRC amended 10 CFR 50.48, Fire Protection, to add a new subsection, 10 CFR 50.48(c), which established alternate fire protection requirements. 10 CFR 50.48(c) endorses, with exceptions, NFPA 805, Performance-Based Standard for Fire Protection for Light Water Reactor Electric Generating Plants – 2001 Edition (NFPA 805), as a voluntary alternative for demonstrating compliance with 10 CFR 50.48(b), Appendix R and Section (f), Decommissioning.

Southern Nuclear Operating Company submitted a letter of intent to the NRC on February 14, 2008 (ML080450434) for FNP to adopt NFPA 805 in accordance with 10 CFR 50.48(c). A License Amendment Request (LAR) was submitted on September 25, 2012 (ML12279A235). Other transition correspondence with the NRC is listed below:

- December 12, 2012 - U.S. Nuclear Regulatory Commission, letter to Southern Nuclear Operating Company, requesting supplemental information regarding the acceptance of the license amendment (ML12345A398)
- December 20, 2012 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Supplemental Information Regarding License Amendment Request For Transition to 10 CFR 50.48(c) – NFPA 805 Performance-Based Standard for Fire Protection for Light Water Reactor Generating Plants (2001 Edition) (ML12359A050)
- July 8, 2013 – U.S. Nuclear Regulatory Commission, letter to Southern Nuclear Operating Company, Request for Additional Information Concerning Voluntary Fire Protection Risk Initiative Request (ML13176A093)
- September 16, 2013 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML14038A019)
- October 30, 2013 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML13305A105)
- November 12, 2013 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML13318A027)
- March 28, 2014 – U.S. Nuclear Regulatory Commission, letter to Southern Nuclear Operating Company, Request for Additional Information Concerning Voluntary Fire Protection Risk Initiative Request (ML14073A053)
- April 23, 2014 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML14114A550)

- May 23, 2014 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML14147A368)
- July 3, 2014 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML14189A144)
- July 11, 2014 - U.S. Nuclear Regulatory Commission, letter to Southern Nuclear Operating Company, Request for Additional Information Regarding License Amendment Request to Adopt National Fire Protection Association Standard 805 (ML14176A070).
- August 11, 2014 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML14223A646)
- August 29, 2014 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML14246A523)
- October 13, 2014 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML14288A671)
- January 16, 2015 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Response to Request for Additional Information Regarding License Amendment Request for Transition to 10 CFR 50.48(c) – NFPA 805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML15016A199)
- April 25, 2016 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Supplemental License Amendment Request to revise Existing Facility Operating License Commitments Regarding NFPA-805 Performance Based Standard for Fire Protection for Light Water Reactor Generating Plants (ML16120A294)
- August 11, 2017 – Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Joseph M. Farley Nuclear Plants Units 1 and 2 NFPA-805 Transition Due Date Extension (ML17226A291)
- December 14, 2018 - Southern Nuclear Operating Company, letter to U.S. Nuclear Regulatory Commission, Joseph M. Farley Nuclear Plants Units 1 and 2 Fire Protection Alternative for Thermal Insulation Material (ML18348A733)

## 2.2 NRC Acceptance

The NRC initially issued Amendment No. 196 to Renewed Facility Operating License No. NPF-2 and Amendment No. 192 to Renewed Facility Operating License No. NPF-8 for FNP Units 1 and 2, respectively, on March 10, 2015 (ML14308A048) to approve the transition to NFPA 805. However, based on subsequent SNC requests, the NRC issued updated license amendments on October 17, 2016 [Amendments 205 and 201] (ML16232A000) and November 1, 2017 [Amendments 215 and 212] (ML17269A291) to extend the committed due date for achieving full compliance to NFPA 805, and July 30, 2019 [Amendments 224 and 221] (ML19156A262) to approve an alternative for thermal insulation material.

The FNP Unit 1 fire protection license condition 2.C(4) and FNP Unit 2 fire protection license condition 2.C(6) were replaced with the following:

*Southern Nuclear Operating Company shall implement and maintain in effect all provisions of the approved fire protection program that comply with 10 CFR 50.48(a) and 10 CFR 50.48(c), as specified in the licensee amendment request dated September 25, 2012; April 25, 2016; and supplements dated December 20, 2012; September 16, 2013; October 30, 2013; November 12, 2013; April 23, 2014; May 23, 2014; July 3, 2014; August 11, 2014; August 29, 2014; October 13, 2014; January 16, 2015, and August 11, 2017, as approved in the safety evaluation reports dated March 10, 2015, October 17, 2016, and November 1, 2017. Except where NRC approval for changes or deviations is required by 10 CFR 50.48(c), and provided no other regulation, technical specification, license condition or requirement would require prior NRC approval, the licensee may make changes to the fire protection program without prior approval of the Commission if those changes satisfy the provisions set forth in 10 CFR 50.48(a) and 10 CFR 50.48(c), the change does not require a change to a technical specification or a license condition, and the criteria listed below are satisfied.*

*a. Risk-Informed Changes that May Be Made Without Prior NRC Approval*

*A risk assessment of the change must demonstrate that the acceptance criteria below are met. The risk assessment approach, methods, and data shall be acceptable to the NRC and shall be appropriate for the nature and scope of the change being evaluated; be based on the as-built, as-operated, and maintained plant; and reflect the operating experience at the plant. Acceptable methods to assess the risk of the change may include methods that have been used in the peer-reviewed fire PRA model, methods that have been approved by NRC through a plant-specific license amendment or NRC approval of generic methods specifically for use in NFPA 805 risk assessments, or methods that have been demonstrated to bound the risk impact.*

- 1) Prior NRC review and approval is not required for changes that clearly result in a decrease in risk. The proposed change must also be consistent with the defense-in-depth philosophy and must maintain sufficient safety margins. The change may be implemented following completion of the plant change evaluation.*
- 2) Prior NRC review and approval is not required for individual changes that result in a risk increase less than  $1 \times 10^{-7}$ /year (yr) for CDF and less than  $1 \times 10^{-8}$ /yr for LERF. The proposed change must also be consistent with the defense-in-depth philosophy and must maintain sufficient safety margins. The change may be implemented following completion of the plant change evaluation.*

b. Other Changes that May Be Made Without Prior NRC Approval

1) *Changes to NFPA 805, Chapter 3, Fundamental Fire Protection Program*

*Prior NRC review and approval are not required for changes to the NFPA 805, Chapter 3, fundamental fire protection program elements and design requirements for which an engineering evaluation demonstrates that the alternative to the Chapter 3 element is functionally equivalent or adequate for the hazard. The licensee may use an engineering evaluation to demonstrate that a change to an NFPA 805, Chapter 3, element is functionally equivalent to the corresponding technical requirement. A qualified fire protection engineer shall perform the engineering evaluation and conclude that the change has not affected the functionality of the component, system, procedure, or physical arrangement, using a relevant technical requirement or standard.*

*The licensee may use an engineering evaluation to demonstrate that changes to certain NFPA 805, Chapter 3, elements are acceptable because the alternative is “adequate for the hazard.” Prior NRC review and approval would not be required for alternatives to four specific sections of NFPA 805, Chapter 3, for which an engineering evaluation demonstrates that the alternative to the Chapter 3 element is adequate for the hazard. A qualified fire protection engineer shall perform the engineering evaluation and conclude that the change has not affected the functionality of the component, system, procedure, or physical arrangement, using a relevant technical requirement or standard. The four specific sections of NFPA 805, Chapter 3, are as follows:*

- *“Fire Alarm and Detection Systems” (Section 3.8);*
- *“Automatic and Manual Water-Based Fire Suppression Systems” (Section 3.9);*
- *“Gaseous Fire Suppression Systems” (Section 3.10); and,*
- *“Passive Fire Protection Features” (Section 3.11).*

*This License Condition does not apply to any demonstration of equivalency under Section 1.7 of NFPA 805.*

2) *Fire Protection Program Changes that Have No More than Minimal Risk Impact*

*Prior NRC review and approval are not required for changes to the licensee’s fire protection program that have been demonstrated to have no more than a minimal risk impact. The licensee may use its screening process as approved in the NRC safety evaluation reports dated March 10, 2015 and October 17, 2016 to determine that certain fire protection program changes meet the minimal criterion. The licensee shall ensure that fire protection defense-in-depth and safety margins are maintained when changes are made to the fire protection program.*

c. Transition License Conditions

- 1) *Before achieving full compliance with 10 CFR 50.48(c), as specified by 2) below, risk-informed changes to the licensee's fire protection program may not be made without prior NRC review and approval unless the change has been demonstrated to have no more than a minimal risk impact, as described in 2) above.*
- 2) *The licensee shall implement the modifications to its facility as described in Attachment S, Table S-2, "Plant Modifications Committed," of SNC letter NL-15-2310 dated April 25, 2016, to complete the transition to full compliance with 10 CFR 50.48(c) before the conclusion of the 1R28 Spring 2018 Refueling Outage as provided in SNC letter dated August 11, 2017. The licensee shall maintain appropriate compensatory measures in place until completion of these modifications.*
- 3) *The licensee shall implement the items as listed in Attachment S, Table S-3, "Implementation Items," of SNC letter NL-14-1273, dated August 29, 2014, within 180 days after NRC approval, except for items 30 and 32. Items 30 and 32 shall be implemented by February 2, 2018.*

### **2.3 Ongoing Compliance Maintenance**

Based on the previous section being up to date, this section is no longer applicable. Any future changes to the fire protection licensing basis will be processed in accordance with 10 CFR 50.90, License Amendment Request.

### 3.0 DEFINITIONS

This section establishes the definitions of terms used in this document that apply to the Fire Protection Program and the documents which implement the Program. Some of these definitions come directly from regulatory documents and others come from SNC and Site procedures. The Site and SNC procedure definitions take precedence over this drawing.

#### 3.1 NFPA 805 and Related Definitions

**Acceptable.** Considered by the authority having jurisdiction (AHJ) as adequate for satisfying the goals, performance objectives, and/or performance criteria.

**Approved.** Acceptable to the authority having jurisdiction.

**Authority Having Jurisdiction.** The organization, office, or individual responsible for approving equipment, materials, an installation, or a procedure. [The NRC is the AHJ for purposes of nuclear health and safety and common defense and security.]

**Availability.** The probability that the system, structure, or component of interest is functional at a given point in time.

**Combustible.** Capable of undergoing combustion.

**Combustible Liquid.** A liquid having a flash point at or above 100°F (37.8°C). (See NFPA 30, Flammable and Combustible Liquids Code.)

**Compensatory Actions.** Actions taken if an impairment to a required system, feature, or component prevents that system, feature, or component from performing its intended function. These actions are a temporary alternative means of providing reasonable assurance that the necessary function will be compensated for during the impairment, or an act to mitigate the consequence of a fire. Compensatory measures include but are not limited to actions such as fire watches, administrative controls, temporary systems, and features of components.

**Containment.** Structures, systems, or components provided to prevent or mitigate the release of radioactive materials.

**Core Damage Frequency (CDF)** – The metric used to determine the significance of the outcome of the Level 1 PRA model on a per year basis. It is the sum of the accident sequence frequencies of which the end state is core damage.

**Defense-in-Depth.** Defense-in-depth shall be achieved when an adequate balance of each of the following elements is provided:

- (1) Preventing fires from starting
- (2) Rapidly detecting fires and controlling and extinguishing promptly those fires that do occur, thereby limiting fire damage
- (3) Providing an adequate level of fire protection for structures, systems, and components important to safety, so that a fire that is not promptly extinguished will not prevent essential plant safety functions from being performed

**Deterministic Approach.** A deterministic approach establishes requirements for engineering margin and quality assurance in design, manufacture, and construction. It involves implied, but unquantified, elements of probability in the selection of the specific accidents to be analyzed as design basis events. It does not integrate results in a comprehensive manner to assess the overall impact of postulated initiating events.

**Electrical Raceway Fire Barrier System (ERFBS).** Non-load-bearing partition-type envelope system installed around electrical components and cabling that have withstood a fire exposure as established in accordance with an approved test procedure and are rated by a test laboratory in hours of fire resistance and are used to maintain specified nuclear safety functions free of fire damage.

**Essential Personnel.** Personnel who are required to perform functions to mitigate the effects of a fire including but not limited to industrial fire brigade members, operations, health physics, security, and maintenance.

**Fire Area.** An area that is physically separated from other areas by space, barriers, walls, or other means in order to contain fire within that area.

**Fire Barrier.** A continuous vertical or horizontal construction assembly designed and constructed to limit the spread of heat and fire and to restrict the movement of smoke.

**Fire Door.** A door assembly rated in accordance with NFPA 252, Standard Methods of Fire Tests of Door Assemblies, and installed in accordance with NFPA 80, Standard for Fire Doors and Fire Windows.

**Fire Hazard Analysis (FHA).** An analysis to evaluate potential fire hazards and appropriate fire protection systems and features used to mitigate the effects of fire in any plant location.

**Fire Model.** Mathematical prediction of fire growth, environmental conditions, and potential effects on structures, systems, or components based on the conservation equations or empirical data.

**Fire Prevention.** Measures directed towards reducing the likelihood of fire.

**Fire Probabilistic Risk Assessment (FPRA)** – A Fire Probabilistic Risk Assessment determines the risk (core damage frequency and large early release frequency) of a fire originating at an ignition source that damages a target cable or piece of equipment.

**Fire Protection Feature.** Administrative controls, fire barriers, means of egress, industrial fire brigade personnel, and other features provided for fire protection purposes.

**Fire Protection Program (FPP).** The Station Fire Protection Program consists of activities and functions that are performed to minimize the probability and consequences of a postulated fire. In the event of a fire, the program and system designs ensure the capability to shut down the reactor and maintain it in a safe and stable (achieve and maintain safe shutdown) shutdown condition. This includes:

- Classical fire protection elements of fire detection and suppression systems and equipment (including active as well as passive design features) and programmatic/organizational elements for minimizing the chance of fire occurring and ensuring minimal impact should one occur.
- NSCA – Safe Shutdown Capability, the nuclear plant's design capability to achieve Safe Shutdown (Appendix R or CMEB 9.5-1 / NUREG-0800 licensed plants) or Nuclear Safety Capability Safe and Stable (NFPA 805 licensed plants) conditions in the event of a single damaging fire.
- A supporting Fire PRA that provides both overall and detailed risk insights.
- Radioactive Release.
- Non-Power Operations

**Fire Protection System.** Fire detection, notification, and fire suppression systems designed, installed, and maintained in accordance with the applicable NFPA codes and standards.

**Fire Resistance Rating.** The time, in minutes or hours, that materials or assemblies have withstood a fire exposure as established in accordance with an approved test procedure appropriate for the structure, building material, or component under consideration.

**Fire Risk Evaluation (FRE).** An integrated assessment of the acceptability of risk, defense-in-depth, and safety margins. The evaluation compares the risk associated with implementation of the deterministic requirements with the proposed performance-based alternative. The difference of risk between the two approaches shall meet specified risk acceptance criteria, maintain the defense-in-depth philosophy and provide sufficient safety margin.

**Fire Safety Analysis (FSA).** A document that integrates/includes fire hazards identification and nuclear safety capability assessment, on a fire area basis, for each fire area that could affect the nuclear safety or radioactive release performance criteria of NFPA 805. This information is based on those documents, analyses, engineering evaluations, calculations and so forth that define the fire protection design basis for the plant.

**Fire Scenario.** A description of a fire and any factors affecting or affected by it from ignition to extinguishment, including, as appropriate, ignition sources, nature and configuration of the fuel, ventilation characteristics and locations of occupants, condition of the supporting structure, and conditions and status of operating equipment.

**Fire Zone.** A subdivision of a fire area not necessarily bounded by fire-rated assemblies. Fire zone can also refer to the area subdivisions of a fire detection or suppression system, which provide alarm indications at the central alarm panel.

**Fixed Combustible Material** – Any combustible material that is attached to the plant structure, attached to or contained within fixed plant equipment, or permanently installed in the plant, and which in the form it is used, and under the conditions anticipated, will ignite, burn, support combustion, or release flammable vapors when subjected to fire or heat. This definition includes electrical cable insulation within a cable tray or other exposed cable route, regardless of their rating by IEEE-383 flame test, UL-910, or other specification.

**Flame Spread Rating.** A relative measurement of the surface burning characteristics of building materials when tested in accordance with NFPA 255, Standard Method of Test of Surface Burning Characteristics of Building Materials.

**Flammable Liquid.** Any liquid having a flash point below 100°F (37.8°C) and having a vapor pressure not exceeding 40 psi (276 kPa) absolute pressure at 100°F (37.8°C).

**Free of Fire Damage.** The structure, system, or component under consideration is capable of performing its intended function during and after the postulated fire, as needed.

**Fuel Damage.** Exceeding the fuel design limits.

**High-Low Pressure Interface.** Reactor coolant boundary valves whose spurious opening could potentially rupture downstream piping on an interfacing system or could cause a loss of inventory that could not be mitigated in sufficient time to achieve the nuclear safety performance criteria.

**Higher Risk Evolution.** Outage activities, plant configurations or conditions during shutdown where the plant is more susceptible to an event causing the loss of a Key Safety Function such as decay heat removal or electrical power.

**Ignition Source** – A piece of equipment or activity that is capable of causing a fire or explosion, such as open flames, sparks, or hot surfaces. The following are examples of ignition sources

- Air Compressor
- Battery
- Battery Charger
- Electrical, Control, and Switch Panels and boxes.
- Exclusions from counting process:
  - Panels that are part of installation machinery
  - Sample wall-mounted panels housing less than four switches
- Dryers
- Hydrogen Tank
- Hydrogen Mitigation System glow plugs or coils
- Electric Motor (greater than 5 HP)
- H2 Recombiner
- Pump
- Switchgear, Motor Control Centers, DC Distribution Panels
- Transformer (dry or oil-filled, greater than 45 kVA)
- Load Centers, Motor Control Centers, Power Panels, Lighting Panel
- Internal Combustion Engines

**Industrial Fire Brigade.** An organized group of employees within an industrial occupancy who are knowledgeable, trained, and skilled in at least basic fire-fighting operations, and whose full-time occupation might or might not be the provision of fire suppression and related activities for their employer.

**In Situ Combustible.** Combustible materials that are permanently located in a room or an area (e.g., cable insulation, lubricating oil in pumps).

**Labeled.** Equipment or materials to which has been attached a label, symbol, or other identifying mark of an organization that is acceptable to the authority having jurisdiction and concerned with product evaluation, that maintains periodic inspection of production of labeled equipment or materials, and by who's labeling the manufacturer indicates compliance with appropriate standards or performance in a specified manner.

**Large Early Release.** Significant, unmitigated release from containment in a time frame prior to effective evacuation of the close-in population such that there is a potential for early health effects. (Regulatory Guide 1.174) Frequency for those accidents leading to a large, rapid, unmitigated release of airborne fission products from the containment to the environment occurring before the effective implementation of offsite emergency response and protective actions such that there is the potential for early health effects. Such accidents generally include unscrubbed releases associated with early containment failure shortly after vessel breach, containment bypass events, and loss of containment isolation.

**Limited Combustible.** Material that, in the form in which it is used, has a potential heat value not exceeding 3500 Btu/lb (8141 kJ/kg) and either has a structural base of noncombustible material with a surfacing not exceeding a thickness of 1/8 in. (3.2 mm) that has a flame spread rating not greater than 50, or has another material having neither a flame spread rating greater than 25 nor evidence of continued progressive combustion, even on surfaces exposed by cutting through the material on any plane. (See NFPA 220, Standard on Types of Building Construction.)

**Listed.** Equipment, materials, or services included in a list published by an organization that is acceptable to the authority having jurisdiction and concerned with evaluation of products or services, that maintains periodic inspection of production of listed equipment or materials or periodic evaluation of services, and whose listing states that either the equipment, material, or service meets appropriate designated standards or has been tested and found suitable for a specified purpose.

**Monitoring.** A structured assessment function or process to ensure that 1) availability and reliability of selected fire protection SSC's is maintained at desired levels and 2) the performance of the fire protection program meets performance criteria. Monitoring shall ensure that the assumptions in the engineering analyses are maintained for performance-based, risk-informed fire protection programs.

**Noncombustible Material.** A material that, in the form in which it is used and under the conditions anticipated, will not ignite, burn, support combustion, or release flammable vapors when subjected to fire or heat.

**Nuclear Safety Capability Assessment (NSCA).** A collection of analyses used to determine that at least one train of plant systems and equipment is available to support safe and stable plant control in any mode in the event of a postulated fire in any area of the power block.

**Owner/Operator.** The organization(s) with fiscal responsibility for the operation, maintenance, and profitability of the nuclear plant.

**Non Power Operation (NPO) –** In the context of the FP/SSD program, NPO refers to the procedural controls placed on plant operations and operational conditions while the plant is shut down.

**Performance Criteria.** Specific measurable or calculable parameters for systems and features that are quantified and described in engineering terms.

**Performance-Based Approach.** A performance-based approach relies upon measurable (or calculable) outcomes (i.e., performance results) to be met but provides more flexibility as to the means of meeting those outcomes. A performance-based approach is one that establishes performance and results as the primary basis for decision-making and incorporates the following attributes: (1) Measurable or calculable parameters exist to monitor the system, including facility performance; (2) Objective criteria to assess performance are established based on risk insights, deterministic analyses, and/ or performance history; (3) Plant operators have the flexibility to determine how to meet established performance criteria in ways that will encourage and reward improved outcomes; and (4) A framework exists in which the failure to meet a performance criteria, while undesirable, will not in and of itself constitute or result in an immediate safety concern.

**Pinch Point.** A plant location containing a configuration of cables and equipment that in the event of fire could result in the loss of all success paths for one or more evaluated Key Safety Functions (KSFs) during plant shutdown. KSFs include Decay Heat Removal, Inventory Control, Power Availability and others.

**Power Block.** Structures that have equipment required for nuclear plant operations.

**Primary Control Station.** A designed station to facilitate plant control outside of the Control Room.

**Probabilistic Safety Assessment (PSA).** A comprehensive evaluation of the risk of a facility or process; also referred to as a probabilistic risk assessment (PRA).

**Radiant Energy Shield.** A device utilized to protect components from the effects of radiant heat generated by a fire.

**Recovery Action.** Activities to achieve the nuclear safety performance criteria that take place outside of the main control room or outside of the primary control station(s) for the equipment being operated, including the replacement or modification of components.

**Reliability.** The probability that the system, structure, or component of interest will function without failure for a given interval of time or number of cycles. For standby systems, structures, or components, this includes the probability of success upon demand.

**Request for Additional Information (RAI).** NRC process associated with formal licensing actions (e.g., License Amendment Request) to obtain additional information from licensee.

