## Fire Safety Analysis

**Fire Area ID:** 2-039 - Fuel Storage & Storage Rack Pits  
**Fire Zone ID:** 2459 - 2459 New Fuel Storage Room

**Systems and Features**

### Other Passive Features

## Fire Safety Analysis

**Fire Area ID:** 2-039 - Fuel Storage & Storage Rack Pits  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 2: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump aligned to Train A power.</li> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 2: RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.</li> <li>Unit 1: RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-039 - Fuel Storage & Storage Rack Pits  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"><li>• Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li><li>• Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li></ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-039 - Fuel Storage & Storage Rack Pits	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** 2-040-U1 - Cable Spreading Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-040-U1 - Cable Spreading Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of the manual carbon dioxide suppression system will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-040-U1 - Cable Spreading Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001 Fire Barrier Penetration Seal Limiting Design Parameter Evaluation
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>Evaluate various penetration seals which, as a result of plant walkdowns of as built configurations, exhibited one or more Limiting Design Parameters (LDPs) which were outside limits previously established via qualification test reviews.</p> <p>Bases for Acceptability:</p> <p>The basis of the evaluation was to establish the acceptability of the field established configurations through either:</p> <ul style="list-style-type: none"> <li>• Utilizing engineering judgment based on additional reviews of test reports to justify the LDP in question;</li> <li>• Refinement of field judgments through review of design drawing/documentation; or</li> <li>• Establishing additional technical bases which allowed reapplication of acceptance criteria for LDPs.</li> </ul>
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment B Code Compliance Evaluation for NFPA 12, 2008 Edition, Standard on Carbon Dioxide Extinguishing Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 12, 2008 Edition and NFPA 12, 1973 Edition. The approach was to determine the applicable code editions for carbon dioxide extinguishing systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the two code editions</li> <li>• The carbon dioxide systems were determined to be compliant with the relevant sections of NFPA-12-2008 and NFPA 12-1973, with the exception of the non-compliances identified in the evaluations</li> <li>• Some non-compliances against the 2008 edition were resolved by vetting against the 1973 edition, which has been identified by SNC as the FNP code of record</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>

<b>Fire Area ID:</b>	2-040-U1 - Cable Spreading Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-040-U1 - Cable Spreading Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-040-U2 - Cable Spreading Room  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by {isolating the VCT / stopping the reactor makeup water pumps} to prevent boron dilution and by charging borated water from the RWST using {Train A charging pump / Train B charging pump / swing charging pump aligned to Train A / Train B power}.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs. CCW to RCP thermal barriers are isolated using the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring the Loop 1 and Loop 2 RCPs are shut off.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAPW pump supplying Steam Generator 2A.	
6 Process Monitoring	Essential processes are monitored by dedicated instruments at the hot shutdown panel.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

## Fire Safety Analysis

**Fire Area ID:** 2-040-U2 - Cable Spreading Room

**Nuclear Safety Performance Goals**

**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of the manual carbon dioxide suppression system will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-040-U2 - Cable Spreading Room	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-040-U2 - Cable Spreading Room	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-041-U1 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-041-U1 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-041-U1 - Train A Switchgear & Load Center Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001 Fire Barrier Penetration Seal Limiting Design Parameter Evaluation	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluate various penetration seals which, as a result of plant walkdowns of as built configurations, exhibited one or more Limiting Design Parameters (LDPs) which were outside limits previously established via qualification test reviews.</p> <p>Bases for Acceptability:</p> <p>The basis of the evaluation was to establish the acceptability of the field established configurations through either:</p> <ul style="list-style-type: none"> <li>• Utilizing engineering judgment based on additional reviews of test reports to justify the LDP in question;</li> <li>• Refinement of field judgments through review of design drawing/documentation; or</li> <li>• Establishing additional technical bases which allowed reapplication of acceptance criteria for LDPs.</li> </ul>

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those</p>

## Fire Safety Analysis

**Fire Area ID:** 2-041-U1 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-041-U1 - Train A Switchgear & Load Center Rooms NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-24), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-24), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-26), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria) (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assembly between rooms 2346 (Fire Area 2-041) and 2345 (Fire Area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> <li>• There are water hose stations and an automatic water suppressions system</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-041-U1 - Train A Switchgear & Load Center Rooms	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-12), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.
- A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

### Licensing Action

Appendix R Exemption (No. 2-12), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-13), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated nonsafety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/85:

- Based on the construction, the installation of the door/transom assembly between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the insitu combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 2-041-U2 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring normal and auxiliary spray valves remain closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAPW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-041-U2 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1.Electrical power is supplied by diesel generator EDG-2B.2.4.16 kV and 600 V power is supplied by Train B distribution equipment.3.125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled. Initiation of carbon dioxide suppression systems will not damage components needed for safe shutdown; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-041-U2 - Train A Switchgear & Load Center Rooms	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001 Fire Barrier Penetration Seal Limiting Design Parameter Evaluation	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluate various penetration seals which, as a result of plant walkdowns of as built configurations, exhibited one or more Limiting Design Parameters (LDPs) which were outside limits previously established via qualification test reviews.</p> <p>Bases for Acceptability:</p> <p>The basis of the evaluation was to establish the acceptability of the field established configurations through either:</p> <ul style="list-style-type: none"> <li>• Utilizing engineering judgment based on additional reviews of test reports to justify the LDP in question;</li> <li>• Refinement of field judgments through review of design drawing/documentation; or</li> <li>• Establishing additional technical bases which allowed reapplication of acceptance criteria for LDPs.</li> </ul>

<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those</p>

## Fire Safety Analysis

**Fire Area ID:** 2-041-U2 - Train A Switchgear & Load Center Rooms  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Licensing Action</b>	Appendix R Exemption (No. 1-24), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-24), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-26), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria) (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assembly between rooms 2346 (Fire Area 2-041) and 2345 (Fire Area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> <li>• There are water hose stations and an automatic water suppressions system</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-041-U2 - Train A Switchgear & Load Center Rooms	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-12), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:

- Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.
- A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

### Licensing Action

Appendix R Exemption (No. 2-12), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-13), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated nonsafety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/85:

- Based on the construction, the installation of the door/transom assembly between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the insitu combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 2-042-U1 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-042-U1 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-042-U1 - Aux Building Hallways & Corridor	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-97-1561-001 Fire Barrier Penetration Seal Limiting Design Parameter Evaluation	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
----------------------------------	--

<b>Inactive</b>	No
-----------------	----

<b>Functionally Equivalent</b>	Yes
--------------------------------	-----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

<b>Engineering Evaluation ID</b>	ENGDOC, TE-BE-03-9902-002, Technical Evaluation in Support of FL 86-10 for DCP 03-1-9902 Install Fire Rated M.I. Cables in Fire Areas 1-013; 1-042, 2-013; and 2-042 for Control Circuits Associated With DG 1-2A and DG 1C
----------------------------------	---

<b>Inactive</b>	Yes
-----------------	-----

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.

Bases for Acceptability:

- The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on
- full area detection and suppression;

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-042-U1 - Aux Building Hallways & Corridor	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- limited fire hazards;
- an assessment of in situ combustibles; and
- the substantial construction of the fire area boundary.

To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.

<b>Engineering Evaluation ID</b>	ENGDOC, TE-BE-9906-002, Technical Evaluation in Support of GL 86-10 for DCP 03-2-9906
<b>Inactive</b>	Yes
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the significance of in-situ combustibles and fire hazards located between redundant Appendix R SSD raceways.</p> <p>Bases for Acceptability:</p> <p>The basis for the evaluation is that the in situ combustibles and potential fire hazards do not pose an unacceptable risk given an evaluation based on the closest point of the raceways and a conservative assessment of the in situ combustibles, types of combustible, and potential fire hazards. The evaluation further credits both the ionization detection and the automatic sprinkler systems in the rooms.</p>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-042-U1 - Aux Building Hallways & Corridor NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-24), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-26), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain the control of one main steam atmospheric relief valve and to monitor RCS boron concentration.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-26), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria) (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:</p> <ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assembly between rooms 2346 (Fire Area 2-041) and 2345 (Fire Area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> <li>• There are water hose stations and an automatic water suppressions system</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-042-U1 - Aux Building Hallways & Corridor	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-12), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-13), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, and lack of 3 hour barrier separating redundant trains, which was approved by the NRC in a letter dated 11/19/85:

- Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin and to regain the control of the pressurizer PORVs.
- A design change installed as a result of Regulatory Guide (RG) 1.97, provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.
- All required electrical Train-B safe shutdown cabling in room 2319 has been provided with a barrier having a fire rating greater than that of the projected maximum exposure fire severity of 30-min duration.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by Re-analysis supported by Generic Letter 86-10 Evaluation, DCP 03-1-9902, DCP 03-2-9904, DCP 03-2-9906, DCP 03-2-9936, DCP 03-2-9939, Exemption for the use of the fire-rated cables, and OA for control of MDAFW flow control valves and aligning of the backup Nitrogen for the PORVs.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-042-U1 - Aux Building Hallways & Corridor	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Licensing Action** Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)