**Risk.** The set of probabilities and consequences for all possible accident scenarios associated with a given plant or process.

**Risk Informed Approach.** A philosophy whereby risk insights are considered together with other factors to establish performance requirements that better focus attention on design and operational issues commensurate with their importance to public health and safety.

**Safe and Stable Conditions.** For fuel in the reactor vessel, head on and tensioned, safe and stable conditions are defined as the ability to maintain  $K_{eff} < 0.99$ , with a reactor coolant temperature at or below the requirements for hot shut down for a boiling water reactor and hot standby for a pressurized water reactor. For all other configurations, safe and stable conditions are defined as maintaining  $K_{eff} < 0.99$  and fuel coolant temperature below boiling.

**Shall.** Indicates a mandatory requirement.

**Site.** Refers to the contiguous property that makes up a nuclear power plant facility. This would include areas both inside the protected area and the owner-controlled property.

**Should.** Indicates a recommendation or that which is advised but not required.

**Source Term Limitation.** Limiting the source of radiation available for release.

**Spurious Operation.** An unwanted change in state of equipment due to fire-induced faults (e.g., hot shorts, open circuits, or shorts to ground) on its power or control circuitry.

**Through Penetration Fire Stop.** A tested, fire-rated construction consisting of the materials that fill the openings through the wall or floor opening around penetrating items such as cables, cable trays, conduits, ducts, and pipes and their means of support to prevent the spread of fire.

### 3.2 Plant Definitions

**ArcPlus™.** Trademarked software that provides a graphical user interface to support the analysis of fire scenario-based safe and stable or safe shutdown compliance. The software links to existing safe shutdown databases and cable and raceway databases to support the Nuclear Safety Capability Assessment for power and non-power modes. The software is a controlled QA database and contains the source data and enables printing of the Appendices C, D and F of this document.

**Safe and Stable.** Following the reactor trip, the plant will be placed in a known safe and stable condition, hot standby. In hot standby, a natural circulation cooldown resulting from a loss of offsite power will be initiated to transition to the next safe and stable mode of hot shutdown. Assuming complete loss of offsite power is regarded as the most conservative method and limits the scope of analysis to those SSCs powered from the diesel generators and batteries. At this point in time, the analysis for safe and stable in non-power operational modes also begins and is enveloped by the cooldown from at power. Emergency feedwater operation continues and steam is released from one or more steam generators to remove decay heat. Charging continues to account for the RCS shrinkage and expected losses and utilizes borated water to maintain reactivity shutdown margins. Pressure is reduced via operation of the pressurizer auxiliary spray valve or the pressurizer Power Operated Relief Valves (PORVs).

When plant temperature is less than approximately 350°F and pressure is less than approximately 425 psig, the Residual Heat Removal (RHR) system will be placed in service. The plant will continue to cool down as the component cooling water system transfers heat to the service water system. In this manner, plant temperature will be reduced below 200° F and cold shutdown.

Depending upon the location and extent of the fire, the unit may be maintained in any one of the safe and stable modes described above for an extended period of time until the readiness of the systems necessary for the next safe and stable mode on the cooldown timeline can be verified to be operational. The ability to maintain safe and stable conditions at a particular mode for extended periods (generally regarded as greater than 24 hours) may require additional actions such as replenishment of diesel fuel oil, replenishment of borated injection water, or replenishment of condensate supplies and can be performed by the Site's Emergency Response Organization.

**Pre-Fire Plans.** Documents that detail each fire area configuration and fire hazards to be encountered in the fire area, along with any nuclear safety components and fire protection systems and features that are present. Pre-Fire Plans are available and shall be utilized by the Fire Brigade for all areas in which a fire could jeopardize the ability to meet the performance criteria of NFPA 805.

## 4.0 DESIGN BASIS

### 4.1 NFPA 805 Methodology

#### 4.1.1 Compliance Requirements

The general approach for compliance with NFPA 805 is outlined in Chapter 2 and consists of the following steps (See Figure 4-1):

- “(a) Establish the fundamental fire protection program (see NFPA 805 Chapter 3).*
- (b) Identify fire areas and associated fire hazards.*
- (c) Identify the performance criteria that apply to each fire area (see NFPA 805 Section 1.5).*
- (d) Identify systems, structures, and components (SSCs) in each fire area to which the performance criteria apply.*
- (e) Select the deterministic and/or performance-based approach for the performance criteria (see NFPA 805 Chapter 4).*
- (f) When applying a deterministic approach, demonstrate compliance with the deterministic requirements (see NFPA 805 Chapter 4).*
- (g) When applying a performance-based approach, perform engineering analyses to demonstrate that performance based requirements are satisfied. These analyses shall include, for example, engineering evaluations, probabilistic safety assessments, or fire modeling calculations (see NFPA 805 Section 2.4).”*

In addition to the analyses performed to demonstrate compliance with 10 CFR 50.48 (a) and (c), the following are also required for fire protection program maintenance:

- “(h) Perform the plant change evaluation that demonstrates that changes in risk, defense-in-depth, and safety margins are acceptable (see NFPA 805 2.4.4). If any one of these is unacceptable, additional fire protection features or other alternatives shall be implemented.*
- (i) Develop a monitoring program to monitor plant performance as it applies to fire risk. This program shall provide feedback for adjusting the fire protection program, as necessary (see NFPA 805 Section 2.6).*
- (j) For the resulting plant fire protection program, provide adequate documentation, ensure the quality of the analyses, and maintain configuration control of the resulting plant design and operation (see NFPA 805 Section 2.7).”*

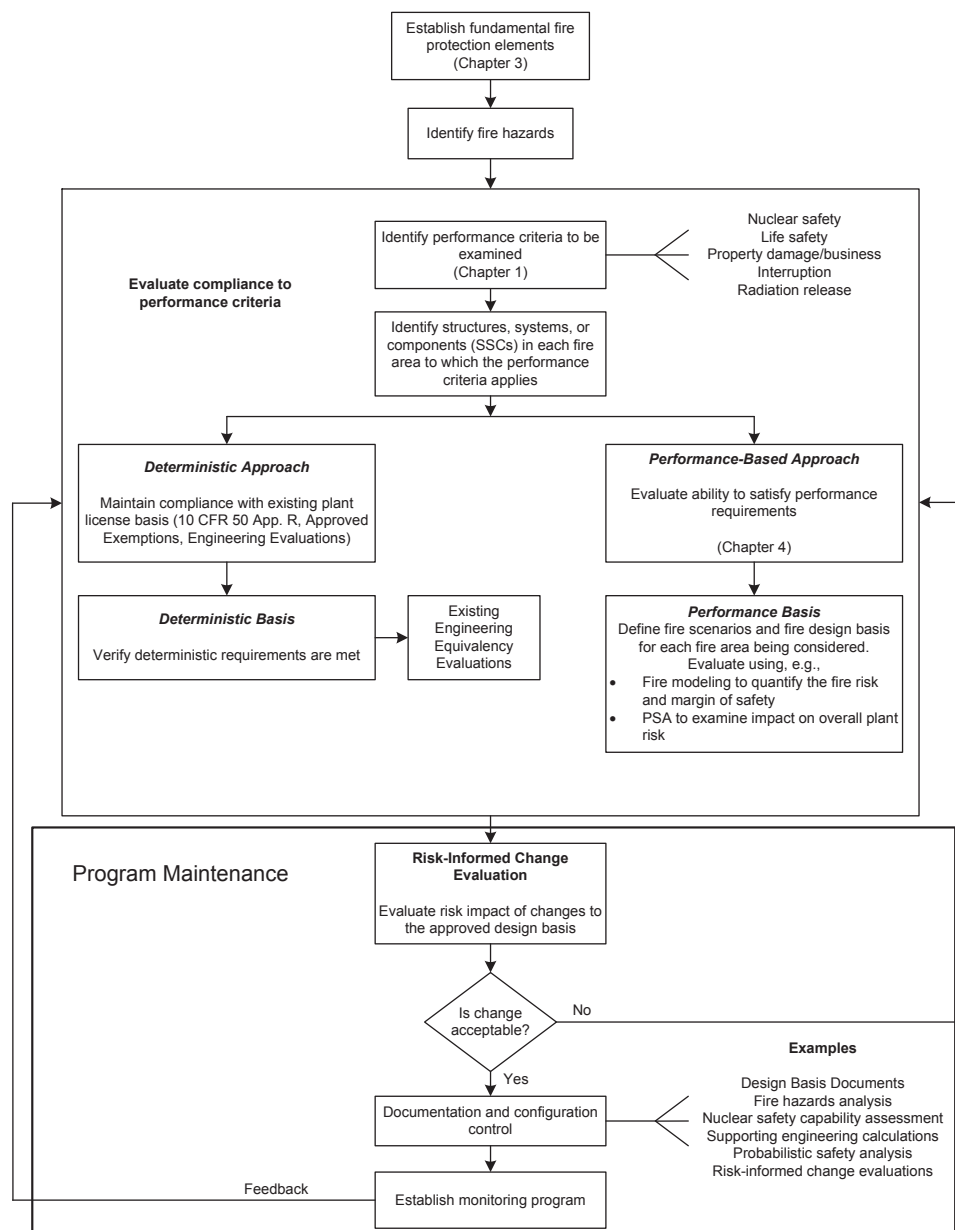

Figure 4-1 NFPA 805 Process [Based on Figure 2-2 of NFPA 805]<sup>1</sup>

#### 4.1.2 FNP Results

As used in NFPA 805 Chapter 3, the terms ‘Power Block’ and ‘Plant’ refer to structures that contain equipment required for nuclear plant operations. All structures within the Farley Nuclear Plant Owner Controlled Area were reviewed to determine the potential impact of fire on the nuclear safety and radioactive release criteria described in Section 1.5 of NFPA 805.

<sup>1</sup> 10 CFR 50.48(c) does not endorse Life Safety and Plant Damage/Business Interruption goals, objectives and criteria. See 10 CFR 50.48 (c) for specific exceptions to the endorsement of NFPA 805.

This was accomplished by identifying the structures that contain either:

- Equipment that could affect:
  - Plant operation for power generation
  - Equipment important to safety
  - Ability to maintain nuclear safety performance criteria in the event of a fire

OR

- Radioactive materials that could potentially be released in event of a fire.

This Power Block review is documented in SNC calculation SM-C051326701-008. The Farley Nuclear Plant Power Block, Fire Areas and Fire Zones are listed in Appendix B.

The initial review of the Nuclear Safety Capability Assessment (NSCA) methodology described in NFPA 805 Chapter 2 was performed to ensure compliance and was documented in SNC calculation SE-C051326701-006. This calculation is now a historical document. The methodology comparison is now maintained in the ArcPlus™ database and a copy is provided in Appendix C.

#### 4.1.3 NRC Acceptance

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c) dated March 10, 2015 (Section 3.2.1.6):

*“The NRC staff reviewed the documentation provided by the licensee describing the process used to perform the NSCA required by NFPA 805, Section 2.4.2. The licensee performed this evaluation by comparing the SSA against the NFPA 805 NSCA requirements using NEI 00-01, Revision 1, and also conducted a gap analysis between Revisions 1 and 2 of NEI 00-01 to determine if any discrepancies existed.”*

*“Based on the information provided in the licensee’s submittal, as supplemented, the NRC staff accepts the method the licensee used to perform the NSCA with respect to the selection of systems and equipment, selection of cables, and identification of the location of nuclear safety equipment and cables, as required by NFPA 805, section 2.4.2.”*

#### 4.1.4 Ongoing Compliance Maintenance

Changes to the Power Block definition or NSCA methodology would be processed as an engineering change to calculation SM-C051326701-008 or the ArcPlus™ database, respectively. Each change would also undergo a Fire Protection Program change evaluation in accordance with NMP-ES-035-006, Fire Protection Program Impact Screening and Detailed Reviews, to ensure continued compliance with the fire protection licensing basis and determine if NRC approval was required prior to implementation of the change.

## 4.2 Fundamental Fire Protection Program and Design Elements

### 4.2.1 Compliance Requirements

The Fundamental Fire Protection Program and Design Elements are established in Chapter 3 of NFPA 805. Section 4.3.1 of NEI 04-02 provided a systematic process for determining the extent to which the Current License Basis and plant configuration meet these criteria and for identifying the Fire Protection Program (FPP) changes that would be necessary for compliance with NFPA 805. NEI 04-02 Appendix B-1 provides guidance for documenting the comparison of the Fire Protection Program requirements of NFPA 805 Chapter 3 to the FNP Fire Protection Program.

Each section/subsection of NFPA 805 Chapter 3 was reviewed against the then-existing FNP FPP (pre-transition) to determine that FNP achieved compliance in one of the following manners by demonstrating the existing FPP element:

- Directly complies with the requirement. (Complies)
- Complies through the use of an explanation or clarification. (Complies with Clarification)
- Complies through the use of EEEEs whose bases remained valid and are of sufficient quality. (Complies via Engineering Evaluation)
- Complies with the requirement based on prior NRC approval of an alternative to the fundamental FPP attribute and the bases remain valid. (Complies via Previous NRC Approval)
- Did not comply with the requirement but licensee requested specific approval for a performance-based (PB) method. (Submit for NRC Approval)

### 4.2.2 FNP Results

The comparison of the FNP FPP to NFPA 805 Chapter 3 was originally documented in calculation SM-C051326701-003, NFPA 805 Transition – B-1 Table Calculation. This calculation is now a historical document. The comparison is now maintained in the ArcPlus™ database and a copy is provided in Appendix D.

#### 4.2.2.1 Code Compliance Evaluations

Code compliance evaluations were conducted and documented for the following associated Chapter 3 sections/subsections in calculations SM-C051326701-007, NFPA 805 – NFPA Code Compliance Review, and SM-C051326701-001, NFPA 600 Code Compliance Review.

Summarized below is the NFPA 805 section that identifies the fire protection element, the related NFPA code, if the code is a Farley commitment and if so, the code of record (year) as documented in SM-C051326701-007:

- 3.3.1.2 (5) Controls on use and storage of flammable and combustible liquids – NFPA 30, Flammable and Combustible Liquids Code. Farley Commitment – Yes. Code of Record – 1972.
- 3.3.1.3.1 Hot work safety procedure – NFPA 51B, Standard for Fire Prevention During Welding, Cutting, and Other Hot Work. Farley Commitment – Yes. Code of Record – 2003.
- 3.3.7.1 Bulk flammable gas storage – NFPA 55, Storage, Use and Handling of Compressed Gases and Cryogenic Fluids. Farley Commitment – Yes. Code of Record – 2005.
- 3.4.1(a)(1) On-site firefighting capability – NFPA 600, Standard on Industrial Fire Brigades. Farley Commitment – Yes. Code of Record – 2005.

- 3.5.2 Water supply tank requirements – NFPA 22, Water Tanks for Private Fire Protection. Farley Commitment – Yes. Code of Record – 1970.
- 3.5.3 Water supply pump requirements – NFPA 20, Stationary Pumps for Fire Protection. Farley Commitment – Yes. Code of Record – 1974.
- 3.5.10 Water supply yard main requirements – NFPA 24, Private Fire Service Mains. Farley Commitment – Yes. Code of Record - 1973
- 3.6.1 Standpipe and hose station requirements – NFPA 14, Standard for the Installation of Standpipe, Private Hydrant, and Hose Systems. Farley Commitment – Yes. Code of Record – 1976.
- 3.7 Fire extinguishers – NFPA 10, Standard for Portable Fire Extinguishers. Farley Commitment – Yes. Code of Record – 1973.
- 3.8.1 Fire alarm – NFPA 72, National Fire Alarm Code. Modification to upgrade the system Code of Record - 2007
- 3.9.1 Fire suppression system requirements – NFPA 13, Standard for the Installation of Sprinkler Systems; NFPA 15, Standard for Water Spray Fixed Systems for Fire Protection. Farley Commitment – Yes. Code of Record – 1975 for all but pre-action sprinklers in the power block have code year 1976.
- 3.10.1 Gaseous suppression system requirements – NFPA 12, Standard on Carbon Dioxide Extinguishing Systems; NFPA 12A, Standard of Halon 1301 Fire Extinguishing Systems. Farley Commitment – Yes. Code of Record – 1973.
- 3.11.3(1) Fire barrier penetrations – NFPA 80, Standard for Fire Doors and Fire Windows. Farley Commitment – Yes. Code of Record – 1973.
- 3.11.3(2) Fire barrier penetrations – NFPA 90A, Standard for the Installation of Air-Conditioning and Ventilating Systems. Farley Commitment – Yes. Code of Record – 1974.

#### 4.2.2.2 Engineering Evaluations of NFPA 805 Chapter 3 Items

Compliance through Engineering Evaluations (separate from Code Compliance Evaluations) and NRC Previously Approved Variations of Chapter 3 sections/subsections are as follows:

- 3.6.4 Standpipe and hose station earthquake provisions – FNP is not required to have seismically qualified standpipes and hose stations because its construction permit date meets the NRC exemption for this requirement.
- 3.11.1 Building separation – A formal Engineering Evaluation was performed to ensure adequate compliance for building fire separation. (Calculation SM-C051326701-006, Identify Regulatory Fire Barriers)
- 3.11.2 Fire barriers – A calculation was performed that identifies all regulatory fire barriers and defines their physical boundaries. (Calculation SM-C051326701-006, Identify Regulatory Fire Barriers)
- 3.11.4 (a) Through Penetration Fire Stops – Penetration seal assemblies that vary from existing seal details and specifications and that can be justified through engineering analysis are acceptable for installation. (Calculation SM-C051326701-006, Identify Regulatory Fire Barriers)

#### 4.2.2.3 Submitted for NRC Approval

Requirements that did not comply but that were submitted for NRC Approval are as follows with section/subsection number listed first:

- 3.3.5.1 – Requested the use of PB methods to demonstrate an equivalent level of fire protection for existing wiring above suspended ceilings that may not be plenum rated or routed in armored cable, metallic conduit or cable trays with solid metal top and bottom covers.
- 3.3.5.2 – Requested the use of plastic embedded conduit installations versus metal conduit.
- 3.3.12(1) – Requested that oil misting not be included in the scope of lubricating oil collection systems for reactor coolant pumps.
- 3.5.15 – Requested the use of PB methods to demonstrate an equivalent level of fire protection for hydrant spacing that does not meet specified criteria.
- 3.5.16 – Requested approval for use of fire protection system water for plant evolutions other than fire protection.

The information was originally documented in calculation SM-C051326701-003 and included references to the document(s) that justify these positions. This calculation is now a historical document. The comparisons and justification references are now maintained in the ArcPlus™ database and a copy is provided in Appendix D.

#### 4.2.3 NRC Acceptance

The NRC staff concluded in their March 10, 2015 Safety Evaluation (Section 3.1.1.8) that the fundamental fire protection program elements and minimum design requirements of NFPA 805, as modified by 10 CFR 50.48(c)(2) are acceptable.

#### 4.2.4 Ongoing Compliance Maintenance

Changes to the fundamental fire protection program elements and design requirements comparison, code compliance reviews, or engineering evaluations would be processed as an engineering change to the ArcPlus™ database, or calculations SM-C051326701-007, SM-C051326701-001, or SM-C051326701-006, respectively. Each change would also undergo a Fire Protection Program change evaluation in accordance with NMP-ES-035-006, Fire Protection Program Impact Screening and Detailed Reviews, to ensure continued compliance with the fire protection licensing basis and determine if NRC approval was required prior to implementation of the change.

### 4.3 Nuclear Safety Performance Criteria (NSPC)

#### 4.3.1 Compliance Requirements

NFPA 805 is a risk-informed/performance-based (RI/PB) standard that allows engineering analyses to be used to show that FPP features and systems provide sufficient capability to meet the requirements of 10 CFR 50.48(c).

NFPA 805, Section 2.4, "Engineering Analyses," states that:

*"Engineering analysis is an acceptable means of evaluating a fire protection program against performance criteria. Engineering analyses shall be permitted to be qualitative or quantitative in accordance with Figure 2.4 [of NFPA 805]."*

*The effectiveness of the fire protection features shall be evaluated in relation to their ability to detect, control, suppress, and extinguish a fire and provide passive protection to achieve*

*the performance criteria and not exceed the damage threshold defined in Section [2.5] for the plant area being analyzed."*

Chapter 1 of the standard defines the goals, objectives and performance criteria that the FPP must meet in order to be in accordance with NFPA 805. NFPA 805, Section 1.3.1 "Nuclear Safety Goal," states that:

*"The nuclear safety goal is to provide reasonable assurance that a fire during any operational mode and plant configuration will not prevent the plant from achieving and maintaining the fuel in a safe and stable condition."*

NFPA 805, Section 1.4.1 "Nuclear Safety Objectives," states that:

*"In the event of a fire during any operational mode and plant configuration, the plant shall be as follows:*

- 1) Reactivity Control. Capable of rapidly achieving and maintaining subcritical conditions;*
- 2) Fuel Cooling. Capable of achieving and maintaining decay heat removal and inventory control functions; and*
- 3) Fission Product Boundary. Capable of preventing fuel clad damage so that the primary containment boundary is not challenged."*

These high level safety objectives are used to establish the design requirements of the FPP, including more detailed Nuclear Safety Performance Criteria (NSPC) and the method utilized for applying the performance criteria, the Nuclear Safety Capability Assessment (NSCA).

NFPA 805, Section 1.5.1 "Nuclear Safety Performance Criteria," states that:

*"Fire protection features shall be capable of providing reasonable assurance that, in the event of a fire, the plant is not placed in an unrecoverable condition. To demonstrate this, the following performance criteria shall be met.*

- a) Reactivity Control. Reactivity control shall be capable of inserting negative reactivity to achieve and maintain subcritical conditions. Negative reactivity inserting shall occur rapidly enough such that fuel design limits are not exceeded;*
- b) Inventory and Pressure Control. With fuel in the reactor vessel, head on and tensioned, inventory and pressure control shall be capable of controlling coolant level such that sub-cooling is maintained for a PWR and shall be capable of maintaining or rapidly restoring reactor water level above top of active fuel for a BWR such that fuel clad damage as a result of a fire is prevented;*
- c) Decay Heat Removal. Decay heat removal shall be capable of removing sufficient heat from the reactor core or spent fuel such that fuel is maintained in a safe and stable condition;*
- d) Vital Auxiliaries. Vital auxiliaries shall be capable of providing the necessary auxiliary support equipment and systems to assure that the systems required under (a), (b); (c), and (e) are capable of performing their required nuclear safety function; and*
- e) Process Monitoring. Process monitoring shall be capable of providing the necessary indication to assure the criteria addressed in (a) through (d) have been achieved and are being maintained."*

### 4.3.2 FNP Results

The NSPC were achieved through deterministic approaches (NFPA 805 Section 4.2.3, including engineering evaluations and previously approved licensing actions) and performance-based approaches. In cases where neither approach could meet the NSPC, a modification to the plant design was required.

Table 4-1 lists the documented calculations completed to verify achievement of the NSPC for each fire area at Farley Nuclear Plant. The current information is housed in the active calculations listed on the table and in the ARCPlus™ database for those calculations listed as historical. Appendix F provides an informational use summary of the results of this review and summarizes how the NSPC is met for each analyzed fire area.

**Table 4-1: Nuclear Safety Calculations**

#### 4.3.2.1 Multiple Spurious Operations (MSO) Overview

NFPA 805 Section 2.4.2.2.1, "Circuits Required in Nuclear Safety Functions," states, in part, that:

*"Circuits required for the nuclear safety functions shall be identified. This includes circuits that are required for operation, that could prevent the operation, or that result in the maloperation of the equipment identified in 2.4.2.1. Nuclear Safety Capability Systems and Equipment Selection. This evaluation shall consider fire-induced failure modes such as hot shorts*

*(external and internal), open circuits, and shorts to ground, to identify circuits that are required to support the proper operation of components required to achieve the nuclear safety performance criteria, including spurious operation and signals.”*

In addition, NFPA 805, Section 2.4.3.2, states that:

*“The PSA evaluation shall address the risk contribution associated with all potentially risk-significant fire scenarios”*

Because the risk-informed/performance-based approach utilized Fire Risk Evaluations (FRE) in accordance with NFPA 805 Section 4.2.4.2, "Use of Fire Risk Evaluation," adequately identifying and including potential multiple spurious operation (MSO) combinations was accomplished to ensure that all potentially risk-significant fire scenarios were evaluated.

#### **4.3.2.2 MSO Methodology**

The review and evaluation process to determine susceptibility to fire-induced MSOs was conducted in accordance with NEI 04-02 and RG 1.205, as supplemented by FAQ 07-0038. The approach uses insights from the Fire PRA and consists of the following:

- a) Identifying potential MSOs of concern
- b) Conducting an expert panel to assess plant specific vulnerabilities (e.g., per NEI 00-01, Revision 1 Section F.4.2)
- c) Updating the Fire PRA model and new NSCA to include the MSOs of concern
- d) Evaluating for NFPA 805 compliance
- e) Documenting results

MSOs identified previously were incorporated in the Fire PRA model and evaluated for inclusion in the NSCA. Where MSO combinations did not meet the deterministic requirements of NFPA 805, they were addressed using the PB approach of NFPA 805, Section 4.2.4. Based on the evaluations, components associated with MSOs were added to the NSCA equipment list and logics and cable tracing and circuit analysis was performed. Additionally, the Fire PRA quantified the fire-induced risk model containing the MSO pathways and the MSO contribution was included in the Fire PRA results.

#### **4.3.2.3 At-Power Considerations**

NFPA 805 Section 2.4.2 requires:

*“The purpose of this section is to define the methodology for performing a nuclear safety capability assessment. The following steps shall be performed:*

- a. Selection of systems and equipment and their interrelationships necessary to achieve the nuclear safety performance criteria in Chapter 1*
- b. Selection of cables necessary to achieve the nuclear safety performance criteria in Chapter 1*
- c. Identification of the location of nuclear safety equipment and cables*
- d. Assessment of the ability to achieve the nuclear safety performance criteria given a fire in each fire area*

*Steps 1 through 4 shall be performed to determine equipment and cables that shall be evaluated using either the deterministic or performance-based method in Chapter 4.”*

The NSCA methodology review evaluated the (pre-transition) post-fire Safe Shutdown Analysis (SSA) methodology against the guidance provided in NEI 00-01, Revision 1, Chapter 3, Deterministic Methodology, as discussed in Appendix B-2 of NEI 04-02.

This comparison was documented in LAR Table B-2, and the current information is housed in the calculation SE-C0513026701-006. The nuclear safety goals, objectives and performance criteria of NFPA 805 allow more flexibility than the previous deterministic programs based on 10 CFR 50, Appendix R and NUREG 0800, Section 9.5-1 (and NEI 00-01, Chapter 3). NFPA 805 only requires the licensee to maintain the fuel in a safe and stable condition rather than achieve and maintain cold shutdown.

NFPA 805, Section 1.6.56, defines Safe and Stable conditions as follows:

*“For fuel in the reactor vessel, head on and tensioned, safe and stable conditions are defined as the ability to maintain  $K_{eff} < 0.99$ , with a reactor coolant temperature at or below the requirements for hot shutdown for a boiling water reactor and hot standby for a pressurized water reactor. For all other configurations, safe and stable conditions are defined as maintaining  $K_{eff} < 0.99$  and fuel coolant temperature below boiling.”*

The nuclear safety goal of NFPA 805 requires “...reasonable assurance that a fire during any operational mode and plant configuration will not prevent the plant from achieving and maintaining the fuel in a safe and stable condition” without a specific reference to a mission time or event coping duration.

For the plant to be in a safe and stable condition, it may not be necessary to perform a transition to cold shutdown as previously required under 10 CFR 50, Appendix R. Therefore, the unit may remain at or below the temperature defined by a hot standby plant operating state for the event.

The NSCA results were documented in SNC Calculation SE-C051326701-010, NFPA 805 NSCA Transition – Table B-3 – Fire Area Review. The review documents for each Fire Area:

- Whether a deterministic or performance-based approach was utilized in accordance with NFPA 805 Sections 4.2.3 or 4.2.4, respectively;
- Methods of Accomplishment to meet the various Nuclear Safety Performance Goals;
- Fire Protection Systems and Features required to meet the NSPC;
- An evaluation of the effects of fire suppression activities on the ability to achieve the NSPC; and
- Acceptability of Engineering Equivalency Evaluations.

This original Table B-3 calculation along with calculations SE-C051326701-004 and SE-C051326701-008 were developed for the LAR and have since been made historical. In the case of SNC Calculation SE-C051326701-010, the title has been revised to, “Nuclear Safety Capability Assessment - Fire Area Compliance Assessment,” And reflects current compliance as discussed below.

#### **4.3.3 NRC Acceptance**

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c), dated March 10, 2015 (Section 3.2.6):

*'The NRC staff reviewed the licensee's LAR, as supplemented, for conformity with the requirements contained in NFPA 805, Section 2.4.2, regarding the process used to perform the NSCA. The NRC staff concluded that the declared safe and stable condition proposed was acceptable because the licensee's analysis process adequately and appropriately identified and located the systems, equipment, and cables, required to provide reasonable assurance of achieving and maintaining the fuel in a safe and stable condition, as well as to meet the NFPA 805 NSPC.'*

*In accordance with 10 CFR 50.48(c)(2)(iii), the NRC staff confirmed, through review of the documentation provided in the LAR, that feed and bleed was not the sole fire-protected SSD path for maintaining reactor coolant inventory, pressure control, and decay heat removal capability.*

*The NRC staff also reviewed the licensee's process to identify and analyze MSOs. Based on the LAR, as supplemented, the process used to identify and analyze MSOs is considered comprehensive and thorough. Through the use of an expert panel process, in accordance with the guidance of RG 1.205, NEI 04-02, and FAQ 07-0038, potential MSO combinations were identified and included as necessary in the NSCA, as well as the applicable FREs. The NRC staff also considers the approach the licensee uses for assessing the potential for MSO combinations acceptable, because it was performed in accordance with NRC endorsed guidance.'*

#### 4.3.4 Ongoing Compliance Maintenance

Table 4-1 above lists the documented calculations completed to verify achievement of the NSPC for each fire area at Farley Nuclear Plant. The current information is housed in the active calculations from the Table and the calculation information in the ARCPlus™ database. Appendix F provides an informational use summary of the results of this review and summarizes how the NSPC is met for each analyzed fire area.

Table 4-2 below summarizes how the NSPC is met for each analyzed fire area with respect to general Safe Shutdown (SSD) path credited and whether the area complies deterministically or requires application of risk-informed, performance-based methods to demonstrate compliance.

### 4.3.5 Recovery Actions

#### 4.3.5.1 Compliance Requirements

NFPA 805, Section 1.6.52, "Recovery Action," defines a recovery action as:

*"Activities to achieve the nuclear safety performance criteria that take place outside the main control room or outside the primary control station(s) for the equipment being operated, including the replacement or modification of components."*

NFPA 805, Section 4.2.3.1, states that:

*"One success path of required cables and equipment to achieve and maintain the nuclear safety performance criteria without the use of recovery actions shall be protected by the requirements specified in either 4.2.3.2, 4.2.3.3, or 4.2.3.4, as applicable. Use of recovery actions to demonstrate availability of a success path for the nuclear safety performance criteria automatically shall imply use of the performance-based approach as outlined in 4.2.4."*

NFPA 805 Section 4.2.4, "Performance-Based Approach," states that:

*"When the use of recovery actions has resulted in the use of this approach, the additional risk presented by their use shall be evaluated."*

#### 4.3.5.2 FNP Results

Guidance provided in NEI 04-02, FAQ 07-0030, FAQ 12-0061, and RG 1.205 established the methodology used to determine RAs required for compliance and consisted of the following steps:

**Step 1:**

For FNP Unit 1, in addition to the Main Control Room, the Hot Shutdown Panels (HSPs) are defined as Primary Control Stations and include HSP A, B, D, E, and G located in Fire Area 1-012, Room 254, and HSP C and F located in Fire Area 1-015, Room 202.

For FNP Unit 2, in addition to the Main Control Room, the HSPs are defined as Primary Control Stations and include HSP A, B, D, E and G located in Fire Area 2-015, Room 2202, and the HSP C and F located in Fire Area 2-012, Room 2254.

Operator actions taken outside the Main Control Room or Primary Control Stations that are necessary to activate, turn on, power up, transfer control or indication, or otherwise enable the Primary Control Stations and make it capable of performing its intended function following a fire may be considered as taking place at the Primary Control Stations as long as the actions are feasible and take place in time to allow the Primary Control Stations to perform their intended functions. The switches or other equipment operated to transfer control must be free from fire damage and operators can travel from the Main Control Room to the transfer location and on to the Primary Control Station without being impeded by the fire.

**Step 2:**

On a fire area basis, VFDRs were originally identified in LAR Attachment C, Table B-3. For each VFDR not brought into compliance with the deterministic approach, an evaluation was conducted using the performance-based approach of NFPA 805 Section 4.2.4. Some performance-based evaluations resulted in the need for Recovery Actions to meet the risk acceptance criteria or to maintain a sufficient level of DID. The final set of required Recovery Actions was provided in the LAR Attachment G, Table G-1, "Recovery Actions and Activities Occurring at the Primary Control Station(s)."

**Step 3:**

The set of Recovery Actions necessary to demonstrate the availability of a success path for the NSPC was originally evaluated for additional risk using the process described in NEI 04-02, FAQ 07-0030, and RG 1.205. Any additional risk was evaluated with the guidelines of RG 1.174 and RG 1.205. The additional risk was originally provided in LAR Attachment W. If Recovery Actions were determined to have an adverse risk impact, they were resolved via alternate strategies that eliminated the need for the RA in the NSCA; therefore, none of the Recovery Actions have an adverse impact on the FPRA.

**Step 4:**

All Recovery Actions were originally evaluated (and documented in LAR Attachment G) against the feasibility criteria provided in NEI 04-02, FAQ 07-0030, and RG 1.205. Since actions taken at the Primary Control Stations are not Recovery Actions, their feasibility is evaluated in accordance with procedures for validation of off-normal procedures.

**Step 5:**

The reliability of the specific Recovery Actions added to the Fire PRA was addressed in the Fire PRA Human Failure Evaluation Report F-RIE-FIREPRA-U00-012 in support of the LAR submittal, which has been accepted by the NRC.

#### 4.3.5.3 NRC Acceptance

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c), dated March 10, 2015 (Section 3.2.6):

*'The NRC staff concluded that, based on the information provided in the LAR, as supplemented, and the information obtained during the NFPA 805 site audit (documents reviewed and discussions with the licensee's staff) that the process used by the licensee to review, categorize and address RAs during the transition from the existing deterministic fire protection licensing basis to a RI/PB FPP is consistent with the NRC-endorsed guidance contained in NEI 04-02 and RG 1.205 regarding the identification of RAs. Provided the licensee completes implementation items 25 and 26 as described in LAR Attachment S, Table S-3, the NRC staff concluded that there is reasonable assurance that the regulatory requirements of 10 CFR 50.48(c) and NFPA 805 for NSCA methods are met.'*

#### 4.3.5.4 Ongoing Compliance Maintenance

Appendix E Tables E-1 and E-2 document the Recovery Actions that support requirements for those fire areas evaluated under the risk-informed, performance-based approach for each unit.

Table E-1 documents all Risk Informed Performance Based Recovery Actions for Unit 1.

Table E-2 documents all Risk Informed Performance Based Recovery Actions for Unit 2.

Table E-3 documents all Control Room Abandonment Actions Taken at the Primary Control Station(s).

Per FAQ 12-0061, any changes to recovery actions since NFPA 805 implementation are evaluated using the same criteria as before. The current revision of SNC Calculation SE-C051326701-011 documents the feasibility of the recovery actions. The reliability of the specific Recovery Actions added to the Fire PRA is addressed in the Fire PRA Human Failure Evaluation Report Calculation F-RIE-FIREPRA-U00-012.

### 4.3.6 Non-Power Operations

#### 4.3.6.1 Compliance Requirements

NFPA 805, Section 1.1, "Scope", states that:

*'This standard specifies the minimum fire protection requirements for existing light water nuclear power plants during all phases of plant operation, including shutdown, degraded conditions, and decommissioning.'*

NFPA 805, Section 1.3.1, "Nuclear Safety Goal", states that:

*'The nuclear safety goal is to provide reasonable assurance that a fire during any operational mode and plant configuration will not prevent the plant from achieving and maintaining the fuel in a safe and stable condition.'*

#### 4.3.6.2 FNP Results

The strategy for controls/protection of equipment during Non-Power Operational (NPO) modes is a combination of normal defense-in-depth actions and additional risk-informed steps/actions when needed. The latter is based on the availability of systems and equipment needed to support Key Safety Functions (KSFs) and whether or not the plant is in a Higher Risk Evolution (HRE). The goal is to ensure that contingency plans are established for planned and forced shut downs when the plant is in an HRE, and there is the possibility of losing a KSF due to fire.

The methodology used to determine NPO strategies is outlined in NEI 04-02 and FAQ 07-0040 and consists of the following:

- a) Determine the Plant Operating States of interest.
- b) Determine the Key Safety Functions (KSFs).
- c) Identify plant equipment supporting KSF success paths.
- d) Identify KSF Pinch Points.
- e) Incorporate steps to manage risk associated with fire induced vulnerabilities during outage high risk evolutions.

The NPO analysis methodology and results are contained in calculation SE-C051326701-005, NFPA 805 Non-Power Operation Review. Higher Risk Evolutions, Fire Risk Management Actions and Pinch Point were defined and requirements established in NMP-OM-002, Shutdown Risk Management. FNP-0-UOP-4.0, General Outage Operations Guidance provided a detailed Pinch Point Contingency Plan for use during established HREs. Additionally, risk-informed compensatory actions are designated for Pinch Point protection based on various risk-related factors.

#### **4.3.6.3 NRC Acceptance**

The NRC staff reviewed LAR Section 4.3, "Non-Power Operational Modes" and LAR Attachment D, "NEI 04-02 Table F-1 Non-Power Operational Modes Transition," to evaluate the licensee's treatment of potential fire impacts during NPOs. The NRC staff concluded that the licensee used the process described in NEI 04-02, as modified by FAQ 07-0040, for demonstrating that the NSPC are met for HREs during NPO modes. This was accepted by the NRC in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c) dated March 10, 2015 (Section 3.5.3.1).

#### **4.3.6.4 Ongoing Compliance Maintenance**

The NPO analysis methodology and results are still contained in calculation SE-C051326701-005, NFPA 805 Non-Power Operation Review, which references the latest version of FAQ 07-0040. Higher Risk Evolutions, Fire Risk Management Actions and Pinch Point are defined and requirements established in NMP-OM-002, Shutdown Risk Management. FNP-0-UOP-4.0, General Outage Operations Guidance provides a detailed Pinch Point Contingency Plan for use during established HREs. Additionally, risk-informed compensatory actions are designated for Pinch Point protection based on various risk-related factors.

### **4.4 Fire Probabilistic Risk Assessment**

#### **4.4.1 Compliance Requirements**

NFPA 805, Section 2.4.3, "Fire Risk Evaluations" states that:

*"The PSA methods, tools, and data used to provide risk information for the performance-based evaluation of fire protection features (see 4.2.4.2) or provide risk information to the change analysis described in 2.4.4 shall conform with the requirements in 2.4.3.1 through 2.4.3.3."*

NFPA 805, Section 2.4.4, "Plant Change Evaluation" states that:

*“A plant change evaluation shall be performed to ensure that a change to a previously approved fire protection program element is acceptable. The evaluation process shall consist of an integrated assessment of the acceptability of risk, defense-in-depth, and safety margins.”*

NFPA 805, Section 2.4.3.1 states that:

*“The PSA evaluation shall use core damage frequency (CDF) and large early release frequency (LERF) as measures for risk.”*

NFPA 805, Section 2.4.3.2 states that:

*“The PSA evaluation shall address the risk contribution associated with all potentially risk-significant fire scenarios.”*

NFPA 805, Section 2.4.3.3 states that:

*“The PSA approach, methods, and data shall be acceptable to the AHJ. They shall be appropriate for the nature and scope of the change being evaluated, be based on the as-built and as-operated and maintained plant, and reflect the operating experience at the plant.”*

NFPA 805, Section 4.2.4.2 “Use of Fire Risk Evaluations”, states that:

*“Use of fire risk evaluation for the performance-based approach shall consist of an integrated assessment of the acceptability of risk, defense-indepth, and safety margins.”*

#### 4.4.2 FNP Results

The internal events PRA was modified to capture the effects of fire both as an initiator of an event and as a potential failure mode of affected circuits and individual targets. The Fire PRA for the initial License Amendment was developed using the guidance for Fire PRA development in NUREG/CR- 6850, and FAQs. The following calculations documented the Fire PRA results for the LAR and subsequent RAI responses

**Table 4-3 LAR Fire PRA Calculations**

Calculation No.	Title
PRA-BC-F-11-002	Component Selection
PRA-BC-F-11-003	PRA-BC-F-11-003
PRA-BC-F-11-004	FPRA Logic Model
PRA-BC-F-11-006	Seismic Fire Interaction
PRA-BC-F-11-009	Plant Partitioning and Fire Ignition Frequency
PRA-BC-F-11-013	Circuit Failure Mode and Likelihood Analysis
PRA-BC-F-11-014	Fire Scenario Development
PRA-BC-F-11-015	Hot Gas layer and Multi-compartment Analysis
PRA-BC-F-11-016	Human Reliability Analysis for Fire Events
PRA-BC-F-11-017	Farley Fire PRA Summary Report

Fire modeling was performed as part of the original Fire PRA development (NFPA 805 Section 4.2.4.2) utilizing fire model guidance in RG 1.205, Regulatory Position 4.2 and Section 5.1.2 of NEI 04-02.

The FNP Fire PRA peer review was conducted by the Westinghouse Owners Group in October 2011 under LTR-RAM-II-12-007, “Fire PRA Peer Review Against the Fire PRA Standard

Supporting Requirements from Section 4 of the ASME/ANS PRA Standard for the Farley Nuclear Plant Fire Probabilistic Risk Assessment” in accordance with NEI 07-12 as endorsed by RG 1.200 Rev 2. The conclusion of the review was that the FNP methodologies used were appropriate and sufficient to satisfy the ASME/ANS PRA Standard RA-Sa-2009. The review team also noted that NUREG/CR-6850 methodologies were applied correctly and concluded that the FNP Fire PRA was consistent with the ASME/ANS PRA Standard and supports risk-informed applications.

The technical adequacy of the portions of the Internal Events PRA (IEPRA) model used to support development of the Fire PRA model was reviewed using the American Society of Mechanical Engineers/American Nuclear Society (ASME/ANS) RA-Sa-2009, "Standard for Level 1/LERF PRA for Nuclear Power Plant Applications" (ASME/ANS PRA Standard).<sup>2</sup> The review was conducted by a team of knowledgeable industry (vendor and utility) personnel of the Farley Nuclear Plant (FNP) Internal Events PRA utilizing the RG 1.200, Revision 2, Peer Review against the ASME PRA standard requirements. In the course of this review, seventy-eight new Facts and Observations (F&Os) were prepared, including three "Best Practices", thirty-five "Suggestions" and forty "Findings". These have been reviewed and their resolution found acceptable by the NRC.

#### 4.4.3 NRC Acceptance

The risk change due to the NFPA 805 transition met the acceptance guidelines of RG 1.205. In accordance with that guidance, the results of the FREs for each Fire Area were combined (including the assessment of additional risk of recovery actions) for FNP. The total risk increase (when considering total plant risk) was then compared to the acceptance criteria of RG 1.174 (increases are below 1.0E-05 and 1.0E-06 for CDF and LERF, respectively.)

From Table W-6 of the LAR, the delta CDF/LERF was as follows:

- • <0/rx-yr | <0/rx-yr, respectively for Unit 1
- • <0/rx-yr | <0/rx-yr, respectively for Unit 2

The '<0' is based on the non-VFDR risk reduction modifications as described at the bottom of LAR Table W-6.

Table W-6, FNP Fire Area Risk Summary of Attachment W – Fire PRA Insights to the LAR dated September 25, 2012 was revised in response to RAI 36 and submitted on August 29, 2014. This revised Table W-6 summarizes the individual fire area contributions to risk worth at time of NFPA 805 transition. These risk numbers are living data subject to new risk insights or plant changes identified in the NFPA 805 Monitoring Program. The risk values used to support the NFPA 805 Safety evaluation were:

**Table 4-4 NFPA 805 Safety Evaluation Total Plant Risk**

	Unit 1 CDF	Unit 2 CDF	Unit 1 LERF	Unit 2 LERF
Total Plant Risk	9.40E-5	9.86E-5	5.16E-6	7.49E-6

Consistent with the Full Power Internal Events model, the CDF/LERF is calculated on a train basis and then averaged together to obtain the total plant CDF/LERF and delta CDF/LERF.

<sup>2</sup> Internal Events initially only included events such reactor trip, loss of coolant, loss of power and SGTR as examples. In recent years, internal events have expanded to include internal fire and flooding events.

The total risk for CDF and LERF met the RG 1.174 criteria being below 1E-04/yr. for CDF and 1E-05/yr. for LERF.