**Licensing Basis** Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):

- The MI cable support span is within the fire test configurations.
- The materials for the MI cable supports are bounded by the fire test configurations.
- The MI cable installation hardware is in accordance with the fire test configurations.
- The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.
- The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.
- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 2-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using excess letdown isolation valves. PZR PORV leakage paths are isolated using Train A PORV and performance-based approach Train B PORV or block valve. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are performance-based approach isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and performance-based approach Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump supplying Steam Generator 2C. Main feed is performance-based approach isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - Performance-based approach RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Performance-based approach pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Performance-based approach Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Performance-based approach Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Performance-based approach Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-042-U2 - Aux Building Hallways & Corridor	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	DRAW, A-506301, Appendix 10, DOEJ-BE-03-9901-002, Acceptance Insulation Resistance (IR) For the Fire-Rated Control Cables for Farley Nuclear Power Plant DCPs 1029990101, 1039990201, and DCP 2039990601	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to assess the use of 1-hour fire-rated cables as a replacement for Kaowool raceway fire barriers used to protect one train of the redundant safe shutdown function cables within the same fire area. Specifically, the evaluation assesses the insulation resistance (IR) of the 1-hour fire-rated cables to ensure that the electrical equipment connected to the control circuits would remain functional at the elevated control circuit conductor temperature during a fire.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on the establishment of a minimum acceptable IR value for Farley specific application of the 1-hour fire-rated cables, evaluation of the potential leakage current in the cables when at elevated temperatures, and comparison of the cable's IR value, determined from fire test results, to the established minimum criteria.</p>	
<b>Engineering Evaluation ID</b>	DRAW, A506301, Appendix 12, TE-BE-03-9902-001 Evaluation of Circuit Length Increases in DCP 03-1-9902	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation is to verify that changes in control circuit lengths identified in DCP 03-1-9902 are within the identified limits, for existing plant configuration. Some portions of DC control circuits have been replaced with new fire rated M.I. cables to reduce the reliance on Kaowool raceway fire barriers, thus changing the length of the circuits.</p> <p>Bases for Acceptability:</p> <p>The acceptability of the evaluation is based on a comparison of the total resistance of the new control circuit during a potential fire, including a portion of M.I. cable at an elevated temperature, to the maximum permissible resistance value.</p>

<b>Functionally Equivalent</b>	No
--------------------------------	----

<b>Adequate for the Hazard</b>	No
--------------------------------	----

<b>Summary</b>	Purpose:
----------------	----------

The evaluation is to assess the adequacy of the spatial separation based on in situ combustibles and potential fire hazards located between redundant trains of Fire Safe Shutdown (SSD) equipment.

Bases for Acceptability:

The evaluation determined that the spatial separation provides reasonable assurance that a fire would not damage both SSD trains. This conclusion was based on

- full area detection and suppression;

## Fire Safety Analysis

**Fire Area ID:** 2-042-U2 - Aux Building Hallways & Corridor  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

- limited fire hazards;
- an assessment of in situ combustibles; and
- the substantial construction of the fire area boundary.

To ensure the combustible loading in the area of the redundant trains is not increased, the combustible control program is required to be updated to maintain the area of spatial separation free of transients.

**Engineering Evaluation ID** ENGDOC, TE-BE-9906-002, Technical Evaluation in Support of GL 86-10 for DCP 03-2-9906

**Inactive** Yes

**Functionally Equivalent** No

**Adequate for the Hazard** No

**Summary** Purpose:

The purpose of the evaluation is to assess the significance of in-situ combustibles and fire hazards located between redundant Appendix R SSD raceways.

Bases for Acceptability:

The basis for the evaluation is that the in situ combustibles and potential fire hazards do not pose an unacceptable risk given an evaluation based on the closest point of the raceways and a conservative assessment of the in situ combustibles, types of combustible, and potential fire hazards. The evaluation further credits both the ionization detection and the automatic sprinkler systems in the rooms.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-042-U2 - Aux Building Hallways & Corridor NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-24), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:	
	<ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assemblies between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> </ul>	
	This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-26), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 09/10/1986:	
	<ul style="list-style-type: none"> <li>• Manual operator actions can be performed to regain the control of one main steam atmospheric relief valve and to monitor RCS boron concentration.</li> <li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li> </ul>	
	This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-26), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria) (III.G.2.a criteria)	
<b>Licensing Basis</b>	Exemption request per 05/31/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 09/10/1986:	
	<ul style="list-style-type: none"> <li>• The construction and the installation of door/transom assembly between rooms 2346 (Fire Area 2-041) and 2345 (Fire Area 2-042), and the configuration of the in-situ combustibles, provide reasonable assurance that fire would not propagate to the adjacent fire area.</li> <li>• There are water hose stations and an automatic water suppressions system</li> </ul>	
	This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:	
	<ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-042-U2 - Aux Building Hallways & Corridor	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-12), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-041), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:

- Based on the construction, the installation of the door/transom assembly between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the in-situ combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Licensing Action

Appendix R Exemption (No. 2-13), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)

### Licensing Basis

Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, and lack of 3 hour barrier separating redundant trains, which was approved by the NRC in a letter dated 11/19/85:

- Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin and to regain the control of the pressurizer PORVs.
- A design change installed as a result of Regulatory Guide (RG) 1.97, provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.
- All required electrical Train-B safe shutdown cabling in room 2319 has been provided with a barrier having a fire rating greater than that of the projected maximum exposure fire severity of 30-min duration.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by Re-analysis supported by Generic Letter 86-10 Evaluation, DCP 03-1-9902, DCP 03-2-9904, DCP 03-2-9906, DCP 03-2-9936, DCP 03-2-9939, Exemption for the use of the fire-rated cables, and OA for control of MDAFW flow control valves and aligning of the backup Nitrogen for the PORVs.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

<b>Licensing Action</b>	Appendix R Exemption (No. 2-13), Unit 2 Auxiliary Building, EI 139 ft (Fire Area 2-042), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated nonsafety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/85:</p> <ul style="list-style-type: none"> <li>• Based on the construction, the installation of the door/transom assembly between rooms 2346 (area 2-041) and 2345 (area 2-042), and the configuration of the insitu combustibles in these fire areas, a fire would not propagate through the transom opening and spread into the adjacent fire areas.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-31), Non-Rad. Side Corridor - Auxiliary Building EI 121 ft. (Fire Area 2-020), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Steel equipment hatch covers located in the floor and ceiling of fire area 2-020, room 2234 which form part of fire area boundary with fire areas 2-006, room 2185 and 2-042, room 2345 respectively are not fire-rated.</li> <li>• The steel hatch covers are protected by a suppression system.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"> <li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li> <li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li> <li>• The weld strength is equivalent to that of the structural supporting steel material.</li> <li>• A seismic event is not postulated to occur concurrently with the fire.</li> </ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-042-U2 - Aux Building Hallways & Corridor	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Licensing Action** Appendix R Exemption (Use of MI cable), Unit 1 and 2 Auxiliary Building (Fire Areas 1-013, 1-042, 2-013, 2-042) 1 hour enclosure (III.G.2.c criteria)

**Licensing Basis** Exemption request per APC letter to the NRC provides the following justification for use of MI cables as 1 hour enclosure to protect Train A onsite power system related SSD circuits, with automatic fire suppression and detection, which was approved by the NRC in letters dated 02/13/2006 (Unit 2) and 03/22/2006 (Unit 1):

- The MI cable support span is within the fire test configurations.
- The materials for the MI cable supports are bounded by the fire test configurations.
- The MI cable installation hardware is in accordance with the fire test configurations.
- The MI cable conductor-to-conductor and conductor-to-sheath minimum insulation resistance measured during the fire test and during the post-fire hose test would not affect the functioning of the components connected to the control cables. The evaluation included the effects of the reduced insulation resistance for the potential spurious actuation of the associated control devices and the control power supply protection breaker or fuse due to an increase in the leakage current.
- The cable conductor resistance of the MI cables at 1700°F has been evaluated and found to be acceptable for the minimum required control circuit voltage at the components during a fire event. The maximum temperature from the ASTM E119 curve for a 1-h fire test is 1700°F.
- The fire areas which take credit for the 1-h fire rating of the MI cables are provided with smoke detection and automatic fire suppression throughout the fire area.

In conclusion, the bases for previous acceptance remains valid.