#### 4.4.4 Ongoing Compliance Maintenance

The Fire PRA update in 2017 resulted in the use of 4 new methods that required a focused scope peer review. These were: 1) treatment of junction box fires, 2) treatment of tray fires, 3) incorporation of NUREG/CR-7150, and 4) incorporation of NUREG-2180. A focused scope peer review was held to review these methods and the conclusion of the review was that the FNP methodologies used were appropriate and sufficient to satisfy the ASME/ANS PRA Standard RA-Sa-2009 for the Fire PRA for FNP Units 1 and 2. The two key results from the assessment are the determination of the total plant risk and the total net change in risk (increase) associated with the transition to NFPA 805. In addition to the previous methodology, the 2017 update of the Fire PRA utilized data from NUREG 2180 and additional industry guidance to update or create the following model development documents:

Table 4-5: Fire PRA Calculations	
Calculation No.	Title
F-RIE-FIREPRA-U00-001	Plant Partitioning and Fire Ignition Frequency for Farley Fire PRA
F-RIE-FIREPRA-U00-002	Equipment Selection for Farley Fire PRA
F-RIE-FIREPRA-U00-003	Farley Fire PRA Cable Selection and Detailed Circuit Failure Analysis
F-RIE-FIREPRA-U00-005	Fire PRA Logic Model for Farley Nuclear Plants
F-RIE-FIREPRA-U00-008A	Fire Probabilistic Risk Assessment Fire Scenario Report
F-RIE-FIREPRA-U00-008B	Evaluation of the Control Room Abandonment Times at Farley Nuclear Plant
F-RIE-FIREPRA-U00-008C	Hot Gas Layer and Multi-Compartment Analysis
F-RIE-FIREPRA-U00-008D	Fire Modeling Treatments
F-RIE-FIREPRA-U00-010	Farley Fire PRA Circuit Failure Mode Likelihood Analysis
F-RIE-FIREPRA-U00-012	Human Reliability Analysis for Fire Events
F-RIE-FIREPRA-U00-013	Seismic Fire Interaction
F-RIE-FIREPRA-U00-014	Fire Probabilistic Risk Assessment Summary Report
SNC Record # 05058-RPT-027	NFPA 805 Transition Risk Results for Farley

Given the scope and extent of data, model, and Fire PRA treatment changes (e.g., NUREG-2169, NUREG-2178, NUREG-2180, etc.) together with internal events PRA model changes related to RCP seal performance (including asymmetric cooling), and the fact that these models have all been updated, a formal update of the total plant risk using the latest FNP PRA models was conducted. The total plant risk was updated as part of the analyses to support transition to NFPA 805. These updated values must be combined with the latest updated risk metrics for the other hazard categories to produce an updated total plant risk estimate.

The total plant risk is obtained by summing the CDF and LERF results from the various PRA models. Each of these models have their own suite of reports and analysis documents. The

applicable CDF and LERF metrics are extracted from those documents and have been summarized in the tables below.

Table 4-6 Unit 1 Total Plant Risk

Hazard Type	Unit 1 CDF		Unit 1 LERF	
	Train A Alignment	Train B Alignment	Train A Alignment	Train B Alignment
Internal Events (incl flooding)	8.93E-6	8.86E-6	1.68E-7	1.83E-7
Fire	8.24E-5	8.46E-5	4.04E-6	4.37E-6
Seismic	4.51E-6	4.51E-6	2.07E-6	2.07E-6
Other External Events	NA	NA	NA	NA
Total	9.58E-5	9.80E-5	6.28E-6	6.62E-6
AVERAGE		9.69E-5		6.45E-6

Table 4-7 Unit 2 Total Plant Risk

Hazard Type	Unit 2 CDF		Unit 2 LERF	
	Train A Alignment	Train B Alignment	Train A Alignment	Train B Alignment
Internal Events (incl flooding)	8.75E-6	8.76E-6	1.70E-7	1.60E-7
Fire	7.81E-5	7.97E-5	4.08E-6	4.94E-6
Seismic	4.51E-6	4.51E-6	2.07E-6	2.07E-6
Other External Events	NA	NA	NA	NA
Total	9.14E-5	9.30E-5	6.32E-6	7.17E-6
AVERAGE		9.22E-5		6.75E-6

The results shown above are below the acceptance criteria for total plant risk of 1E-4 and 1E-5 for CDF and LERF, respectively. The Unit 2 CDF and LERF results are lower than the totals previously provided to the NRC. However, the Unit 1 CDF and LERF values are slightly higher but still within acceptable limits as defined in RG 1.174 and the NRC SE for NFPA 805.

The change in risk is an evaluation of the transition risk relative to a fully compliant plant. The fully compliant plant configuration represents a fully compliant plant with all VFDR conditions eliminated and credit taken for both VFDR related and risk reduction modifications. The analysis process involves obtaining the risk metrics from the base Fire PRA model and subtracting the risk associated with a hypothetical plant configuration that is fully compliant.

The extent of changes (data, model, modifications, etc.) could not be isolated to specific aspects of the analysis and fire scenarios, such that a parametric or sensitivity approach could be used to address the specific scenarios that are determined to be impacted. However, the changes that impacted the FNP Fire PRA were extensive and impact a very large number of fire scenarios. The impacts are varied in that some changes would tend to increase the risk results while others would tend to reduce the risk results. Because of the extensive changes, an approach that attempts to focus the analysis on only the impacted scenarios is not viable. The situation with the FNP Fire PRA is such that numerous changes that impact the Fire PRA have occurred. The underlying data for the Fire PRA, as well as the VFDR scope, have changed. The analytical treatment of various aspects of the Fire PRA such as credit for incipient smoke

detectors, electrical cabinets heat release rates, fire ignition frequency, and RCP seal performance modeling, have all changed. As such, it is not possible to isolate a limited number of impacted fire scenarios. Instead, a comprehensive assessment of the change in risk that occurs in each of the FNP Fire Areas was necessary and was performed for FNP. The results are described in SNC Record # 05058-RPT-027 and summarized in the table below:

Table 4-8 Change In Risk		
Unit/End State	Change in Risk	Acceptance Criteria
Unit 1 CDF	< 0	< 1E-05
Unit 1 LERF	<0	< 1E-06
Unit 2 CDF	9.75E-06	< 1E-05
Unit 2 LERF	< 0	<1E-06

The delta risk for CDF and LERF meet the RG 1.174 criteria for being below 1E-05/yr. for CDF and 1E-06/yr. for LERF.

## 4.5 Fire Modeling

### 4.5.1 Compliance requirements

NFPA 805 allows both Fire Modeling and Fire Risk Evaluations (FRE) as Performance Based (PB) alternatives to the deterministic approach outlined in the standard. These two PB approaches are described in NFPA 805, Sections 4.2.4.1 and 4.2.4.2, respectively. Although fire modeling and FREs are presented as two different approaches for PB compliance, the FRE approach generally involves some degree of fire modeling to support engineering analyses and fire scenario development. NFPA 805, Section 1.6.18, defines a fire model as a *"mathematical prediction of fire growth, environmental conditions, and potential effects on SSCs based on the conservation equations or empirical data."*

### 4.5.2 FNP Results

Farley Nuclear Plant did not utilize fire modeling methods to support PB evaluations in accordance with NFPA 805, Section 4.2.4.1, as the sole means for demonstrating compliance with the NSPC.

### 4.5.3 NRC Acceptance

As stated in the LAR, Section 4.5.2.1, FNP did not use the fire modeling approach for demonstrating compliance with NFPA 805. The licensee used the FRE PB approach (i.e., FPRA) with input from fire modeling analyses. Therefore, the NRC staff reviewed the technical adequacy of the FREs, including the supporting fire modeling analyses, as documented in SE Section 3.4.2, to evaluate compliance with the NSPC.

### 4.5.4 Ongoing Compliance Maintenance

Not Applicable - Fire Modeling approach not used at Farley.

## 4.6 Radioactive Release

### 4.6.1 Compliance Requirements

NFPA 805 Chapter 1 defines the radioactive release goals, objectives, and performance criteria that must be met by the FPP in the event of a fire at a nuclear power plant in any plant operational mode as follows:

- NFPA 805, Section 1.3.2, Radioactive Release Goal states:  
*The radioactive release goal is to provide reasonable assurance that a fire will not result in a radiological release that adversely affects the public, plant personnel, or the environment.*
- NFPA 805, Section 1.4.2, Radioactive Release Objective states:  
*Either of the following objectives shall be met during all operational modes and plant configurations.*  
*(1) Containment integrity is capable of being maintained.*  
*(2) The source term is capable of being limited.*
- NFPA 805, Section 1.5.2, Radioactive Release Performance Criteria states:  
*Radiation release to any unrestricted area due to the direct effects of fire suppression activities (but not involving fuel damage) shall be as low as reasonably achievable and shall not exceed applicable 10 CFR Part 20 limits.*

### 4.6.2 FNP Results

The pre-transition Fire Protection Program was reviewed against the NFPA 805 requirements for fire suppression related radioactive release. The review was performed using the methodology contained in SM-C051326701-010, NFPA 805 Radiological Release Calculation which used the guidance from NEI 04-02, Revision 2 (Sections 4.3 and Appendix G), as endorsed by RG 1.205. This review also utilized the guidance of FAQ 09-0056, Radioactive Release Transition. The methodology consisted of:

- Identifying those Fire Areas where radioactive materials were present and where there was a potential for generating radioactive effluents during fire suppression activities.
- Reviewing fire pre-plans and fire brigade training materials and identifying FPP elements (e.g., systems, components, procedural actions) that were being credited to meet the radioactive release goals, objectives and performance criteria.
- Reviewing engineering controls to ensure containment of gaseous and liquid effluents (e.g., smoke and fire fighting agents).

The following reviews were conducted:

- An Airborne Effluent Evaluation demonstrated that existing Auxiliary Building ventilation systems and boundaries are effective in meeting the NFPA 805 goal.
- A Liquid Effluent Evaluation demonstrated that existing Auxiliary Building floor drains and liquid waste collection systems are effective in meeting the NFPA 805 goal.
- An Administrative Controls Evaluation resulted in several required enhancements as follows:
  - (1) Clearer guidance in related procedures for potential fire-related radioactive release, including update of the Pre-fire Plans to show areas of potential release.

- (2) Revised Fire Brigade training on the new objectives to control radiological releases during fire.
- (3) Administrative controls to keep radioactive contamination within secure metal containers for RCA(s) outside of hardened structures (e.g., Auxiliary Building) when contamination levels are high enough to warrant.

These reviews and actions provided reasonable assurance that radiation levels to any unrestricted area resulting from the direct effects of fire suppression activities are as low as reasonably achievable and are not likely to exceed the radiological release performance criteria of NFPA 805 and the radiological dose limits in 10 CFR Part 20.

#### 4.6.3 NRC Acceptance

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c) dated March 10, 2015 (Section 3.6.8):

*“Based on these factors, the NRC staff concludes that, subject to completion of the implementation items, the licensee’s RI/PB FPP provides reasonable assurance that radiation releases to any unrestricted area resulting from the direct effects of fire suppression activities are as low as reasonably achievable and are not likely to exceed the radiological release performance criteria of NFPA 805 and the radiological dose limits in 10 CFR Part 20. The NRC staff therefore concludes that the licensee’s approach is acceptable and that the FPP will comply with the requirements specified in NFPA 805, Sections 1.3.2, 1.4.2, and 1.5.2.”*

#### 4.6.4 Ongoing Compliance Maintenance

The review continues to be performed using the methodology contained in SM-C051326701-010, NFPA 805 Radiological Release Calculation which used the guidance from NEI 04-02, Revision 2 (Sections 4.3 and Appendix G), as endorsed by RG 1.205. This review also utilizes the guidance of FAQ 09-0056, Radioactive Release Transition. See SM-C051326701-010, NFPA 805 Radiological Release Calculation for a summary of the Radioactive Release results.

### 4.7 Fire Response

#### 4.7.1 Compliance Requirements

NFPA 805, Section 3.4.1, “On-Site Fire Fighting Capability” states that:

*“All of the following requirements shall apply. Emergency response procedures for the plant industrial fire brigade.*

*(a) A fully staffed, trained, and equipped fire-fighting force shall be available at all times to control and extinguish all fires on site. This force shall have a minimum complement of five persons on duty and shall conform with the following NFPA standards as applicable:*

- (1) NFPA 600, Standard on Industrial Fire Brigades (interior structural fire fighting)*
- (2) NFPA 1500, Standard on Fire Department Occupational Safety and Health Program*
- (3) NFPA 1582, Standard on Medical Requirements for Fire Fighters and Information for Fire Department Physicians*

*(b)\*Industrial fire brigade members shall have no other assigned normal plant duties that would prevent immediate response to a fire or other emergency as required.*

*(c) During every shift, the brigade leader and at least two brigade members shall have sufficient training and knowledge of nuclear safety systems to understand the effects of fire and fire*

*suppressants on nuclear safety performance criteria. Exception to (c): Sufficient training and knowledge shall be permitted to be provided by an operations advisor dedicated to industrial fire brigade support.*

*(d)\*The industrial fire brigade shall be notified immediately upon verification of a fire.*

*(e) Each industrial fire brigade member shall pass an annual physical examination to determine that he or she can perform the strenuous activity required during manual firefighting operations. The physical examination shall determine the ability."*

NFPA 805, Section 3.4.2\*, "Pre-Fire Plans" states that:

*"Current and detailed pre-fire plans shall be available to the industrial fire brigade for all areas in which a fire could jeopardize the ability to meet the performance criteria described in Section 1.5.*

*3.4.2.1\* The plans shall detail the fire area configuration and fire hazards to be encountered in the fire area, along with any nuclear safety components and fire protection systems and features that are present.*

*3.4.2.2 Pre-fire plans shall be reviewed and updated as necessary.*

*3.4.2.3\* Pre-fire plans shall be available in the control room and made available to the plant industrial fire brigade.*

*3.4.2.4\* Pre-fire plans shall address coordination with other plant groups during fire emergencies."*

NFPA 805, Section 3.4.3, "Training and Drills" states that:

*"Industrial fire brigade members and other plant personnel who would respond to a fire in conjunction with the brigade shall be provided with training commensurate with their emergency responsibilities.*

*(a) Plant Industrial Fire Brigade Training. All of the following requirements shall apply.*

*(1) Plant industrial fire brigade members shall receive training consistent with the requirements contained in NFPA 600, Standard on Industrial Fire Brigades, or NFPA 1500, Standard on Fire Department Occupational Safety and Health Program, as appropriate.*

*(2) Industrial fire brigade members shall be given quarterly training and practice in fire fighting, including radioactivity and health physics considerations, to ensure that each member is thoroughly familiar with the steps to be taken in the event of a fire.*

*(3) A written program shall detail the industrial fire brigade training program.*

*(4) Written records that include but are not limited to initial industrial fire brigade classroom and hands-on training, refresher training, special training schools attended, drill attendance records, and leadership training for industrial fire brigades shall be maintained for each industrial fire brigade member.*

*(b) Training for Non-Industrial Fire Brigade Personnel. Plant personnel who respond with the industrial fire brigade shall be trained as to their responsibilities, potential hazards to be encountered, and interfacing with the industrial fire brigade.*

*(c)\*Drills. All of the following requirements shall apply.*

*(1) Drills shall be conducted quarterly for each shift to test the response capability of the industrial fire brigade.*

(2) Industrial fire brigade drills shall be developed to test and challenge industrial fire brigade response, including brigade performance as a team, proper use of equipment, effective use of pre-fire plans, and coordination with other groups. These drills shall evaluate the industrial fire brigade's abilities to react, respond, and demonstrate proper fire-fighting techniques to control and extinguish the fire and smoke conditions being simulated by the drill scenario.

(3) Industrial fire brigade drills shall be conducted in various plant areas, especially in those areas identified to be essential to plant operation and to contain significant fire hazards.

(4) Drill records shall be maintained detailing the drill scenario, industrial fire brigade member response, and ability of the industrial fire brigade to perform as a team.

(5) A critique shall be held and documented after each drill."

NFPA 805, Section 3.4.4, "Fire-Fighting Equipment" states that:

*"Protective clothing, respiratory protective equipment, radiation monitoring equipment, personal dosimeters, and fire suppression equipment such as hoses, nozzles, fire extinguishers, and other needed equipment shall be provided for the industrial fire brigade. This equipment shall conform with the applicable NFPA standards."*

NFPA 805, Section 3.4.5, "Off-Site Fire Department Interface" states that:

*"3.4.5.1 Mutual Aid Agreement. Off-site fire authorities shall be offered a plan for their interface during fires and related emergencies on site."*

*3.4.5.2\* Site-Specific Training. Fire fighters from the off-site fire authorities who are expected to respond to a fire at the plant shall be offered site-specific training and shall be invited to participate in a drill at least annually."*

*3.4.5.3\* Security and Radiation Protection. Plant security and radiation protection plans shall address off-site fire authority response."*

*3.4.6\* Communications. An effective emergency communications capability shall be provided for the industrial fire brigade."*

## **4.7.2 FNP Results**

### **4.7.2.1 Operations Response**

Operations response to fire in the power block is controlled through:

- FNP-0-AOP-29.0, Abnormal Operating Procedure: Plant Fire
- FNP-1/2-AOP-28.2, Abnormal Operating Procedure: Fire in the Control Room
- FNP-1/2-AOP-28.1, Abnormal Operating Procedure: Fire or Inadvertent Fire Protection System Actuation in the Cable Spreading Room

Emergency Planning procedure FNP-0-EIP-13.0, Fire Emergencies provides site-level command guidance to support fire response, including obtaining external assistance.

### **4.7.2.2 Fire Brigade Response**

NMP-ES-035-010, Fire Brigade, established the required elements that constitute an effective fire brigade response capability at Farley Nuclear Plant as required by 10 CFR 50.48 – Fire Protection.

FNP-0-FPP-1.0 and applicable SOPs would be utilized to direct firefighting efforts.

The Fire Brigade was trained and monitored for capability and readiness via:

- NMP-TR-425, Fire Drill Program
- NMP-TR-426, Fire Training Program
- MS-MED-009, Fire Brigade Physical Examination Procedure

Pre-Fire Plans (PFPs) for each Fire Area were created to provide:

- Those areas with higher risk significance.
- Fire hazards within the area
- Available fire suppression features
- Available ventilation features
- Radioactive release guidance
- Drawings that readily display critical information for Fire Brigade effectiveness.

PFPs are contained in document books FNP-1/2-FPP-1.0/2.0/3.0 and FNP-0-FPP-1.0/2.0/3.0/4.0

#### 4.7.3 NRC Acceptance

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c) dated March 10, 2015 (Section 3.1.1.1):

*“The NRC staff concludes that the licensee’s statements of compliance are acceptable because the associated actions as described in LAR Attachment A and listed in LAR Attachment S, for the individual attributes described above, as well as the statements that these items will be completed prior to implementation, are acceptable because completion of the implementation items will bring these attributes into compliance with the requirements of NFPA 805 and would be required by the proposed license condition.”*

#### 4.7.4 Ongoing Compliance Maintenance

The procedures and processes referenced in Section 4.7.2 continue to implement this requirement of the program.

## 5.0 PROGRAM DOCUMENTATION, CONFIGURATION CONTROL, AND QUALITY

### 5.1 Program Documentation

#### 5.1.1 Compliance Requirements

NFPA 805, Section 2.7.1.1 states:

*“The analyses performed to demonstrate compliance with this standard shall be documented for each nuclear power plant (NPP). The intent of the documentation is that the assumptions be clearly defined and that the results be easily understood, that results be clearly and consistently described, and that sufficient detail be provided to allow future review of the entire analyses. Documentation shall be maintained for the life of the plant and be organized carefully so that it can be checked for adequacy and accuracy either by an independent reviewer or by the AHJ.”*

NFPA 805, Section 2.7.1.2 states:

*“A fire protection program design basis document shall be established based on those documents, analyses, engineering evaluations, calculations, and so forth that define the fire protection design basis for the plant. As a minimum, this document shall include fire hazards identification and nuclear safety capability assessment, on a fire area basis, for all fire areas that could affect the nuclear safety or radioactive release performance criteria defined in Chapter 1.”*

NFPA 805, Section 2.7.1.3 states:

*“Detailed information used to develop and support the principal document shall be referenced as separate documents if not included in the principal document.”*

#### 5.1.2 FNP Results

The FNP Fire Protection Program design basis is a compilation of multiple analyses, calculations, engineering evaluations, databases and drawings. These design basis documents were performed in accordance with FNP processes that met or exceeded the requirements of documentation outlined above.

Design analysis and calculation procedural guidance for FNP provides methods and requirements to ensure that design inputs and assumptions are clearly defined, that results are easily understood and that sufficient detail is provided to allow for future review of the analysis. The analysis process requires appropriate design and engineering review and approval and the approved analyses are controlled documents maintained for the life of the plant.

#### 5.1.3 NRC Acceptance

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c), dated March 10, 2015 (Section 3.8.1):

*“Based on the LAR description, as supplemented, on the content of the FPP design basis and supporting documentation, and taking into account the licensee’s plans to maintain this documentation throughout the life of the plant, the NRC staff concludes that the licensee’s approach for meeting the requirements of NFPA 805, Sections 2.7.1.1, 2.7.1.2, and 2.7.1.3, regarding adequate development and maintenance of the FPP design basis documentation, is acceptable.”*

#### 5.1.4 Ongoing Compliance Maintenance

The NFPA 805 FPP Design Basis Document (DWG A-181805) summarizes the significant attributes of the program and provides a roadmap for users to efficiently access more detailed information. The information is housed in the current revisions of the referenced calculations and the FSA module of the ArcPlus™ database, which is a controlled QA database and is the source for Appendix F. This document is subject to periodic NRC audit and inspection.

Configuration control of the existing FPP during the transition period was maintained by the FNP change evaluation process, as defined in existing FNP configuration management and configuration control procedures.

Post transition, FNP utilizes a modified and enhanced change evaluation process based on guidance provided in NEI 04-02, Section 5.3 and other regulatory guidance. The enhanced change evaluation process includes a screening function to efficiently eliminate changes that do not impact the Fire Protection Program. Those changes that potentially affect the FPP are further evaluated, including for impacts to the performance-based, risk informed design bases of the FPP.

This change process is controlled in procedure NMP-ES-035-006, Fire Protection Program Impact Screen and Detailed Reviews, and attendant sub-procedures and forms.

### 5.2 Configuration Control

#### 5.2.1 Compliance Requirements

NFPA 805, Section 2.7.2 provides the requirements for configuration control. Section 2.7.2.1, "Design Basis Document", states:

*"The design basis document shall be maintained up-to-date as a controlled document. Changes affecting the design, operation, or maintenance of the plant shall be reviewed to determine if these changes impact the fire protection program documentation."*

NFPA 805, Section 2.7.2.2, "Supporting Documentation", states:

*"Detailed supporting information shall be retrievable records. Records shall be revised as needed to maintain the principal documentation up-to-date."*

#### 5.2.2 FNP Results

FNP has existing configuration control processes and procedures for establishing, revising, or utilizing program documentation. These processes and procedures will be utilized for the new fire protection program documentation. In addition, the NFPA 805 required change evaluation process will be implemented to maintain configuration control of the fire protection program.

#### 5.2.3 NRC Acceptance

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c), dated March 10, 2015 (Section 3.8.2):

*"Based on the LAR description of the FNP configuration control process, which indicates that the new FPP design basis and supporting documentation will be controlled documents and that plant changes will be reviewed for impact on the FPP, the NRC staff concludes that the licensee has a configuration control process that provides reasonable assurance that the requirements of NFPA 805 Sections 2.7.2.1 and 2.7.2.2 are met."*

#### 5.2.4 Ongoing Compliance Maintenance

Overall design control and configuration management of FNP is maintained by SNC fleet procedure NMP-ES-084, Design Control/Configuration Management Processes, and its sub-tier documents. These documents apply to any changes that may impact the fire protection program. In addition, SNC fleet procedure NMP-ES-035-006, Fire Protection Program Impact Screen and Detailed Reviews, will ensure that the fire protection program documentation is maintained up-to-date.

### 5.3 Quality

#### 5.3.1 Compliance Requirements

NFPA 805, Section 2.7.3, “Quality”, provides requirements for review, verification and validation, limitations of use, qualification of users, and uncertainty analysis. The specific requirements are described in NFPA 805 Sections 2.7.3.1 through 2.7.3.5.

#### 5.3.2 FNP Results

The existing Fire Protection QA program was maintained during the NFPA 805 transition. The Fire Protection QA program met and continues to meet the applicable requirements of NFPA 805 Sections 2.7.3.1 through 2.7.3.5.

#### 5.3.3 NRC Acceptance

The NRC acceptance for each of these NFPA 805 sections is summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c), dated March 10, 2015, as noted below.

NRC SE Section 3.8.3.1 states:

*“The NRC staff concludes that the licensee’s approach for meeting the Quality requirements of NFPA 805, Section 2.7.3.1, is acceptable because the licensee provided a description of the process for performing independent reviews of analyses, calculations, and evaluations for review.”*

NRC SE Section 3.8.3.2.4 states:

*“Based on the licensee’s description of the FNP process for V&V of calculational models and numerical methods and its continued use post-transition, the NRC staff concludes that the licensee’s approach to meeting the requirements of NFPA 805 Section 2.7.3.2 is acceptable because the models are consistent with approved uses in NRC guidance or other authoritative publications and because the licensee identified an action [LAR Implementation Item 34] that will result in compliance with NFPA 805 and would be required by the proposed license condition.”*

NRC SE Section 3.8.3.3.4 states:

*“Based on the licensee’s statements that the fire models used to support development of the FREs were used within their limitations, and the description of the FNP process for placing limitations on the use of engineering methods and numerical models, the NRC staff concludes that the licensee’s approach to meeting the requirement of NFPA 805 Section 2.7.3.3 is acceptable because the models are consistent with approved uses in NRC guidance or other authoritative publications and the licensee identified an action [LAR Implementation Item 34] that will result in compliance with NFPA 805 and the action would be required by the proposed license condition.”*

NRC SE Section 3.8.3.4 states the following with respect to NFPA 805 Section 2.7.3.4:

*“The NRC staff concludes that competent and experienced personnel developed the FNP FREs, including the supporting fire modeling calculations and including the additional documentation for models and empirical correlations not identified in previous NRC approved V&V documents.” and*

*“The NRC staff concludes that this action [LAR Implementation Item 29] is acceptable because the action will incorporate the provisions of NFPA 805 [Section 2.7.3.4] in the FPP and because it would be required by the proposed license condition.”*

NRC SE Section 3.8.3.5.4 states:

*“Based on the licensee’s description of the FNP process for performing an uncertainty analysis, the NRC staff concludes that the licensee’s approach for meeting the requirements of NFPA 805 Section 2.7.3.5 is acceptable.”*

### **5.3.4 Ongoing Compliance Maintenance**

NFPA 805, Section 2.7.3.1 requires that each analysis, calculation, or evaluation performed be independently reviewed. Independent reviews of analyses, calculations, and evaluations, including those performed in support of compliance with 10 CFR 50.48(c) were conducted as required by existing FNP procedures. These same requirements continue to apply.

The continued use of existing FNP processes and procedures, as revised in accordance with LAR Implementation Items 29 and 34, will ensure the continued compliance with the NFPA 805 requirements for verification and validation, limitations of use, qualification of users, and uncertainty analysis.

## 6.0 MONITORING

### 6.1 Compliance Requirements

Because an NFPA 805 Fire Protection Program is based on these risk insights from analyses that utilize probability or performance-based inputs, those inputs must be validated on an ongoing basis to ensure that program bases are maintained. NFPA 805 Section 2.6 states that:

*“A monitoring program shall be established to ensure that the availability and reliability of the fire protection systems and features are maintained and to assess the performance of the fire protection program in meeting the performance criteria. Monitoring shall ensure that the assumptions in the engineering analysis remain valid.”*

FAQ 10-0059 assists with clarification of the NFPA 805 requirement.

While traditional fire protection programs have utilized monitoring in the forms of surveillance testing, equipment inspections, system and program health reporting and programmatic audits, an ongoing validation process for performance and risk based inputs to analyses is a new monitoring element required for NFPA 805 licensed plants. [Note: The NFPA 805 Monitoring Program is required by 10 CFR 50.48(c), “Fire Protection” but is not required by 10CFR50.65, “Requirements for Monitoring the Effectiveness of Maintenance at Nuclear Power Plants,” (i.e., Maintenance Rule)].

### 6.2 FNP Results

An NFPA 805 Monitoring Program is established that encompasses all aspects for monitoring the performance of the Fire Protection Program (FPP). And, because this NFPA 805 Monitoring Program requires many of the same performance-based identification, collection and reporting elements that are contained in the Maintenance Rule Program, it is housed in NMP-ES-027-001 and detailed in that procedure

The NFPA 805 Monitoring Program consists of four parts:

1. Identification of the full monitoring scope of SSCs and programmatic elements of the overall FPP. (Calculation SM-C051326701-016, NFPA 805 Monitoring Scoping Evaluation)
2. Risk screening of each unique component, functional group of components or program to determine:
  - Whether qualitative monitoring is required and exists or needs to be established.
  - Whether performance-based monitoring is required and exists or needs to be established based on classification as High Safety Significant (HSS). (Calculation SM-C051326701-017, NFPA 805 Monitoring Screening Evaluation)
3. Identification and validation of acceptance criteria for performance parameters of High Safety Significant (HSS) SSCs of the FPP. (Calculations SM-C051326701-014, NFPA 805 Qualitative Monitoring Evaluation and SM-C051326701-015, NFPA 805 Quantitative Risk Target Evaluation.
4. Ongoing monitoring of the FPP with clearly identified methods, responsibilities and integration with existing monitoring (e.g., Maintenance Rule Program and Health Reporting) and corrective action processes as directed in procedures:
  - NMP-ES-027, Maintenance Rule Program
  - NMP-ES-027-001, Engineering Maintenance Rule Implementation
  - NMP-ES-035-002, Fire Protection Program Notebooks

- NMP-GM-002, Corrective Action Program

### 6.3 NRC Acceptance

As summarized in the Safety Evaluation for Transition to A Risk-Informed, Performance-Based Fire Protection Program in Accordance With 10 CFR 50.48(c) dated March 10, 2015 (Section 3.7.2):

*“The NRC staff reviewed the licensee’s RI/PB FPP and concludes that the licensee’s approach for meeting the requirements of NFPA 805, Sections 2.6, regarding the monitoring program is acceptable and that there is reasonable assurance that the licensee will develop a monitoring program that meets the requirements specified in NFPA 805 Sections 2.6.1, 2.6.2 and 2.6.3, because the licensee identified an action to implement the monitoring program as part of the FPP transition to NFPA 805, and included that action as an implementation item which will incorporate the provisions of NFPA 805 in the FPP and would be required by the proposed license condition.”*

### 6.4 Ongoing Compliance Maintenance

The procedures and processes referenced in Section 6.2 continue to implement this requirement of the program.

## 7.0 FIRE SAFETY ANALYSIS

### 7.1 Compliance Requirements

NFPA 805, section 2.7.1.2, Fire Protection Program Design Basis Document states that a:

*“...fire protection program design basis document shall be established based on those documents, analyses, engineering evaluations, calculations, and so forth that define the fire protection design basis for the plant. As a minimum, this document shall include fire hazards identification and nuclear safety capability assessment, on a fire area basis, for all fire areas that could affect the nuclear safety or radioactive release performance criteria defined in Chapter 1.”*

### 7.2 FNP Results

The Fire Safety Analysis (FSA) (housed in the ArcPlus™ database) includes a summary of the analysis results for each fire area, broken down as follows:

- Systems and Features – This section is broken up by fire zone with a fire area and contains a list of all fire protection systems and features. Each system or feature is followed by report sections for:
  - Requirements, indicating the source of requirements: NFPA 805 Chapter 3 or 4, Risk, or other.
  - Monitoring, indicating the monitoring scoping/screening results.
- Performance Goals – Summary of how the NFPA 805 performance goals are satisfied for the fire area.
- Nuclear Safety Performance Criteria – Summary of impacts on the criteria, typically fire suppression activities effects.
- Previously Approved Engineering Evaluations – Summary of previous exemptions that were rescinded at transition to NFPA 805, where the engineering evaluation underlying the exemption will be used as a qualitative engineering evaluation under NFPA 805.
- Required Systems – Summary by fire zone of the required fire protection systems and features and whether they are required per engineering evaluation, risk or defense in depth.
- Passive Fire Protection Features – Physical construction, ratings, and program requirements of the fire area boundaries, doors, penetration seals, equipment pedestals, curbs/dikes, spray shields, cable coating, electric raceway fire barrier systems, and drainage.

### 7.3 NRC Acceptance

This document, Farley Drawing A-181805, was developed to satisfy the regulations. There was no specific NRC acceptance provided.

### 7.4 Ongoing Compliance Maintenance

The current information is housed in the ArcPlus™ database. Appendix F provides an informational use printout of the results. This is a user defined report and can be customized by Site Fire Protection Personnel.

Appendix D.	FUNDAMENTAL FIRE PROTECTION PROGRAM AND MINIMUM DESIGN ELEMENTS
Appendix E.	RECOVERY ACTIONS BY FIRE AREA
Appendix F.	FIRE SAFETY ANALYSIS
Appendix G.	RADIOACTIVE RELEASE RESULTS

## A. OVERVIEW OF THE REGULATORY REQUIREMENTS – 10 CFR 50.48

On July 16, 2004 the NRC amended 10 CFR 50.48, Fire Protection, to add a new subsection, 10 CFR 50.48(c), which establishes alternative FP requirements. 10 CFR 50.48 endorses, with exceptions, the NFPA's NFPA 805, Performance-Based Standard for Fire Protection for Light Water Reactor Electric Generating Plants – 2001 Edition (NFPA 805), as a voluntary alternative for demonstrating compliance with 10 CFR 50.48 Section (b), Appendix R, and Section (f), Decommissioning.

The voluntary adoption of 10 CFR 50.48(c) by Southern Nuclear Company, Farley Nuclear Plant does not eliminate the need to comply with 10 CFR 50.48(a) and 10 CFR 50, Appendix A, GDC 3, Fire Protection. The NRC addressed the overall adequacy of the regulations during the promulgation of 10 CFR 50.48(c) (Reference FR Notice 69 FR 33536 dated June 16, 2004, ML041340086).

*“NFPA 805 does not supersede the requirements of GDC 3, 10 CFR 50.48(a), or 10 CFR 50.48(f). Those regulatory requirements continue to apply to licensees that adopt NFPA 805. However, under NFPA 805, the means by which GDC 3 or 10 CFR 50.48(a) requirements may be met is different than under 10 CFR 50.48(b). Specifically, whereas GDC 3 refers to SSCs important to safety, NFPA 805 identifies fire protection systems and features required to meet the Chapter 1 performance criteria through the methodology in Chapter 4 of NFPA 805. Also, under NFPA 805, the 10 CFR 50.48(a)(2)(iii) requirement to limit fire damage to SSCs important to safety so that the capability to safely shut down the plant is ensured is satisfied by meeting the performance criteria in Section 1.5.1 of NFPA 805. The Section 1.5.1 criteria include provisions for ensuring that reactivity control, inventory and pressure control, decay heat removal, vital auxiliaries, and process monitoring are achieved and maintained.*

*This methodology specifies a process to identify the fire protection systems and features required to achieve the nuclear safety performance criteria in Section 1.5 of NFPA 805. Once a determination has been made that a fire protection system or feature is required to achieve the performance criteria of Section 1.5, its design must meet any applicable requirements of NFPA 805, Chapter 3. Having identified the required fire protection systems and features, the licensee selects either a deterministic or performance-based approach to demonstrate that the performance criteria are satisfied. This process satisfies the GDC 3 requirement to design and locate SSCs important to safety to minimize the probability and effects of fires and explosions.” (Reference FR Notice 69 FR 33536 dated June 16, 2004, ML041340086)*

The new rule provides actions that may be taken to establish compliance with 10 CFR 50.48(a), which requires each operating nuclear power plant to have a fire protection program plan that satisfies GDC 3, as well as specific requirements in that section. The transition process described in 10 CFR 50.48(c)(3)(ii) provides, in pertinent parts, that a licensee intending to adopt the new rule must, among other things, “modify the fire protection plan required by paragraph (a) of that section to reflect the licensee’s decision to comply with NFPA 805.” Therefore, to the extent that the contents of the existing FP program plan required by 10 CFR 50.48(a) are inconsistent with NFPA 805, the FP program plan must be modified to achieve compliance with the requirements in NFPA 805. All other requirements of 10 CFR 50.48 (a) and GDC 3 have corresponding requirements in NFPA 805. This document represents the revision to the FP program plan to demonstrate compliance with 10 CFR 50.48(a) and (c).

A comparison of the current requirements in Appendix R with the comparable requirements in Section 3 of NFPA 805 shows that the two sets of requirements are consistent in many respects. This was further clarified in FAQ 07-0032, 10 CFR 50.48(a) and GDC 3 clarification (ML081300697). The following tables provide a cross reference of FP regulations associated with the NFPA 805 Farley Nuclear Plant FP program and applicable industry and current Farley Nuclear Plant documents that address the topic.

**10 CFR 50.48(a)****Table A-1 10 CFR 50.48(a) – Applicability/Compliance Reference**

<b>10 CFR 50.48(a) Section(s)</b>	<b>Applicability/Compliance Reference</b>
(1) Each holder of an operating license issued under this part or a combined license issued under part 52 of this chapter must have a fire protection plan that satisfies Criterion 3 of appendix A to this part. This fire protection plan must:	See below
(i) Describe the overall fire protection program for the facility;	NFPA 805 Section 3.2 DWG A-181805
(ii) Identify the various positions within the licensee's organization that are responsible for the program;	NFPA 805 Section 3.2.2 SM-C051326701-003
(iii) State the authorities that are delegated to each of these positions to implement those responsibilities; and	NFPA 805 Section 3.2.2 SM-C051326701-003
(iv) Outline the plans for fire protection, fire detection and suppression capability, and limitation of fire damage.	NFPA 805 Section 2.7 and Chapters 3 and 4 Appendix F
(2) The plan must also describe specific features necessary to implement the program described in paragraph (a)(1) of this section such as:	See below
(i) Administrative controls and personnel requirements for fire prevention and manual fire suppression activities;	NFPA 805 Sections 3.3.1 and 3.4 SM-C051326701-003
(ii) Automatic and manually operated fire detection and suppression systems; and	NFPA 805 Sections 3.5 through 3.10 and Chapter 4 Appendix F
(iii) The means to limit fire damage to structures, systems, or components important to safety so that the capability to shut down the plant safely is ensured.	NFPA 805 Section 3.3 and Chapter 4 Appendix F
(3) The licensee shall retain the fire protection plan and each change to the plan as a record until the Commission terminates the reactor license. The licensee shall retain each superseded revision of the procedures for 3 years from the date it was superseded.	NFPA 805 Section 2.7.1.1 requires that documentation (Analyses, as defined by NFPA 805 2.4, performed to demonstrate compliance with this standard) be maintained for the life of the plant. QATR, Southern Nuclear Operating Company, Inc., Quality Assurance Topical Report.

**Table A-1 10 CFR 50.48(a) – Applicability/Compliance Reference**

<b>10 CFR 50.48(a) Section(s)</b>	<b>Applicability/Compliance Reference</b>
(4) Each applicant for a design approval, design certification, or manufacturing license under part 52 of this chapter must have a description and analysis of the fire protection design features for the standard plant necessary to demonstrate compliance with Criterion 3 of appendix A to this part.	Not applicable. FNP is licensed under 10 CFR 50.

**General Design Criterion 3**

As stated in the UFSAR, the principal design criteria for Farley Nuclear Plant were developed in consideration of seventy GDC for Nuclear Power Plant Construction Permits proposed by the AEC\* in a proposed rule-making published for 10 CFR Part 50 in the Federal Register of July 11, 1967. \*Atomic Energy Commission was predecessor to NRC.

The following is a discussion of Criterion 3, Fire Protection, from the seventy criteria proposed by the AEC, together with SNC's response indicating its interpretation of an agreement with the intent of the criterion as captured in the UFSAR.

**Table A-2 GDC 3 – Applicability/Compliance Reference**

<b>GDC 3, Fire Protection, Statement</b>	<b>Applicability/Compliance Reference</b>
Structures, systems, and components important to safety shall be designed and located to minimize, consistent with other safety requirements, the probability and effect of fires and explosions.	NFPA 805 Chapters 3 and 4 SM-C051326701-003 and Appendix F
Noncombustible and heat resistant materials shall be used wherever practical throughout the unit, particularly in locations such as the containment and control room.	NFPA 805 Sections 3.3.2, 3.3.3, 3.3.4, 3.11.4 SM-C051326701-003
Fire detection and fighting systems of appropriate capacity and capability shall be provided and designed to minimize the adverse effects of fires on structures, systems, and components important to safety.	NFPA 805 Chapters 3 and 4 Appendix F
Firefighting systems shall be designed to assure that their rupture or inadvertent operation does not significantly impair the safety capability of these structures, systems, and components	NFPA 805 Sections 3.4 through 3.10 and 4.2.1 Appendix F

## 10 CFR 50.48(c)

Table A-3 10 CFR 50.48(c) – Applicability/Compliance Reference

10 CFR 50.48(c) Section(s)	Applicability/Compliance Reference
(1) <i>Approval of incorporation by reference.</i> National Fire Protection Association (NFPA) Standard 805, "Performance-Based Standard for Fire Protection for Light Water Reactor Electric Generating Plants, 2001 Edition" (NFPA 805), which is referenced in this section, was approved for incorporation by reference by the Director of the Federal Register pursuant to 5 U.S.C. 552(a) and 1 CFR part 51.	General Information. NFPA 805 (2001 edition) is the edition used.
(2) Exceptions, modifications, and supplementation of NFPA 805. As used in this section, references to NFPA 805 are to the 2001 Edition, with the following exceptions, modifications, and supplementation:	General Information. NFPA 805 (2001 edition) is the edition used.
(i) <i>Life Safety Goal, Objectives, and Criteria.</i> The Life Safety Goal, Objectives, and Criteria of Chapter 1 are not endorsed.	The Life Safety Goal, Objectives, and Criteria of Chapter 1 of NFPA 805 are not part of the FNP Licensing Basis.
(ii) <i>Plant Damage/Business Interruption Goal, Objectives, and Criteria.</i> The Plant Damage/Business Interruption Goal, Objectives, and Criteria of Chapter 1 are not endorsed.	The Plant Damage/Business Interruption Goal, Objectives, and Criteria of Chapter 1 of NFPA 805 are not part of the FNP Licensing Basis.
(iii) <i>Use of feed-and-bleed.</i> In demonstrating compliance with the performance criteria of Sections 1.5.1(b) and (c), a high-pressure charging/injection pump coupled with the pressurizer power-operated relief valves (PORVs) as the sole fire-protected safe shutdown path for maintaining reactor coolant inventory, pressure control, and decay heat removal capability (i.e., feed-and-bleed) for pressurized-water reactors (PWRs) is not permitted.	Feed and bleed is not utilized as the sole fire-protected safe shutdown methodology. SE-C051326701-010.
(iv) Uncertainty analysis. An uncertainty analysis performed in accordance with Section 2.7.3.5 is not required to support deterministic approach calculations.	Uncertainty analysis was not performed for deterministic methodology.
(v) Existing cables. In lieu of installing cables meeting flame propagation tests as required by Section 3.3.5.3, a flame-retardant coating may be applied to the electric cables, or an automatic fixed fire suppression system may be installed to provide an equivalent level of protection. In addition, the italicized exception to Section 3.3.5.3 is not endorsed.	Electrical cable construction complies with a flame propagation test that was found acceptable to the NRC as documented in NFPA 805 SE
(vi) Water supply and distribution. The italicized exception to Section 3.6.4 is not endorsed. Licensees who wish to use the exception to Section 3.6.4 must submit a request for a license amendment in accordance with paragraph (c)(2)(vii) of this section.	Found acceptable to the NRC as documented in NFPA 805 LAR and SE

Table A-3 10 CFR 50.48(c) – Applicability/Compliance Reference

10 CFR 50.48(c) Section(s)	Applicability/Compliance Reference
<p>(vii) Performance-based methods. Notwithstanding the prohibition in Section 3.1 against the use of performance-based methods, the fire protection program elements and minimum design requirements of Chapter 3 may be subject to the performance-based methods permitted elsewhere in the standard. Licensees who wish to use performance-based methods for these fire protection program elements and minimum design requirements shall submit a request in the form of an application for license amendment under § 50.90. The Director of the Office of Nuclear Reactor Regulation, or a designee of the Director, may approve the application if the Director or designee determines that the performance-based approach;</p> <p>(A) Satisfies the performance goals, performance objectives, and performance criteria specified in NFPA 805 related to nuclear safety and radiological release;</p> <p>(B) Maintains safety margins; and</p> <p>(C) Maintains fire protection defense-in-depth (fire prevention, fire detection, fire suppression, mitigation, and post-fire safe shutdown capability).</p>	<p>The use of performance-based methods for NFPA 805 Chapter 3 was requested. See SM-C051326701-003 Found acceptable to the NRC as documented in NFPA 805 SE</p>
(3) <i>Compliance with NFPA 805.</i>	See below
<p>(i) A licensee may maintain a fire protection program that complies with NFPA 805 as an alternative to complying with paragraph (b) of this section for plants licensed to operate before January 1, 1979, or the fire protection license conditions for plants licensed to operate after January 1, 1979. The licensee shall submit a request to comply with NFPA 805 in the form of an application for license amendment under § 50.90. The application must identify any orders and license conditions that must be revised or superseded, and contain any necessary revisions to the plant's technical specifications and the bases thereof. The Director of the Office of Nuclear Reactor Regulation, or a designee of the Director, may approve the application if the Director or designee determines that the licensee has identified orders, license conditions, and the technical specifications that must be revised or superseded, and that any necessary revisions are adequate. Any approval by the Director or the designee must be in the form of a license amendment approving the use of NFPA 805 together with any necessary revisions to the technical specifications.</p>	<p>The LAR was submitted in accordance with 10 CFR 50.90. The LAR included applicable license conditions, orders, technical specifications/bases that needed to be revised and/or superseded.</p>
<p>(ii) The licensee shall complete its implementation of the methodology in Chapter 2 of NFPA 805 (including all required evaluations and analyses) and, upon completion, modify the fire protection plan required by paragraph (a) of this section to reflect the licensee's decision to comply with NFPA 805, before changing its fire protection program or nuclear power plant as permitted by NFPA 805.</p>	<p>The LAR and transition report summarize the evaluations and analyses performed in accordance with Chapter 2 of NFPA 805.</p>
<p>(4) Risk-informed or performance-based alternatives to compliance with NFPA 805. A licensee may submit a request to use risk-informed or performance-based alternatives to compliance with NFPA 805. The request must be in the form of an application for license amendment under § 50.90 of this chapter. The Director of the Office of Nuclear Reactor Regulation, or designee of the Director, may approve the application if the Director or designee determines that the proposed alternatives:</p> <p>(i) Satisfy the performance goals, performance objectives, and performance criteria specified in NFPA 805 related to nuclear safety and radiological release;</p> <p>(ii) Maintain safety margins; and</p> <p>(iii) Maintain fire protection defense-in-depth (fire prevention, fire detection, fire suppression, mitigation, and post-fire safe shutdown capability).</p>	<p>No risk-informed or performance-based alternatives to compliance with NFPA 805 (per 10 CFR 50.48(c)(4)) were utilized.</p>

## B. POWER BLOCK AND FIRE AREA DEFINITION

### B.1. Power Block Scope

The Fire Safe Shutdown definition of 'Power Block' and 'Plant' as referenced in NFPA 805, Chapter 3 was clarified as follows in NEI 04-02: Power Block and Plant refer to structures that have equipment required for nuclear plant operations. The Power Block scope is documented in FNP Calculation SM-C051326701-008. The following areas bound the Farley Nuclear Plant Power Block.