This exemption is no longer required because the subject cables have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

## Fire Safety Analysis

**Fire Area ID:** 2-043-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-043-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-043-U1 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-043-U1 - Aux Building NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-2), Unit 2 Auxiliary Building, EI 155 ft and 175 ft (Fire Area 2-043), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression(III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Rooms containing redundant equipment and cabling (2464 and 2462) are separated by a non-fire-rated concrete wall.</li> <li>• Room 2462 contains full coverage preaction sprinkler system.</li> <li>• The insitu combustible fire loading in both rooms is low with a maximum fire severity of less than 30 minutes.</li> <li>• The S/G-A pressure transmitters located in room 2464 are physically separated by a minimum distance of 12 ft from the redundant S/G-B pressure transmitters, a distance greater than 30 ft from the redundant S/G-C pressure transmitters, and are located approximately 8 ft from the concrete wall separating rooms 2464 and 2462. The S/G-B pressure transmitters and the redundant S/G-C pressure transmitters located in room 2462 are physically separated by a distance greater than 20 ft.</li> <li>• Two channels of the redundant S/G-A, S/G-B, and S/G-C pressure transmitter cable raceways routed through room 2462 have been protected with fire barriers.</li> <li>• Manual actions can be performed to restore ventilation to the Train A battery room.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9906.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-043-U1 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"><li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li><li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li><li>• The weld strength is equivalent to that of the structural supporting steel material.</li><li>• A seismic event is not postulated to occur concurrently with the fire.</li></ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-043-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAPW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Performance-based approach Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-043-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolate	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-043-U2 - Aux Building  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-043-U2 - Aux Building NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-2), Unit 2 Auxiliary Building, EI 155 ft and 175 ft (Fire Area 2-043), Enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression(III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letters to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Rooms containing redundant equipment and cabling (2464 and 2462) are separated by a non-fire-rated concrete wall.</li> <li>• Room 2462 contains full coverage preaction sprinkler system.</li> <li>• The insitu combustible fire loading in both rooms is low with a maximum fire severity of less than 30 minutes.</li> <li>• The S/G-A pressure transmitters located in room 2464 are physically separated by a minimum distance of 12 ft from the redundant S/G-B pressure transmitters, a distance greater than 30 ft from the redundant S/G-C pressure transmitters, and are located approximately 8 ft from the concrete wall separating rooms 2464 and 2462. The S/G-B pressure transmitters and the redundant S/G-C pressure transmitters located in room 2462 are physically separated by a distance greater than 20 ft.</li> <li>• Two channels of the redundant S/G-A, S/G-B, and S/G-C pressure transmitter cable raceways routed through room 2462 have been protected with fire barriers.</li> <li>• Manual actions can be performed to restore ventilation to the Train A battery room.</li> <li>• Plant procedures exist for resetting spurious SI, CVI and CI safety signals from the main control room.</li> </ul> <p>Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9906.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-043-U2 - Aux Building	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Licensing Action** Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)

**Licensing Basis** Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:

All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:

- Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.
- The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.
- The weld strength is equivalent to that of the structural supporting steel material.
- A seismic event is not postulated to occur concurrently with the fire.

Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 2-054 - Aux Building Elevator Machine Room No. 4 and Elevator No. 1 Shaft  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-054 - Aux Building Elevator Machine Room No. 4 and Elevator No. 1 Shaft	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in Containment. There are no automatic suppression systems in Containment. Equipment is qualified for harsh environment, including water spray and vital equipment is located above the sump submergence level that would be expected during fire suppression activities. Therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-055 - Containment	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment F Code Compliance Evaluation for NFPA 14, 2007 Edition, Standard for Installation of Standpipes and Hose Systems
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 14, 2007 Edition. The approach was to determine the applicable code edition for the applicable systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Standpipe and hose systems were determined to be compliant with the relevant sections of NFPA 14, 2007 Edition, with the exception of the non-compliances identified in the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1976.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-055 - Containment	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (CB), Unit 1 and 2 Containment Buildings (Fire Areas 1-055, 2-055) 20 feet separation without intervening combustibles (III.G.2.d criteria)
<b>Licensing Basis</b>	<p>Exemption request per 06/18/1982 and 07/27/1982 APC letters to the NRC provides the following justification for the lack of 20 feet horizontal distance separation between safe shutdown circuits with no intervening combustibles, which was approved by the NRC in a letter dated 12/30/1983:</p> <p>For pressurizer vent paths:</p> <ul style="list-style-type: none"><li>• Redundant cables are routed in separate enclosures; within the enclosures, a hot short could not inadvertently open the PORVs.</li><li>• Alternate means of depressurization is provided by the pressurizer auxiliary spray which is separated from redundant equipment by 20 feet with no intervening combustibles.</li></ul> <p>For reactor vessel head vent system flow paths:</p> <ul style="list-style-type: none"><li>• Redundant cables are routed in separate enclosures; within the enclosures, a hot short could not inadvertently open the head vent valves.</li></ul> <p>For pressurizer pressure and level instrumentation:</p> <ul style="list-style-type: none"><li>• One train of primary system pressure indication is available with cables horizontally separated by more than 20 feet free of intervening combustibles from redundant counterparts</li></ul> <p>Furthermore, for all areas of concern, smoke detection and manual hose stations are provided in the area and access is restricted during plant operations reducing the likelihood of a transient combustible exposure fire. Also Containment cables are qualified to IEEE Standard 383, and are routed in conduit in the vicinity of the equipment, and are protected with overcurrent devices.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-075-U1 - Unit 2 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room OR Plant shutdown is performed from the Hot Shutdown Panel.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room OR Reactor is manually tripped from the Control Room prior to Control Room evacuation.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-075-U1 - Unit 2 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-075-U1 - Unit 2 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: 2-075-U1 - Unit 2 Cable Tunnel - Train A Compliance Basis: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions		Previously Approved Engineering Evaluations
Licensing Action	Appendix R Exemption (No. 1-8), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 2-075 Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N1B21TE413, N1B21TE423, and N1B21TE433.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 2-24), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 2-075), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Manual actions can be performed to regain control of one main steam atmospheric relief valve and to monitor boron concentration and shutdown margin.</li><li>• A design change installed as a result of Regulatory Guide (RG) 1.97 provides a redundant signal processing and indication between RCS hot leg temperature loops N2B21TE413, N2B21TE423, and N2B21TE433.</li></ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
Licensing Action	Appendix R Exemption (No. 2-24), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train A (Fire Area 2-075), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Fire resistant coating on a door has been placed in a surveillance program.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-075-U2 - Unit 2 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train B charging pump or swing charging pump via Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train B charging pump, or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train B charging pump or swing charging pump via Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train B PORV for pressure reduction and Pressurizer Heater Group B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using TrTrain B MDAFW pump supplying Steam Generator 2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Performance-based approach shutdown margin is monitored. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 3. 4. RCS Temperature - Performance-based approach RCS Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by diesel generator EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train B equipment.	