**Table B-1 Power Block - Plant Scope**

<b>Power Block Structures</b>	<b>Fire Area(s)</b>
Turbine Building (U1 & U2)	1-TB, 2-TB
Reactor CNMT (U1 & U2)	1-055, 2-055
Auxiliary Building (U1 & U2)	Various
Diesel Generator Building	Various
Diesel Fuel Oil Storage Tanks	Yard
DFOST Duct Banks	DU-DGFOST-A, DU-DGFOST-B
Fire Pump House and Tanks	Yard
River Water Intake Structure	067, 068, 069, 070
Circulating Water Towers/Pump/Switchgear Houses	Yard
Low Voltage Switchyard	1-080, 2-080
High Voltage Switchyard	Yard
Service Water Intake Structure	072, 073, 074, 075, 076
Water Treatment Building and Demineralized Water Storage Tank & Well Water Storage Tank	Yard
U1 & U2 Condensate Storage Tanks	1-077, 2-077
U1 & U2 Refueling Water Storage Tanks	1-079, 2-079
U1 & U2 Reactor Makeup Water Storage Tanks	1-078, 2-078
Old Steam Generator Storage Building	Yard
Hydrogen and Nitrogen Pad	Yard
Oxygen Tank Pad	Yard
Radwaste Storage Facility	Yard
Solidification/Dewatering Building	Yard

Table B-1 Power Block - Plant Scope	
Power Block Structures	Fire Area(s)

### C. NSCA METHODOLOGY REVIEW

As part of a licensee's application to transition their Fire Protection Program to NFPA 805, they were required to document how their NSCA evaluation was performed in comparison to the NRC endorsed guidance provided in Chapter 3 of NEI 00-01. FNP documented this evaluation in calculation SE-C051326701-006, Table B-2 Nuclear Safety Capability Assessment Methodology Review, and submitted it to the NRC in Attachment B of the NFPA 805 license amendment request dated September 25, 2012. With the reclassification of calculation SE-C051326701-006 as historical, this information has been placed into the ArcPlus™ Fire Safety Analysis (FSA) database.

A copy of the NSCA methodology evaluation was previously provided in this appendix. To avoid duplication of information in two controlled places (i.e., this DBD and the FSA database), this information has been deleted from this appendix. For a copy of the original evaluation, refer to calculation SE-C051326701-006. For a copy of the current evaluation, contact site Fire Protection for a printout from the FSA database.

#### **D. FUNDAMENTAL FIRE PROTECTION PROGRAM AND MINIMUM DESIGN ELEMENTS**

As part of a licensee's application to transition their Fire Protection Program to NFPA 805, they were required to document how their Fire Protection Program met the requirements of NFPA 805 Chapter 3, Fundamental Fire Protection Program and Design Elements. FNP documented this comparison in calculation SM-C051326701-003, NFPA 805 Transition – B-1 Table Calculation, and submitted it to the NRC in Attachment A of the NFPA 805 license amendment request dated September 25, 2012. With the reclassification of calculation SM-C051326701-003 as historical, this information has been placed into the ArcPlus™ Fire Safety Analysis (FSA) database.

A copy of the FPP comparison was previously provided in this appendix. To avoid duplication of information in two controlled places (i.e., this DBD and the FSA database), this information has been deleted from this appendix. For a copy of the original comparison, refer to calculation SM-C051326701-003. For a copy of the current comparison, contact site Fire Protection for a printout from the FSA database.

Revisions to the FNP FPP are controlled under fleet procedure NMP-ES-035-006, Fire Protection Program Impact Screen and Detailed Reviews. See the current revision of FNP FPP drawings, documents, and procedures to see how the NFPA 805 Chapter 3 requirements are being met.

**E. RECOVERY ACTIONS BY FIRE AREA**

Table E-1 documents all Risk Informed Performance Based Recovery Actions for Unit 1.

Table E-2 documents all Risk Informed Performance Based Recovery Actions for Unit 2.

Table E-3 documents all Control Room Abandonment Actions Taken at the Primary Control Station(s).

<b>Table E-1 Unit 1 Recovery Actions</b>			
<b>Fire Area</b>	<b>Equipment ID(s)</b>	<b>Equipment Description(s)</b>	<b>Recovery Action</b>
056A	Q1N11PV3371A	MAIN STEAM ATMOS RELIEF	Operator action to align emergency air system by aligning Emergency Air to Main Steam Atmospheric Relief Valves per FNP-1/2-SOP-62.0 Emergency Air System.
056A	Q1R21E0009F	7.5 KVA INVERTER 1F	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
057	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
060	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
072	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
072	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.

Table E-1 Unit 1 Recovery Actions

Fire Area	Equipment ID(s)	Equipment Description(s)	Recovery Action
075	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
076	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-001	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-001	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-004	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-004	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-012	Q1N11PV3371C	MAIN STEAM ATMOS RELIEF	Operator action to align emergency air system by aligning Emergency Air to Main Steam Atmospheric Relief Valves per FNP-1/2-SOP-62.0 Emergency Air System

Table E-1 Unit 1 Recovery Actions

Fire Area	Equipment ID(s)	Equipment Description(s)	Recovery Action
1-031	Q1N11PV3371A	MAIN STEAM ATMOS RELIEF	Operator action to align emergency air system by aligning Emergency Air to Main Steam Atmospheric Relief Valves per FNP-1/2-SOP-62.0 Emergency Air System.
1-041	Q1N11PV3371A/B/C	MAIN STEAM ATMOS RELIEF	Operator action to align emergency air system by aligning Emergency Air to Main Steam Atmospheric Relief Valves per FNP-1/2-SOP-62.0 Emergency Air System.
1-075	Q1N11PV3371A/B/C	MAIN STEAM ATMOS RELIEF	Operator action to align emergency air system by aligning Emergency Air to Main Steam Atmospheric Relief Valves per FNP-1/2-SOP-62.0 Emergency Air System.
U1 1-075	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-SVB1-B	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-DU-DGSWIS-B	Q1R42B0001B	125V DC Bus 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-SVB1-A	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.

Table E-1 Unit 1 Recovery Actions

Fire Area	Equipment ID(s)	Equipment Description(s)	Recovery Action
1-SVB2-A	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-SVB2-B	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-SVB4-A	Q1R42B0001A	125V DC BUS 1A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-SVB4-B	Q1R42B0001B	125V DC BUS 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
YARD-SWIS	Q1R42B0001B	125V DC Bus 1B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.

Table E-2 Unit 2 Recovery Actions

Fire Area	Equipment ID(s)	Equipment Description(s)	Recovery Action
056A	Q2N11PV3371A	MAIN STEAM ATMOS RELIEF	Operator action to align emergency air system by aligning Emergency Air to Main Steam Atmospheric Relief Valves per FNP-1/2-SOP-62.0 Emergency Air System.
059	Q2R42B0001B	125V DC BUS 2B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
060	Q2R42B0001A	125V DC BUS 2A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
061	Q2N11PV3371A	MAIN STEAM ATMOS RELIEF	Operator action to align emergency air system by aligning Emergency Air to Main Steam Atmospheric Relief Valves per FNP-1/2-SOP-62.0 Emergency Air System.
072	Q2R42B0001A	125V DC BUS 2A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
072	Q2R42B0001B	125V DC BUS 2B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
075	Q2R42B0001B	125V DC BUS 2B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
076	Q2R42B0001A	125V DC BUS 2A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-008	Q2R42B0001A	125V DC BUS 2A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.

Table E-2 Unit 2 Recovery Actions

Fire Area	Equipment ID(s)	Equipment Description(s)	Recovery Action
1-021	Q2R42B0001B	125V DC BUS 2B	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-031	Q2R42B0001A	125V DC BUS 2A	Operator action to provide alternate cooling for battery charger room. WHEN a loss of Service Water and/or HVAC to a Battery Charger Room has occurred THEN provide alternate cooling to any affected Battery Charger Room per FNP-1/2-SOP-58.0, Auxiliary Building HVAC System.
1-042	Q2R42B0001A	125V DC BUS 2A	Operator action to provide alternate cooling for battery charger room. ## F. FIRE SAFETY ANALYSIS

This Appendix is a printout from the ArcPlus™ database FSA module, which is a living, controlled QA database. This Appendix is provided here for information purposes and is the current information as of the date of the printing on the Appendix. Certain printing options have been selected by the site to best represent the required information for users. To obtain the latest current revision of this Appendix reflecting the most current Farley Fire Protection Design and Licensing Basis, contact site Fire Protection. Every effort was made to avoid duplication of information in this Appendix with information contained in controlled calculations and analyses.

The ARCPlus FSA Module has the Fire Zone population as a one to one connection between room number and Fire Zone as described in the Fire PRA Plant partitioning calculation, F-RIE-FIREPRA-U00-001. For example, room 412 was Fire Zone 0412-U1, 0412-U2, 413 was Fire Zone 0413-U1, 0413-U2, etc.

Suppression effects are provided in more detail in calculation SM-C051326701-011, Fire Suppression Effects Analysis. A summary is provided for each fire area in this Appendix.

The Monitoring Program required FP systems and features are listed for each fire area in this Appendix, however a complete description of the Monitoring Program scope, screening, qualitative monitoring and risk target values is described in calculations SM-C051326701-014 through SM-C051326701-017.

Fire hazards for each fire zone are not specifically listed in this appendix. Information regarding fire hazards are found in the following documents.

- F-RIE-FIREPRA-U00-001, Plant Partitioning and Fire Ignition Frequency for Farley Fire PRA (fixed ignition sources)
- FNP-0-FPP-2.0, Protected Area Pre-Fire Plans
- FNP-0-FPP-3.0, Owner Controlled Area Pre-Fire Plan
- FNP-0-FPP-4.0, Radioactive Release Plan
- FNP-1-FPP-1.0, Unit 1 Auxiliary Building Pre-Fire Plan
- FNP-1-FPP-2.0, Unit 1 Turbine Building Pre-Fire Plan
- FNP-1-FPP-3.0, Unit 1 Containment Pre-Fire Plan
- FNP-2-FPP-1.0, Unit 2 Auxiliary Building Pre-Fire Plan
- FNP-2-FPP-2.0, Unit 2 Turbine Building Pre-Fire Plan
- FNP-2-FPP-3.0, Unit 2 Containment Pre-Fire Plan
- A-177678, Combustible Load Calculations for Fire Area Hazards Analysis

## Fire Safety Analysis

Report ID: Report\_0019\_8145  
Product ID: FSA 4.3  
Revision: 043.00.000  
Build Number: 4.3.6492.20066

Data Revision Number: 20120913164234630 (119637)

Engineering Evaluations  
Show Requires NRC Approval Both  
Show Adequate for the Hazard Both  
Show Functionally Equivalent Both  
Show Inactive Both

Licensing Actions  
Show Required Post-Transition Yes  
Show Not Required Post-Transition Yes

Fire areas: All

Show report section(s): Engineering Evaluations, Fire Area Definition, Previously Approved Engineering Evaluations, Performance Goals, Required FP Systems/Features, Suppression Effect,  
Fire Protection System(s): Detection System, ERFBS, Fire Barrier, Fire Damper, FireDoor, Extinguisher, Gaseous Suppression, Hose Station, Hydrant, Passive Feature, Water Suppression,

Required For Compliance Both  
Required For Insurance Both  
Required For Other Both  
Required For Ch3 Both  
In Scope Of Monitoring Both  
High Safety Significance Both

Report requested by: edan-net\thardy  
Requested from workstation: EDAN-TS1

## Fire Safety Analysis

**Fire Area ID:** 044-U1 - Control Room Complex & TSC

**Fire Area Definition**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Fire Zone ID	Description	Elevation(s)
0401-U1	401 Control Room	
0412-U1	412 Kitchen	
0413-U1	413 Kitchen store	
0414-U1	414 Toilet	
0416-U1	416 Unit 1 Instrument Rack Area	
0471-U1	471 Unit 2 Instrument Rack Area	
0472-U1	472 Control Room Supply	
0474-U1	474 Office

## Fire Safety Analysis

**Fire Area ID:** 044-U1 - Control Room Complex & TSC  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	RCS inventory is controlled using Train B charging pump, swing charging pump via Train B power aligned to the RWST.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump, swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using an one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated by the depowered RHR isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump, swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring the Loop 1 and Loop 2 RCPs are shut off and charging is controlled. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using TDAFW pump supplying Steam Generator 1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	Essential processes are monitored by dedicated instruments at the hot shutdown panel.	
7.1 Vital Auxiliaries – Electrical	<ol style="list-style-type: none"> <li>1. Electrical power is supplied by diesel generator EDG-1B.</li> <li>2. 4.16 kV and 600 V power is supplied by Train B distribution equipment.</li> <li>3. 125 VDC power and 120 VAC power is supplied by Train B equipment.</li> </ol>	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	

## Fire Safety Analysis

**Fire Area ID:** 044-U1 - Control Room Complex & TSC

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.4 Vital Auxiliaries – HVAC	Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. The main control room area does not have any automatic suppression. The TSC area adjacent to the main control room has an automatic sprinkler system, but is separated from the main control room by barriers. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	044-U1 - Control Room Complex & TSC	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A	Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. <b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 044-U2 - Control Room Complex & TSC  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump / swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump, swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using an one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated by the depowered RHR isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump, swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring the Loop 1 and Loop 2 RCPs are shut off and charging is controlled. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using TDAFW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	Essential processes are monitored by dedicated instruments at the hot shutdown panel.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond.	

## Fire Safety Analysis

**Fire Area ID:** 044-U2 - Control Room Complex & TSC  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Nuclear Safety Performance Goals

Performance Goal	Method of Accomplishment	Comments
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. The main control room area does not have any automatic suppression. The TSC area adjacent to the main control room has an automatic sprinkler system, but is separated from the main control room by barriers. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 051-U1 - Control Room HVAC Equipment Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A / Train B charging pump, swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using an one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV/block valve and Train B PORV/block valve. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump, or TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by SG pressure Ch 1/CH 2/CH3. 6. SG Level - Steam Generator 1A/1B/1C level is monitored by narrow range Ch 1/CH 2/CH3, wide range.

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B or diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	051-U1 - Control Room HVAC Equipment Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment F Code Compliance Evaluation for NFPA 14, 2007 Edition, Standard for Installation of Standpipes and Hose Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 14, 2007 Edition. The approach was to determine the applicable code edition for the applicable systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Standpipe and hose systems were determined to be compliant with the relevant sections of NFPA 14, 2007 Edition, with the exception of the non-compliances identified in the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1976.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	051-U1 - Control Room HVAC Equipment Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	051-U1 - Control Room HVAC Equipment Rooms	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-6), Unit 1 and 2 Control Room HVAC Equipment Room Auxiliary Building (Fire Area 051), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• A manual action can be performed to install portable ventilation equipment in the affected battery rooms within 20 hours of post-fire hot shutdown initiation to insure that battery room hydrogen concentrations do not exceed acceptable limits.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 051-U2 - Control Room HVAC Equipment Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump aligned to Train A / Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A/Train B charging pump (s) or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves, the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump or TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 051-U2 - Control Room HVAC Equipment Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	051-U2 - Control Room HVAC Equipment Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	051-U2 - Control Room HVAC Equipment Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	051-U2 - Control Room HVAC Equipment Rooms	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-6), Unit 1 and 2 Control Room HVAC Equipment Room Auxiliary Building (Fire Area 051), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• A manual action can be performed to install portable ventilation equipment in the affected battery rooms within 20 hours of post-fire hot shutdown initiation to insure that battery room hydrogen concentrations do not exceed acceptable limits.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 056A-U1 - DG Building Switchgear Room Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump and swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump and swing charging pump aligned to Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using an one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump, swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW supplying Steam Generator 1A. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range CH 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level CH 3. 4. RCS Temperature - RCS Loop 1 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by SG pressure instrumentation in control room. 6. SG Level - Steam Generator 1A/1B/1C level is monitored by SG level instrumentation in control room.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 056A-U1 - DG Building Switchgear Room Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 056A-U1 - DG Building Switchgear Room Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	056A-U1 - DG Building Switchgear Room Train A NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-1), Unit 1 and 2 Diesel Generator Building Train A Switchgear Room (Fire Area 056A), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• A long term manual action to shift service water discharge from the circ water canal to recirculate to the service water pond can be performed by manually repositioning valves QIP16V538 and QIP16V545.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-1), Unit 1 and 2 Diesel Generator Building Train A Switchgear Room (Fire Area 056A), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 056A-U2 - DG Building Switchgear Room Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach, Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 056A-U2 - DG Building Switchgear Room Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	1.Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2.4.16 kV and 600 V power is supplied by Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 056A-U2 - DG Building Switchgear Room Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	056A-U2 - DG Building Switchgear Room Train A NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-1), Unit 1 and 2 Diesel Generator Building Train A Switchgear Room (Fire Area 056A), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• A long term manual action to shift service water discharge from the circ water canal to recirculate to the service water pond can be performed by manually repositioning valves QIP16V538 and QIP16V545.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-1), Unit 1 and 2 Diesel Generator Building Train A Switchgear Room (Fire Area 056A), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 056B-U1 - DG Building Switchgear Room Train B & Foyer  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room or Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Plant shutdown is performed from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump and swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump and swing charging pump aligned to Train A aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using an one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump and swing charging pump aligned to Train A, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW supplying Steam Generator 1A/1B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by Control Room PZR instrumentation and Control Room RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by Control Room instrumentation. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by Control Room Instrumentation. 6. SG Level - Steam Generator 1A/1B/1C level is monitored by Control Room instrumentation.	

## Fire Safety Analysis

**Fire Area ID:** 056B-U1 - DG Building Switchgear Room Train B & Foyer  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 056B-U1 - DG Building Switchgear Room Train B & Foyer  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	056B-U1 - DG Building Switchgear Room Train B & Foyer NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-2), Unit 1 and 2 Diesel Gen Bldg Foyer/Train B Swgr Rm (Fire Area 056B, 056C)(New Fire Area 056B), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• A long term manual action to shift service water discharge from the circ water canal to recirculate to the service water pond can be performed by manually repositioning valve Q1P16V539.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-2), Unit 1 and 2 Diesel Gen Bldg Foyer/Train B Swgr Rm (Fire Area 056B, 056C)(New Fire Area 056B), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 056B-U2 - DG Building Switchgear Room Train B & Foyer  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2A. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 056B-U2 - DG Building Switchgear Room Train B & Foyer  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	056B-U2 - DG Building Switchgear Room Train B & Foyer	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A	Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B	Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 056B-U2 - DG Building Switchgear Room Train B & Foyer  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	056B-U2 - DG Building Switchgear Room Train B & Foyer NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-2), Unit 1 and 2 Diesel Gen Bldg Foyer/Train B Swgr Rm (Fire Area 056B, 056C)(New Fire Area 056B), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• A long term manual action to shift service water discharge from the circ water canal to recirculate to the service water pond can be performed by manually repositioning valve Q1P16V539.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-2), Unit 1 and 2 Diesel Gen Bldg Foyer/Train B Swgr Rm (Fire Area 056B, 056C)(New Fire Area 056B), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 057-U1 - Diesel Generator Room 2C  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump and swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve or a letdown path containment isolation valve. Excess letdown is isolated using an one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump and swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV, aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored in the Control Room. 6. SG Level - Steam Generator 1A/1B/1C level is monitored in the Control Room.	

## Fire Safety Analysis

**Fire Area ID:** 057-U1 - Diesel Generator Room 2C

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond OR Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 057-U2 - Diesel Generator Room 2C  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using an excess one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A/Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 057-U2 - Diesel Generator Room 2C

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 058-U1 - Diesel Generator Room 1B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump charging pump and swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump and swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves and the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV and aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2.2.RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3.3.Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3.4.RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs.5.SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by SG pressure Ch 1/CH 2/CH3.6.SG Level - Steam Generator 1A/1B/1C level is monitored in the Control Room.	