## Fire Safety Analysis

**Fire Area ID:** 2-075-U2 - Unit 2 Cable Tunnel - Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train B service water is provided with two service water pumps in service recirculating to the pond or Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train..	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-076-U1 - Unit 2 Cable Tunnel - Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** 2-076-U1 - Unit 2 Cable Tunnel - Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-076-U1 - Unit 2 Cable Tunnel - Train B	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-076-U1 - Unit 2 Cable Tunnel - Train B NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-12), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train B (Fire Area 2-076, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain normal control of the service water system, and to restore PORV instrument air by hand wheel operation of valve NIP19HV3885-B thus ensuring PORV QIB31PCV0445A-A will be operable to achieve RCS depressurization.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-12), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train B (Fire Area 2-076, Unit 1 cables), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The fire-resistant coatings on the watertight door between auxiliary building (area 2-030) and cable tunnel (area 2-076) have been placed under the licensee's fire protection surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-9), Unit 2 Auxiliary Building Cable Chase Train B (Fire Area 2-030, Unit 1 cables), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The fire-resistant coatings on the watertight door between auxiliary building (Fire Area 2-030) and cable tunnel (Fire Area 2-076) have been placed under the licensee's fire protection surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries either have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-25), Unit 2 Auxiliary Building Cable Chase Train B (Fire Area 2-030), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Fire resistant coating on a door has been placed in a surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-076-U2 - Unit 2 Cable Tunnel - Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with performance-based approach Train A PORV for pressure reduction and Pressurizer Heater Group A for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump supplying Steam Generator 2A. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2, RCS wide range pressure for Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2. 4. RCS Temperature - RCS Loop 1/Loop 2 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A equipment.	

## Fire Safety Analysis

**Fire Area ID:** 2-076-U2 - Unit 2 Cable Tunnel - Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.2 Vital Auxiliaries – Service Water	Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-076-U2 - Unit 2 Cable Tunnel - Train B	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment E Code Compliance Evaluation for NFPA 13, 2007 Edition, Wet Pipe Sprinkler Systems	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 13, 2007 Edition and NFPA 13, 1975 Edition. The approach was to determine the applicable code editions for the wet pipe sprinkler systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the applicable codes</li> <li>• The wet pipe sprinkler systems were determined to be compliant with the relevant sections of the codes, with the exception of the non-compliances identified in the report</li> <li>• Some non-compliances against the 2007 Edition were resolved by vetting against the 1975 edition, which has been identified by SNC as the FNP code of record</li> <li>• All other non-compliances were provided with justifications, or SNC has initiated actions to make document revisions or modifications to bring the element into compliance</li> </ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment F Code Compliance Evaluation for NFPA 14, 2007 Edition, Standard for Installation of Standpipes and Hose Systems