## Fire Safety Analysis

**Fire Area ID:** 058-U1 - Diesel Generator Room 1B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A.2.4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 058-U2 - Diesel Generator Room 1B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2A. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 058-U2 - Diesel Generator Room 1B

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	058-U2 - Diesel Generator Room 1B	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	058-U2 - Diesel Generator Room 1B NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-2), Unit 1 and 2 Diesel Gen Bldg Foyer/Train B Swgr Rm (Fire Area 056B, 056C)(New Fire Area 056B), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

**Fire Area ID:** 059-U1 - Diesel Generator Room 2B

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A.2.4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 059-U2 - Diesel Generator Room 2B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach aux spray for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2A. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 059-U2 - Diesel Generator Room 2B

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 060-U1 - Diesel Generator Room 1C  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV and aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2.2.RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3.3.Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3.4.RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs.5.SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by SG pressure Ch 1/CH 2/CH3.6.SG Level - Steam Generator 1A/1B/1C level is monitored by narrow range Ch 1/CH 2/CH3, wide range non-safety channel.	

## Fire Safety Analysis

<b>Fire Area ID:</b>	060-U1 - Diesel Generator Room 1C	<b>Nuclear Safety Performance Goals</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-1B.2.4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	060-U1 - Diesel Generator Room 1C	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A	Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B	Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Fire Area ID:</b>	060-U1 - Diesel Generator Room 1C	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	060-U1 - Diesel Generator Room 1C	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-1), Unit 1 and 2 Diesel Generator Building Train A Switchgear Room (Fire Area 056A), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)
-------------------------	--

<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.</li></ul>
------------------------	---

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
-------------------------	--

<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul>
------------------------	--

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 060-U2 - Diesel Generator Room 1C  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 060-U2 - Diesel Generator Room 1C

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	060-U2 - Diesel Generator Room 1C	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A	Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	060-U2 - Diesel Generator Room 1C NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-1), Unit 1 and 2 Diesel Generator Building Train A Switchgear Room (Fire Area 056A), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	061-U1 - Diesel Generator Room 1-2A	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Licensing Action**      Appendix R Exemption (No. 1-1), Unit 1 and 2 Diesel Generator Building Train A Switchgear Room (Fire Area 056A), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

**Licensing Basis**      Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- The construction and the installation of door/transom assemblies separating the switchgear room from the diesel generator rooms, and the configuration of the in-situ combustibles in the diesel generator building Train A switchgear room, provide reasonable assurance that fire would not propagate into the communicating diesel generator rooms.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

**Licensing Action**      Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

**Licensing Basis**      Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 061-U2 - Diesel Generator Room 1-2A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach aux spray for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 061-U2 - Diesel Generator Room 1-2A

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled and drainage capacity exceeds the expected fire suppression flow. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 062 - Day Fuel Tank Room 2C  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	

## Fire Safety Analysis

**Fire Area ID:** 062 - Day Fuel Tank Room 2C  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 3. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 4. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 062 - Day Fuel Tank Room 2C  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 062 - Day Fuel Tank Room 2C  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 063 - Day Fuel Tank Room 1B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 064 - Day Fuel Tank Room 2B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	

## Fire Safety Analysis

**Fire Area ID:** 064 - Day Fuel Tank Room 2B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 064 - Day Fuel Tank Room 2B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

<b>Fire Zone ID:</b>	DGB-DFT-1C - Day Fuel Tank Room 1C	

### Fire Doors

System/Feature ID	Description	Ch.3	Ch.4	Reason(s)	Monitoring	HSS
U0-FNP-S-DGB/DGB-65/71-155 D703	0:00,	-	Yes	-- B: Required to support a fire area boundary evaluation.	Yes	Yes

### Electrical Raceway Fire Barrier Systems

—

### Other Passive Features

System/Feature ID	Ch.3	Ch.4	Reason(s)	Monitor	HSS
U0-65-NA-DFT-1C-Restricted transient controls	-	Yes	-- E: Required to support a fire area boundary evaluation.	Yes	-

## Fire Safety Analysis

**Fire Area ID:** 065 - Day Fuel Tank Room 1C  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	

## Fire Safety Analysis

**Fire Area ID:** 065 - Day Fuel Tank Room 1C  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B/SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-1B/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 067 - RWIS Pump Room B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	

## Fire Safety Analysis

**Fire Area ID:** 067 - RWIS Pump Room B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B/SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-1B/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 068 - RWIS Pump Room A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 069 - RWIS Switchgear Room-Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.

4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 070 - RWIS Switchgear Room-Train A  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Nuclear Safety Performance Goals

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 071 - DG Building Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump, or TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 071 - DG Building Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B/SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 071 - DG Building Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 071 - DG Building Corridor

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 072-U1 - Service Water Pump Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump and swing charging pump via Train A power or Train B charging pump and swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump and swing charging pump via Train A power or Train B charging pump and swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump and swing charging pump via Train A power or Train B charging pump and swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW or Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2.2.RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3.3.Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3.4.RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs.5.SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by SG pressure Ch 1/CH 2/CH3.6.SG Level - Steam Generator 1A/1B/1C level is monitored by narrow range Ch 1/CH 2/CH3, wide range non-safety channel.	

## Fire Safety Analysis

**Fire Area ID:** 072-U1 - Service Water Pump Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by off-site power via SUT 1A/SUT 1B and diesel generator EDG1-2A or EDG-1B.2.4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A or Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities within the area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 072-U1 - Service Water Pump Room

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluations**

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	072-U1 - Service Water Pump Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-3), Unit 1 and 2 SWIS (Old FA 072A - New FA 072);(Old FA 072B/072C-New FA 075)(Old FA 072D/072E-New FA 076) 20 feet separation without intervening combustibles with automatic fire suppression (III.G.2.b criteria)
<b>Licensing Basis</b>	<p>As the result of a review of the current fire protection licensing basis for the SWIS, several changes were made consistent with the current, deterministic fire protection license condition. In addition, a risk-informed, performance-based integrated analysis was performed to eliminate reliance on Kaowool in the SWIS.</p> <p>Exemption Request per 08/28/2003 SNC letter to the NRC provides justification for lack of adequate separation of redundant equipment in a revision to Exemption Request No. 1-3, which was approved by the NRC in a letter dated 08/16/2005.</p> <ol style="list-style-type: none"><li>1. Service Water Pumps: Plant modifications resulted in removing the need for lubricating oil and coolant pumps, valves and their control stations in Unit 2. Accordingly, the condition in the exemption for this situation will no longer be needed and should be removed.</li><li>2. FNP Unit 2 side of strainer pit: A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 2 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li><li>3. FNP Unit 1 side of strainer pit A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 1 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li><li>4. Discharge valves to wet pit and storage pond flume: A deterministic re-analysis, consistent with the current licensing basis, shows that existing long-term manual actions regarding safe shutdown Services Water Train A and B cables are no longer required.</li><li>5. Swing Service Water Pumps: Service Water alignment procedures remove power from the subject swing pump discharge valves, thus precluding spurious valve operation and adverse impact on the Service Water system. The compliance strategy under the revised approach is unchanged.</li><li>6. Swing Service Water Pump cables in Fire Zones 72D and 72E (new Fire Area 076): The current exemption and bases for redundant swing Service Water pump cables in Fire Zones 72D and 72E (new Fire Area 076) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. Following the modifications, the fire areas (72D/72E) (new Fire Area 076) will comply with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li><li>7. Swing Service Water Pump cables in Fire Zones 72B and 72C (new Fire Area 075): The current exemption bases for redundant swing Service Water pump cables in Fire Zone 72B and 72C (new Fire Area 075) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. With installation of the modifications, the fire area (72B/72C) (new Fire Area 075) complies with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li><li>8. Raceways for Train A Service Water Pumps: An integrated risk assessment shows that safe shutdown can be achieved even if no credit is taken for the Kaowool raceway enclosures. This finding is also based, in part, on a re-determination of the safe shutdown success criterion, using traditional thermal-hydraulic techniques. The exemption should be revised not only to eliminate reliance of Kaowool but also to recognize the new success criterion.</li><li>9. Redundant raceways near the ceiling in the northeast corner: Train B raceways required for safe shutdown are wrapped with Kaowool. An integrated risk assessment shows that fire damage would not occur to these cables or the redundant Train A cables even if no credit were taken for Kaowool. Accordingly, the condition in the exemption for this configuration can be revised to eliminate reliance on Kaowool.</li><li>10. Additionally, the issue covered in the "Addendum to Exemption Request 1-3, Fire Area 72" was resolved with a plant modification, therefore the addendum can be deleted."</li></ol> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area was resolved by the revision to this Exemption Request, and by DCP 03-0-9940, DCP 03-0-9940, DCP 00-2-9686, DCP 03-1-9900, RIPB,. and various Administrative Controls.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

<b>Fire Area ID:</b>	072-U1 - Service Water Pump Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"><li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li><li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li><li>• The weld strength is equivalent to that of the structural supporting steel material.</li><li>• A seismic event is not postulated to occur concurrently with the fire.</li></ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 072-U2 - Service Water Pump Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump and swing charging pump via Train A power or Train B charging pump and swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump and swing charging pump via Train A power or Train B charging pump and swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump and swing charging pump via Train A power or Train B charging pump and swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW pump or Train B MDAFW pump and TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C} pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 072-U2 - Service Water Pump Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A or EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A or Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities within the area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 072-U2 - Service Water Pump Room

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Engineering Evaluations**

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	072-U2 - Service Water Pump Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-3), Unit 1 and 2 SWIS (Old FA 072A - New FA 072);(Old FA 072B/072C-New FA 075)(Old FA 072D/072E-New FA 076) 20 feet separation without intervening combustibles with automatic fire suppression (III.G.2.b criteria)
<b>Licensing Basis</b>	<p>As the result of a review of the current fire protection licensing basis for the SWIS, several changes were made consistent with the current, deterministic fire protection license condition. In addition, a risk-informed, performance-based integrated analysis was performed to eliminate reliance on Kaowool in the SWIS.</p> <p>Exemption Request per 08/28/2003 SNC letter to the NRC provides justification for lack of adequate separation of redundant equipment in a revision to Exemption Request No. 1-3, which was approved by the NRC in a letter dated 08/16/2005.</p> <ol style="list-style-type: none"> <li>1. Service Water Pumps: Plant modifications resulted in removing the need for lubricating oil and coolant pumps, valves and their control stations in Unit 2. Accordingly, the condition in the exemption for this situation will no longer be needed and should be removed.</li> <li>2. FNP Unit 2 side of strainer pit: A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 2 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li> <li>3. FNP Unit 1 side of strainer pit A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 1 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li> <li>4. Discharge valves to wet pit and storage pond flume: A deterministic re-analysis, consistent with the current licensing basis, shows that existing long-term manual actions regarding safe shutdown Services Water Train A and B cables are no longer required.</li> <li>5. Swing Service Water Pumps: Service Water alignment procedures remove power from the subject swing pump discharge valves, thus precluding spurious valve operation and adverse impact on the Service Water system. The compliance strategy under the revised approach is unchanged.</li> <li>6. Swing Service Water Pump cables in Fire Zones 72D and 72E (new Fire Area 076): The current exemption and bases for redundant swing Service Water pump cables in Fire Zones 72D and 72E (new Fire Area 076) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. Following the modifications, the fire areas (72D/72E) (new Fire Area 076) will comply with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li> <li>7. Swing Service Water Pump cables in Fire Zones 72B and 72C (new Fire Area 075): The current exemption bases for redundant swing Service Water pump cables in Fire Zone 72B and 72C (new Fire Area 075) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. With installation of the modifications, the fire area (72B/72C) (new Fire Area 075) complies with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li> <li>8. Raceways for Train A Service Water Pumps: An integrated risk assessment shows that safe shutdown can be achieved even if no credit is taken for the Kaowool raceway enclosures. This finding is also based, in part, on a re-determination of the safe shutdown success criterion, using traditional thermal-hydraulic techniques. The exemption should be revised not only to eliminate reliance of Kaowool but also to recognize the new success criterion.</li> <li>9. Redundant raceways near the ceiling in the northeast corner: Train B raceways required for safe shutdown are wrapped with Kaowool. An integrated risk assessment shows that fire damage would not occur to these cables or the redundant Train A cables even if no credit were taken for Kaowool. Accordingly, the condition in the exemption for this configuration can be revised to eliminate reliance on Kaowool.</li> <li>10. Additionally, the issue covered in the "Addendum to Exemption Request 1-3, Fire Area 72" was resolved with a plant modification, therefore the addendum can be deleted."</li> </ol> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area was resolved by the revision to this Exemption Request, and by DCP 03-0-9940, DCP 03-0-9940, DCP 00-2-9686, DCP 03-1-9900, RIPB,. and various Administrative Controls.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

<b>Fire Area ID:</b>	072-U2 - Service Water Pump Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 073 - SWIS Battery Room-Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve, or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 073 - SWIS Battery Room-Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B/SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-1B/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 073 - SWIS Battery Room-Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 073 - SWIS Battery Room-Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 074 - SWIS Battery Room-Train A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve, or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 074 - SWIS Battery Room-Train A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B/SUT 2A/SUT 2B, diesel generator EDG-1B/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 074 - SWIS Battery Room-Train A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 075-U1 - SWIS 5 kV Switchgear Room B & West Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2.2.RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel and RCS wide range pressure for Loop 1/Loop 3.3.Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3.4.RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs.5.SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by SG pressure Ch 1/CH 2/CH3.6.SG Level - Steam Generator 1A/1B/1C level is monitored by narrow range Ch 1/CH 2/CH3 and wide range non-safety channel.	

## Fire Safety Analysis

**Fire Area ID:** 075-U1 - SWIS 5 kV Switchgear Room B & West Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by {off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A.2.4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	075-U1 - SWIS 5 kV Switchgear Room B & West Stairs	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-3), Unit 1 and 2 SWIS (Old FA 072A - New FA 072);(Old FA 072B/072C-New FA 075)(Old FA 072D/072E-New FA 076) 20 feet separation without intervening combustibles with automatic fire suppression (III.G.2.b criteria)
<b>Licensing Basis</b>	<p>As the result of a review of the current fire protection licensing basis for the SWIS, several changes were made consistent with the current, deterministic fire protection license condition. In addition, a risk-informed, performance-based integrated analysis was performed to eliminate reliance on Kaowool in the SWIS.</p> <p>Exemption Request per 08/28/2003 SNC letter to the NRC provides justification for lack of adequate separation of redundant equipment in a revision to Exemption Request No. 1-3, which was approved by the NRC in a letter dated 08/16/2005.</p> <ol style="list-style-type: none"><li>1. Service Water Pumps: Plant modifications resulted in removing the need for lubricating oil and coolant pumps, valves and their control stations in Unit 2. Accordingly, the condition in the exemption for this situation will no longer be needed and should be removed.</li><li>2. FNP Unit 2 side of strainer pit: A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 2 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li><li>3. FNP Unit 1 side of strainer pit A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 1 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li><li>4. Discharge valves to wet pit and storage pond flume: A deterministic re-analysis, consistent with the current licensing basis, shows that existing long-term manual actions regarding safe shutdown Services Water Train A and B cables are no longer required.</li><li>5. Swing Service Water Pumps: Service Water alignment procedures remove power from the subject swing pump discharge valves, thus precluding spurious valve operation and adverse impact on the Service Water system. The compliance strategy under the revised approach is unchanged.</li><li>6. Swing Service Water Pump cables in Fire Zones 72D and 72E (new Fire Area 076): The current exemption and bases for redundant swing Service Water pump cables in Fire Zones 72D and 72E (new Fire Area 076) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. Following the modifications, the fire areas (72D/72E) (new Fire Area 076) will comply with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li><li>7. Swing Service Water Pump cables in Fire Zones 72B and 72C (new Fire Area 075): The current exemption bases for redundant swing Service Water pump cables in Fire Zone 72B and 72C (new Fire Area 075) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. With installation of the modifications, the fire area (72B/72C) (new Fire Area 075) complies with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li><li>8. Raceways for Train A Service Water Pumps: An integrated risk assessment shows that safe shutdown can be achieved even if no credit is taken for the Kaowool raceway enclosures. This finding is also based, in part, on a re-determination of the safe shutdown success criterion, using traditional thermal-hydraulic techniques. The exemption should be revised not only to eliminate reliance of Kaowool but also to recognize the new success criterion.</li><li>9. Redundant raceways near the ceiling in the northeast corner: Train B raceways required for safe shutdown are wrapped with Kaowool. An integrated risk assessment shows that fire damage would not occur to these cables or the redundant Train A cables even if no credit were taken for Kaowool. Accordingly, the condition in the exemption for this configuration can be revised to eliminate reliance on Kaowool.</li><li>10. Additionally, the issue covered in the "Addendum to Exemption Request 1-3, Fire Area 72" was resolved with a plant modification, therefore the addendum can be deleted."</li></ol> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area was resolved by the revision to this Exemption Request, and by DCP 03-0-9940, DCP 03-0-9940, DCP 00-2-9686, DCP 03-1-9900, RIPB,. and various Administrative Controls.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

<b>Fire Area ID:</b>	075-U1 - SWIS 5 kV Switchgear Room B & West Stairs	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 075-U2 - SWIS 5 kV Switchgear Room B & West Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 075-U2 - SWIS 5 kV Switchgear Room B & West Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	075-U2 - SWIS 5 kV Switchgear Room B & West Stairs	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A	Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B	Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	075-U2 - SWIS 5 kV Switchgear Room B & West Stairs	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

### Licensing Action

Appendix R Exemption (No. 1-3), Unit 1 and 2 SWIS (Old FA 072A - New FA 072);(Old FA 072B/072C-New FA 075)(Old FA 072D/072E-New FA 076) 20 feet separation without intervening combustibles with automatic fire suppression (III.G.2.b criteria)

### Licensing Basis

As the result of a review of the current fire protection licensing basis for the SWIS, several changes were made consistent with the current, deterministic fire protection license condition. In addition, a risk-informed, performance-based integrated analysis was performed to eliminate reliance on Kaowool in the SWIS.

Exemption Request per 08/28/2003 SNC letter to the NRC provides justification for lack of adequate separation of redundant equipment in a revision to Exemption Request No. 1-3, which was approved by the NRC in a letter dated 08/16/2005.

1. Service Water Pumps: Plant modifications resulted in removing the need for lubricating oil and coolant pumps, valves and their control stations in Unit 2. Accordingly, the condition in the exemption for this situation will no longer be needed and should be removed.
2. FNP Unit 2 side of strainer pit: A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 2 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.
3. FNP Unit 1 side of strainer pit A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 1 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.
4. Discharge valves to wet pit and storage pond flume: A deterministic re-analysis, consistent with the current licensing basis, shows that existing long-term manual actions regarding safe shutdown Services Water Train A and B cables are no longer required.
5. Swing Service Water Pumps: Service Water alignment procedures remove power from the subject swing pump discharge valves, thus precluding spurious valve operation and adverse impact on the Service Water system. The compliance strategy under the revised approach is unchanged.
6. Swing Service Water Pump cables in Fire Zones 72D and 72E (new Fire Area 076): The current exemption and bases for redundant swing Service Water pump cables in Fire Zones 72D and 72E (new Fire Area 076) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. Following the modifications, the fire areas (72D/72E) (new Fire Area 076) will comply with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.
7. Swing Service Water Pump cables in Fire Zones 72B and 72C (new Fire Area 075): The current exemption bases for redundant swing Service Water pump cables in Fire Zone 72B and 72C (new Fire Area 075) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. With installation of the modifications, the fire area (72B/72C) (new Fire Area 075) complies with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.
8. Raceways for Train A Service Water Pumps: An integrated risk assessment shows that safe shutdown can be achieved even if no credit is taken for the Kaowool raceway enclosures. This finding is also based, in part, on a re-determination of the safe shutdown success criterion, using traditional thermal-hydraulic techniques. The exemption should be revised not only to eliminate reliance of Kaowool but also to recognize the new success criterion.
9. Redundant raceways near the ceiling in the northeast corner: Train B raceways required for safe shutdown are wrapped with Kaowool. An integrated risk assessment shows that fire damage would not occur to these cables or the redundant Train A cables even if no credit were taken for Kaowool. Accordingly, the condition in the exemption for this configuration can be revised to eliminate reliance on Kaowool.
10. Additionally, the issue covered in the "Addendum to Exemption Request 1-3, Fire Area 72" was resolved with a plant modification, therefore the addendum can be deleted."

Elimination of the reliance on Kaowool raceway fire barriers in this area was resolved by the revision to this Exemption Request, and by DCP 03-0-9940, DCP 03-0-9940, DCP 00-2-9686, DCP 03-1-9900, RIPB,. and various Administrative Controls.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

<b>Fire Area ID:</b>	075-U2 - SWIS 5 kV Switchgear Room B & West Stairs	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 076-U1 - SWIS 5 kV Switchgear Room A & East Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAPW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2.2.RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/CH 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3.3.Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/CH 3.4.RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs.5.SG Pressure - Steam Generator 1A/1B/1C pressure is monitored by SG pressure Ch 1/CH 2/CH3.6.SG Level - Steam Generator 1A/1B/1C level is monitored by narrow range Ch 1/CH 2/CH3 and wide range non-safety channel.	

## Fire Safety Analysis

**Fire Area ID:** 076-U1 - SWIS 5 kV Switchgear Room A & East Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-1B.2.4.16 kV and 600 V power is supplied by Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	076-U1 - SWIS 5 kV Switchgear Room A & East Stairs	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the two code editions</li><li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li><li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	076-U1 - SWIS 5 kV Switchgear Room A & East Stairs	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	076-U1 - SWIS 5 kV Switchgear Room A & East Stairs	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-3), Unit 1 and 2 SWIS (Old FA 072A - New FA 072);(Old FA 072B/072C-New FA 075)(Old FA 072D/072E-New FA 076) 20 feet separation without intervening combustibles with automatic fire suppression (III.G.2.b criteria)
<b>Licensing Basis</b>	<p>As the result of a review of the current fire protection licensing basis for the SWIS, several changes were made consistent with the current, deterministic fire protection license condition. In addition, a risk-informed, performance-based integrated analysis was performed to eliminate reliance on Kaowool in the SWIS.</p> <p>Exemption Request per 08/28/2003 SNC letter to the NRC provides justification for lack of adequate separation of redundant equipment in a revision to Exemption Request No. 1-3, which was approved by the NRC in a letter dated 08/16/2005.</p> <ol style="list-style-type: none"><li>1. Service Water Pumps: Plant modifications resulted in removing the need for lubricating oil and coolant pumps, valves and their control stations in Unit 2. Accordingly, the condition in the exemption for this situation will no longer be needed and should be removed.</li><li>2. FNP Unit 2 side of strainer pit: A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 2 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li><li>3. FNP Unit 1 side of strainer pit A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 1 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.</li><li>4. Discharge valves to wet pit and storage pond flume: A deterministic re-analysis, consistent with the current licensing basis, shows that existing long-term manual actions regarding safe shutdown Services Water Train A and B cables are no longer required.</li><li>5. Swing Service Water Pumps: Service Water alignment procedures remove power from the subject swing pump discharge valves, thus precluding spurious valve operation and adverse impact on the Service Water system. The compliance strategy under the revised approach is unchanged.</li><li>6. Swing Service Water Pump cables in Fire Zones 72D and 72E (new Fire Area 076): The current exemption and bases for redundant swing Service Water pump cables in Fire Zones 72D and 72E (new Fire Area 076) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. Following the modifications, the fire areas (72D/72E) (new Fire Area 076) will comply with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li><li>7. Swing Service Water Pump cables in Fire Zones 72B and 72C (new Fire Area 075): The current exemption bases for redundant swing Service Water pump cables in Fire Zone 72B and 72C (new Fire Area 075) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. With installation of the modifications, the fire area (72B/72C) (new Fire Area 075) complies with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.</li><li>8. Raceways for Train A Service Water Pumps: An integrated risk assessment shows that safe shutdown can be achieved even if no credit is taken for the Kaowool raceway enclosures. This finding is also based, in part, on a re-determination of the safe shutdown success criterion, using traditional thermal-hydraulic techniques. The exemption should be revised not only to eliminate reliance of Kaowool but also to recognize the new success criterion.</li><li>9. Redundant raceways near the ceiling in the northeast corner: Train B raceways required for safe shutdown are wrapped with Kaowool. An integrated risk assessment shows that fire damage would not occur to these cables or the redundant Train A cables even if no credit were taken for Kaowool. Accordingly, the condition in the exemption for this configuration can be revised to eliminate reliance on Kaowool.</li><li>10. Additionally, the issue covered in the "Addendum to Exemption Request 1-3, Fire Area 72" was resolved with a plant modification, therefore the addendum can be deleted."</li></ol> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area was resolved by the revision to this Exemption Request, and by DCP 03-0-9940, DCP 03-0-9940, DCP 00-2-9686, DCP 03-1-9900, RIPB,. and various Administrative Controls.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 076-U2 - SWIS 5 kV Switchgear Room A & East Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 076-U2 - SWIS 5 kV Switchgear Room A & East Stairs  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	076-U2 - SWIS 5 kV Switchgear Room A & East Stairs	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	076-U2 - SWIS 5 kV Switchgear Room A & East Stairs	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

### Licensing Action

Appendix R Exemption (No. 1-3), Unit 1 and 2 SWIS (Old FA 072A - New FA 072);(Old FA 072B/072C-New FA 075)(Old FA 072D/072E-New FA 076) 20 feet separation without intervening combustibles with automatic fire suppression (III.G.2.b criteria)

### Licensing Basis

As the result of a review of the current fire protection licensing basis for the SWIS, several changes were made consistent with the current, deterministic fire protection license condition. In addition, a risk-informed, performance-based integrated analysis was performed to eliminate reliance on Kaowool in the SWIS.

Exemption Request per 08/28/2003 SNC letter to the NRC provides justification for lack of adequate separation of redundant equipment in a revision to Exemption Request No. 1-3, which was approved by the NRC in a letter dated 08/16/2005.

1. Service Water Pumps: Plant modifications resulted in removing the need for lubricating oil and coolant pumps, valves and their control stations in Unit 2. Accordingly, the condition in the exemption for this situation will no longer be needed and should be removed.
2. FNP Unit 2 side of strainer pit: A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 2 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.
3. FNP Unit 1 side of strainer pit A deterministic re-analysis, consistent with the current licensing basis, shows that fire damage to cables on the Unit 1 side of the strainer pit cannot result in spurious operation of the valves. Accordingly, the bases for the condition in the exemption for this situation should be modified to remove reliance on Kaowool.
4. Discharge valves to wet pit and storage pond flume: A deterministic re-analysis, consistent with the current licensing basis, shows that existing long-term manual actions regarding safe shutdown Services Water Train A and B cables are no longer required.
5. Swing Service Water Pumps: Service Water alignment procedures remove power from the subject swing pump discharge valves, thus precluding spurious valve operation and adverse impact on the Service Water system. The compliance strategy under the revised approach is unchanged.
6. Swing Service Water Pump cables in Fire Zones 72D and 72E (new Fire Area 076): The current exemption and bases for redundant swing Service Water pump cables in Fire Zones 72D and 72E (new Fire Area 076) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. Following the modifications, the fire areas (72D/72E) (new Fire Area 076) will comply with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.
7. Swing Service Water Pump cables in Fire Zones 72B and 72C (new Fire Area 075): The current exemption bases for redundant swing Service Water pump cables in Fire Zone 72B and 72C (new Fire Area 075) remain unchanged because they do not involve Kaowool. Although the walls are unrated as clearly stated in the licensing basis, the unlikely potential exists for fire propagation between redundant trains in the event of a severe, uncontrolled fire. Nevertheless, an upgrade to the barriers was determined to be a cost-effective modification that could enhance fire safety and help compensate for other elements of defense-in-depth that have been modified as part of the risk-informed, performance-based approach. With installation of the modifications, the fire area (72B/72C) (new Fire Area 075) complies with the separation criteria of 10 CFR 50, Appendix R, Section III.G.2 required by the FNP Fire Protection Program. Therefore, a condition in the exemption will not be required for these new fire areas.
8. Raceways for Train A Service Water Pumps: An integrated risk assessment shows that safe shutdown can be achieved even if no credit is taken for the Kaowool raceway enclosures. This finding is also based, in part, on a re-determination of the safe shutdown success criterion, using traditional thermal-hydraulic techniques. The exemption should be revised not only to eliminate reliance of Kaowool but also to recognize the new success criterion.
9. Redundant raceways near the ceiling in the northeast corner: Train B raceways required for safe shutdown are wrapped with Kaowool. An integrated risk assessment shows that fire damage would not occur to these cables or the redundant Train A cables even if no credit were taken for Kaowool. Accordingly, the condition in the exemption for this configuration can be revised to eliminate reliance on Kaowool.
10. Additionally, the issue covered in the "Addendum to Exemption Request 1-3, Fire Area 72" was resolved with a plant modification, therefore the addendum can be deleted."

Elimination of the reliance on Kaowool raceway fire barriers in this area was resolved by the revision to this Exemption Request, and by DCP 03-0-9940, DCP 03-0-9940, DCP 00-2-9686, DCP 03-1-9900, RIPB,. and various Administrative Controls.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 093 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C/2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	

## Fire Safety Analysis

**Fire Area ID:** 093 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C/2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C/2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B/SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-1B/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 093 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment F Code Compliance Evaluation for NFPA 14, 2007 Edition, Standard for Installation of Standpipes and Hose Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 14, 2007 Edition. The approach was to determine the applicable code edition for the applicable systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Standpipe and hose systems were determined to be compliant with the relevant sections of NFPA 14, 2007 Edition, with the exception of the non-compliances identified in the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1976.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

## Fire Safety Analysis

**Fire Area ID:** 093 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 093 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 1-001 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT and stopping the reactor makeup water pumps to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump aligned to Train B power.</li> <li>Unit 2: Subcritical conditions are maintained by preventing boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump, or swing charging pump.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 1: RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.</li> <li>Unit 2: RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	<ul style="list-style-type: none"> <li>Unit 1: Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> <li>Unit 2: Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.</li> </ul>	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump, or swing charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-001 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	<ul style="list-style-type: none"> <li>Unit 1: Positive control of RCS pressure is accomplished with Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.</li> <li>Unit 2: Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.</li> </ul>	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1A. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A/B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored in the Control Room.</li> </ul>	
7.1 Vital Auxiliaries – Electrical	<ul style="list-style-type: none"> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 1-001 - Aux Building  
**Compliance Basis:** Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation addresses a select number of fire doors that occasionally may not automatically latch closed due to "abnormal air pressure".</p> <p>Bases for Acceptability:</p> <p>The specific fire doors cited are PA101, 201 and 497. The evaluation justifies the door latching deviation by taking credit for plant staff that ensure all fire doors are closed after entry or egress.</p>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A    Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Fire Area ID:</b>	1-001 - Aux Building	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

Fire Area ID: 1-001 - Aux Building		Previously Approved Engineering Evaluations
Compliance Basis: Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach		
Licensing Action	Appendix R Exemption (No. 1-36), Unit 1 Auxiliary Building Elevation 83 ft., 100 ft., and 121 ft. (Fire Area 1-001) Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain the control of the charging line isolation valves, pressurizer PORVs and block valves and the main steam atmospheric relief valves.</li><li>• Manual action within the area (to restore instrument air to the pressurizer PORVs) is not an immediate requirement, and considered a long term manual action.</li><li>• A sprinkler system modification has been completed in the hatchway area of room 163 such that upon activation, it will form a water curtain to prevent the spread of fire to other plant areas via the non-rated steel hatchway.</li></ul> <p>For charging pump operation:</p> <ul style="list-style-type: none"><li>• There is a high degree of separation between rooms 183 and 223.</li><li>• The part of room 223 through which the train-B charging pump room cooler and the swing charging pump room cooler cables are routed is covered by an automatic sprinkler system.</li><li>• Both rooms are protected by automatic smoke detection system.</li></ul> <p>Although not specifically addressed in the APC and NRC correspondence for this exemption request, the FSAR provided the following justification for the lack of area wide smoke detection in this fire area:</p> <ul style="list-style-type: none"><li>• The rooms without detection are duct and pipe chases, and tendon access rooms that do not contain any safe shutdown equipment or raceways.</li><li>• The rooms do not contain any flammable or combustible materials except for room 112, which contains IEEE 383 qualified cable insulation.</li></ul> <p>For Initiation of Safety Signals:</p> <ul style="list-style-type: none"><li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 1-39), Unit 1 Aux Building (Fire Area 1-004), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>For the non-fire rated hatch covers:</p> <ul style="list-style-type: none"><li>• Suppression system in room 163 in the area of the subject steel hatch cover</li><li>• Analysis of safe shutdown showed that physical separation was adequate</li><li>• Detection system provided in rooms 163 and 103</li><li>• Sprinkler systems in room 345 and 454 will serve the purpose of a water curtain to prevent the passage of fire through the non-rated steel hatch.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-001 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 1: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 2: NFPA 805, Section 4.2.3 Deterministic Approach	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"><li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li><li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li><li>• The weld strength is equivalent to that of the structural supporting steel material.</li><li>• A seismic event is not postulated to occur concurrently with the fire.</li></ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 1-004-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV block valve and Train B PORV block valve. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray are not operating. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 1B. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1.Shutdown Margin - Performance based approach ensure adequate shutdown margin.2.RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 2/CH 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3.3.Pressurizer Level - Pressurizer level is monitored by PZR level Ch 2.4.RCS Temperature - RCS Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs.5.SG Pressure - Steam Generator 1B pressure is monitored in the Control Room.6.SG Level - Steam Generator 1B/1C level is monitored in the Control Room.	
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B.2.4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 1-004-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b> 1-004-U1 - Aux Building <b>Compliance Basis:</b> NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		<b>Engineering Evaluations</b>
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 7, TE-BE-03-9898-001, Technical Evaluation in Support of GL 86-10 for DCP 03-1-9898, Reroute Appendix R RWST Suction Valve Cables	
<b>Inactive</b>	Yes	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	Purpose:  The purpose of the evaluation is to assess the adequacy of the separation for redundant trains of the RWST suction valves. The valves are not separated in accordance with the requirements of Appendix R, Section III.G.2 in that the area of spatial separation is not provided with whole area suppression.  Bases for Acceptability:  The acceptability of the evaluation is based on spatial separation, location of combustibles, limited in situ combustibles, whole area detection with partial suppression, and fire barriers. In addition, administrative controls have been established to maintain the non-suppressed area free of transient combustibles or to establish compensatory actions.	
<b>Engineering Evaluation ID</b>	ENGDOC, DOEJ-SM-03-0415-001 Applicability of NFPA 80 Door Closer Requirements	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	Purpose:  This evaluation addresses a select number of fire doors that occasionally may not automatically latch closed due to "abnormal air pressure".  Bases for Acceptability:  The specific fire doors cited are PA101, 201 and 497. The evaluation justifies the door latching deviation by taking credit for plant staff that ensure all fire doors are closed after entry or egress.	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment A Code Compliance Evaluation for NFPA 10, 2007 Edition, Standard for Portable Fire Extinguishers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	Purpose:  This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 10, 2007 Edition. The approach was to determine the applicable code edition for the applicable portable fire extinguishers, identify applicable sections of the code requiring verification, and perform those verifications.  Bases for Acceptability:	

## Fire Safety Analysis

**Fire Area ID:** 1-004-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

- An applicability determination was completed to identify the relevant sections of the code
- Portable fire extinguishers were determined to be compliant with the relevant sections of NFPA 10, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment B Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the two code editions
- The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations
- Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment D Code Compliance Evaluation for NFPA 13, 2007 Edition, Preaction Sprinkler Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the preaction sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the applicable codes
- The preaction sprinkler systems were determined to be compliant with the relevant sections of NFPA 13-2007 and NFPA 13-1975, with the exception of the

## Fire Safety Analysis

**Fire Area ID:** 1-004-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-004-U1 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-39), Unit 1 Aux Building (Fire Area 1-004), Enclosure of one train of redundant cable by a 1 hr rated barrier with automatic suppression (III.G.2.c criteria) and separation by 3 hr barrier (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression and lack of separation of redundant trains by 3 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>For redundant electrical power distribution system:</p> <ul style="list-style-type: none"> <li>• The redundant MCCs 1A and 1B are separated by a 2-ft-thick reinforced concrete floor at el 139 ft - 0 in.</li> <li>• Unsealed penetrations have been reviewed and will not affect separation.</li> <li>• Minimum horizontal separation between components is approximately 60 feet with complete automatic suppression coverage at el 121 ft - 0 in.</li> <li>• The redundant dc distribution panels 1C and 1F are separated by a 2-ft-thick reinforced concrete floor at el 139 ft.</li> <li>• The minimum horizontal separation between these redundant panels is approximately 40 ft and has complete automatic suppression coverage at el 121 ft - 0 in. and 139 ft - 0 in.</li> <li>• A smoke detection system is installed in all rooms containing the subject equipment.</li> <li>• Manual hose stations, portable extinguishers, and portable smoke removal equipment are available for use on the subject elevations.</li> </ul> <p>For steam generator pressure instrumentation:</p> <ul style="list-style-type: none"> <li>• A fire rated barrier has been provided in room 462 for raceways 21E047, 21E048, 31E017, 41E019 and 41E017.</li> <li>• A fire rated barrier inside the following conduits is provided where they attach to pull boxes located in room 462 -21E045, 21E047, 31E018, 31E020, 41E017, and 41E019.</li> <li>• Partial suppression system covers the area of modification In the east portion of room 462.</li> <li>• Unsealed penetrations in the subject wall have been reviewed.</li> <li>• Approximate 32-ft horizontal separation between redundant steam generator pressure instruments and cabling.</li> <li>• Smoke detection system in rooms</li> <li>• Automatic fixed suppression system and the barriers provided for redundant cabling in room 462 would protect the redundant S/G B and C instrumentation.</li> <li>• A portable extinguisher and manual hose station are available for use in room 464.</li> <li>• Based upon the modification, the existing raceway barriers, smoke detection, and fixed suppression in the area, a credible fire in room 462 would not affect the ability to monitor S/G A pressure.</li> <li>• Control room actions can be performed for resetting spurious SI, CVI, or CI safety signals.</li> </ul> <p>For instrument air:</p> <ul style="list-style-type: none"> <li>• Redundant cables are separated by a 2-ft-thick reinforced concrete floor at el 121 ft - 0 in. and 139 ft - 0 in.</li> <li>• Unsealed penetrations in the subject floors have been reviewed and will not affect the separation afforded by the concrete floor.</li> <li>• Train A cables have full suppression coverage on el 100 ft - 0 in. and el 139 ft - 0 in.</li> <li>• Train B cables have full suppression coverage on el 121 ft - 0 in.</li> <li>• Smoke detection system is installed in all rooms containing the subject cabling.</li> <li>• Manual hose stations and portable extinguishers are available for use on the subject elevations.</li> </ul> <p>For battery room ventilation:</p> <ul style="list-style-type: none"> <li>• The requirement for battery and battery charger room ventilation is a long term requirement.</li> <li>• Either portable ventilation equipment will be installed in the effected room(s) or</li> <li>• The damaged ventilation system will be repaired within 20 hours of post-fire hot shutdown initiation to insure that battery room hydrogen concentrations do not</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** 1-004-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

Previously Approved Engineering Evaluations

exceed acceptable limits.

For boration/makeup, depressurization, and RCP seal integrity:

- A fire rated barrier has been provided for train-A power cable raceway ADDA21, ADDA18, ADDA15, and ADDA09.
- The existing fire rated barrier on raceway BFDB03 has been extended and a fire rated barrier for raceway BHFA03 is being provided
- An open penetration in floor slab has been sealed.
- Suppression coverage is provided in rooms 163, 162, 161, 160, 175, and 186.
- Redundant power cables are separated by a 2-ft-thick reinforced concrete wall bounding rooms with the exception of room 155, where there is approximately 32 ft of separation.
- Unsealed penetrations have been reviewed and the walls afford adequate separation.
- A smoke detection system is installed in all rooms containing the subject charging pump cabling.
- Manual hose stations, portable extinguishers, and portable smoke removal equipment are available for use on this elevation.
- EI 100 ft - 0 in. Train-B cables are protected by a fire rated barrier which extends to a point of 40-ft horizontal separation from the redundant train-A cables.
- Automatic fired suppression and smoke detection systems provide coverage for the subject cables.
- EI 121 ft - 0 in. redundant cables have a minimum horizontal separation of approximately 40 ft.
- The train-B power and control cables are provided with automatic suppression and smoke detection coverage
- Redundant train-A and -B charging pump room cooler power and control cables are separated by a 2-ft-thick reinforced concrete slab floor at el 121 ft - 0 in.
- Unsealed penetrations in the floor slab have been reviewed and are considered to afford adequate separation.

For main steam isolation:

- Manual action can be performed to manually trip the TDAFW pump throttle valve Q1N12MOV3406-A.

For steam release (cooldown):

- Manual action can be performed to open or close the atmospheric relief valves.

For neutron flux monitoring:

- Configuration of redundant equipment cables and equipment with respect to barriers would limit the fire to one train of equipment.
- Unsealed penetrations in the subject floor slab have been reviewed and are considered not to affect the separation afforded by the concrete floor.

For reactor coolant boundary integrity:

- Manual action can be performed to remove power from all cables in the shared raceway. This can be accomplished by opening the supply breaker on 125 V-dc switchgear 1A (Q1R42B001A-A) for 125 V-dc distribution panel 1C (Q1R41L001C-A).

For the lack of full area smoke/fire detection:

- All cabling in rooms without detection is routed in conduits.
- There are no combustibles in these rooms.
- There are no functionally redundant safe shutdown cables in these rooms.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-1-9941, DCP 03-1-9926, DCP 03-1-9928, DCP 03-1-9898, and DCP 03-1-9902. Note that raceway 31E020 with Kaowool raceway fire barrier is not addressed in the Kaowool elimination resolution table.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

Fire Area ID: 1-004-U1 - Aux Building Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-39), Unit 1 Aux Building (Fire Area 1-004), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request 05/31/1985 and 10/18/1985 APC letters to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <p>For the non-fire rated hatch covers:</p> <ul style="list-style-type: none"><li>• Suppression system in room 163 in the area of the subject steel hatch cover</li><li>• Analysis of safe shutdown showed that physical separation was adequate</li><li>• Detection system provided in rooms 163 and 103</li><li>• Sprinkler systems in room 345 and 454 will serve the purpose of a water curtain to prevent the passage of fire through the non-rated steel hatch.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-40), Units 1 and 2 (Rooms 173, 161, 171, 170, 175, 174, 179, 181, 2173, 2161, 2170, 2171, 2175, 2174 and 2181) 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"><li>• The fire severity in the affected rooms is less than 30 minutes for all cases.</li><li>• A sprinkler system is installed in rooms 161, 179, 2161, and 2179</li><li>• Smoke detection systems in all rooms will provide early warning capability and protection from the spread of a fire from one room to the next.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	1-004-U1 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)

### Licensing Basis

Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:

All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:

- Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.
- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

0340-U2	340 Demineralizer Compartment	

## Fire Safety Analysis

**Fire Area ID:** 1-004-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Fire Area Definition**

Fire Zone ID	Description	Elevation(s)
0341-U2	341 Pipe Chase	
0342-U2	342 Spent-Fuel Pool Pump Room	
0348-U2	348 Cask Wash Area	
0351-U2	Chiller Surge Tank Room	
0400-U2	Primary Access Point	
0402-U2	402 Passage to Unit 2	
0403-U2	403 Hot Instrument Shop	
0405-U2	405 Hatch Room	
0406-U2	406 Decontamination Room	
0407-U2	407 Hot Machine Shop	
0408-U2	408 Hallway	
0409-U2	409 Hallway	
0410A-U2	410A 600-V Load Center	
0410B-U2	410B 600-V Load Center	
0415-U2	415 Corridor	
0417-U2	417 Corridor	
0418-U2	418 Auxiliary Building and Containment Purge Vent Equipment Room	
0419-U2	419 Demineralizer Hatch Area	
0422-U2	422 Corridor	
0423-U2	423 Valve Compartment	
0424-U2	424 Demineralizer Compartment	
0425-U2	425 Demineralizer Compartment	
0426-U2	426 Demineralizer Compartment	
0427-U2	427 Demineralizer Compartment	
0429-U2	429 Containment Purge Air Equipment Room	
0432-U2	432 Corridor	
0438-U2	438 Hot Water Heater Room	
0441-U2	441 Tool Room	
0445-U2	445 Spent-Fuel Pool Heat Exchanger Room	
0446-U2	446 Hallway	
0448-U2	448 SFPC Pump Room	
0449-U2	449 Demineralizer Room	
0450-U2	450 Valve Compartment	
0451-U2	451 Filter Room	
0453-U2	453 Clean Janitor	
0454-U2	454 Lobby	
0455-U2	455 Clean Toilet Room (Men's)	
0456-U2	456 Drying Area	
0461-U2	461 Dosimetry Lab