<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>	

## Fire Safety Analysis

Fire Area ID: Compliance Basis:	2-076-U2 - Unit 2 Cable Tunnel - Train B NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	Previously Approved Engineering Evaluations
<b>Licensing Action</b>	Appendix R Exemption (No. 1-12), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train B (Fire Area 2-076, Unit 1 cables), Enclosure of one train of redundant cable by a 1 hour rated fire barrier (III.G.2.c criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• Manual actions can be performed to regain normal control of the service water system, and to restore PORV instrument air by hand wheel operation of valve NIP19HV3885-B thus ensuring PORV QIB31PCV0445A-A will be operable to achieve RCS depressurization.</li> </ul> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-12), Unit 2 Auxiliary Building to Diesel Building Cable Tunnel Train B (Fire Area 2-076, Unit 1 cables), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The fire-resistant coatings on the watertight door between auxiliary building (area 2-030) and cable tunnel (area 2-076) have been placed under the licensee's fire protection surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-9), Unit 2 Auxiliary Building Cable Chase Train B (Fire Area 2-030, Unit 1 cables), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The fire-resistant coatings on the watertight door between auxiliary building (Fire Area 2-030) and cable tunnel (Fire Area 2-076) have been placed under the licensee's fire protection surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries either have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-25), Unit 2 Auxiliary Building Cable Chase Train B (Fire Area 2-030), lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating , which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"> <li>• Fire resistant coating on a door has been placed in a surveillance program.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-077 - Condensate Storage Tank  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-078 - Reactor Makeup Storage Tank  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** 2-080 - Low Voltage Switchyard - Unit 2  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. Each outdoor deluge system provides local protection for individual transformers, and are designed (using curbs, etc.) so water will remain in the vicinity of the affected equipment. Therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-080 - Low Voltage Switchyard - Unit 2  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment G Code Compliance Evaluation for NFPA 15, 2007 Edition, Water Spray Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

Evaluations were conducted to determine the current level of compliance with the applicable requirements of NFPA 15, 2007 Edition and NFPA 15, 1973 Edition. The approach was to determine the applicable code editions for the water spray systems, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the applicable codes
- The water spray systems were determined to be compliant with the relevant sections of NFPA 15-2007 and NFPA 15-1973, with the exception of the non-compliances identified in the evaluations
- Some non-compliances against the 2007 Edition were resolved by vetting against the 1973 Edition, which has been identified by SNC as the FNP code of record
- All other non-compliances have been provided with justifications

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 2-081 - Turbine Building Battery Room  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-089 - Lube Oil & Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Drainage capacity in the general Turbine Building area exceeds expected fire suppression flows. Local hazards protected by sprinkler or water spray systems have sufficient curbing and discharge of manual suppression water in adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Fire Area ID:** 2-090 - Aux Building Combustible Storage & Filter Unit Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-090 - Aux Building Combustible Storage & Filter Unit Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

## Fire Safety Analysis

**Fire Area ID:** 2-092 - Drumming Station & Storage & Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-096 - Aux Building Combustible Storage Room  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** 2-097 - Filter Hatch Room & Combustible Storage Area  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-097 - Filter Hatch Room & Combustible Storage Area	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M	Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment O	Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems
<b>Inactive</b>	No

<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-097 - Filter Hatch Room & Combustible Storage Area  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-098 - Caskwash Storage & Combustible Storage Area  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump, or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in adjacent areas. Essential equipment is protected from damage due to flooding from operation of the fire suppression system by drains and curbs and/or by mounting essential equipment on pedestals or supports. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-098 - Caskwash Storage & Combustible Storage Area  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance

**Engineering Evaluation ID** ENGDOC, SM-C051326701-007, Attachment O Code Evaluation for NFPA 90A, 2002 Edition, Installation of Air Conditioning and Ventilating Systems

**Inactive** No

**Functionally Equivalent** Yes

**Adequate for the Hazard** No

**Summary** Purpose:

This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 90A, 2002 Edition. The approach was to determine the applicable code edition for the applicable fire dampers, identify applicable sections of the code requiring verification, and perform those verifications.

Bases for Acceptability:

- An applicability determination was completed to identify the relevant sections of the code
- Fire dampers were determined to be compliant with the relevant sections of NFPA 90A, 2002 Edition, with the exception of the non-compliances identified in Table 6-1 of the report
- Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2002 edition non-compliances against the FNP code of record edition of 1974.
- All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.

**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-DU-DGRWIS-A - Diesel Building to RWIS Ductbank, Unit 2, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. ### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-DU-DGSWIS-B - Diesel Building to SWIS Ductbank, Unit 2, Train B  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. ### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained in this area due to embedded conduits. Cables in embedded conduits are protected from adverse conditions occurring due to fire suppression effects. Therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-S01 - Stairwell No. 1  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-S01 - Stairwell No. 1	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li> </ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>

## Fire Safety Analysis

<b>Fire Area ID:</b> <b>Compliance Basis:</b>	2-S01 - Stairwell No. 1 Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	<b>Previously Approved Engineering Evaluations</b>
<b>Licensing Action</b>	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"> <li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li> <li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li> <li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li> <li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li> <li>• Access to fire doors is routinely kept clear.</li> <li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li> <li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
<b>Licensing Action</b>	Appendix R Exemption (No. 2-35), Unit 2 Auxiliary Building, Elevations 100, 121, 127, 139, 155 and 175 ft. (Fire Area 2-006), ack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 and 10/18/1985 APC letters to the NRC provide the following justification for the lack of enclosure of one train of redundant cable by a 1 hour rated fire barrier with automatic fire suppression, which was approved by the NRC in a letter dated 12/29/1986 for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating:</p> <p>A non fire-rated, watertight door # 2170 exists between fire area 2-006, room 2190 and fire area 2-S01, Stairwell # 1; and a non fire-rated, pressure tight door # 2330 exists between fire area 2-006, room 2241 and fire area 2-S01, Stairwell # 1.</p> <ul style="list-style-type: none"> <li>• These doors are normally maintained closed. Smoke detection system is provided in rooms on both sides of these doors.</li> <li>• The smoke detection system in rooms 2190 and 2241 alarms locally and are annunciated in the main control room and will provide early warning of a pending fire condition, prompting a fire brigade response. The smoke detection system in stairwell # 1 is provided with only local alarm.</li> <li>• Portable extinguishers and fire hose cabinets are available nearby for fire brigade's use in stairwell # 1.</li> <li>• An automatic fire suppression system is provided in room 2190.</li> <li>• The combustible loading in room 2241 (main steam valve room) is less than 30 minutes and access to this area during plant operation is restricted. Based on the configuration and fire protection provided, a fire on either side of these doors will not propagate to the adjacent fire area.</li> </ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

## Fire Safety Analysis

**Fire Area ID:** 2-S02 - Stairwell No. 2  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	<ul style="list-style-type: none"> <li>Unit 2: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.</li> <li>Unit 1: Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.</li> </ul>	
3.1 RCS Inventory Control - RCS Makeup	<ul style="list-style-type: none"> <li>Unit 2: RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.</li> <li>Unit 1: RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.</li> </ul>	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	<ul style="list-style-type: none"> <li>Unit 2: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> <li>Unit 1: Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.</li> </ul>	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	

## Fire Safety Analysis

**Fire Area ID:** 2-S02 - Stairwell No. 2

Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.</li></ul>	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	ENGDOC, U-732257 Qualification of Three-Hour Rated Stairwell Enclosures
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>The purpose of the evaluation was to demonstrate the acceptability of three Promat H cement board enclosures constructed inside stairwells (two enclosures in Unit 1, Stairwell #2, and one enclosure in Unit 2, Stairwell #2) to provide separation and protection for various safety related circuits running through the stairs.</p> <p>Bases for Acceptability:</p> <p>The evaluation demonstrates that the three enclosures are functionally equivalent to three-hour fire resistance rated enclosures by comparing the FNP installations to Promat H assemblies that passed the three-hour fire resistance rating ASTM E-119 test.</p>

## Fire Safety Analysis

**Fire Area ID:** 2-S02 - Stairwell No. 2  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

		Previously Approved Engineering Evaluations
Fire Area ID:	2-S02 - Stairwell No. 2	
Compliance Basis:	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	
Licensing Action	Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)	
Licensing Basis	<p>Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:</p> <ul style="list-style-type: none"><li>• The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.</li><li>• Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.</li><li>• Smoke or heat detection systems are installed on both sides of the affected doors except as noted.</li><li>• The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.</li><li>• Access to fire doors is routinely kept clear.</li><li>• Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.</li><li>• The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>	
Licensing Action	Appendix R Exemption (No. 2-38), Multiple fire areas, Enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier (III.G.2 criteria)	
Licensing Basis	<p>Exemption request per 03/13/1985 and 10/18/ 1985 APC letters to the NRC provide the following justification for the lack of enclosure of structural steel supporting raceway fire barrier assemblies by a 1 hour fire rated barrier, which was approved by the NRC in a letter dated 12/29/1986:</p> <p>All safety-related tray and conduit supports which support raceways that are protected by a fire barrier were evaluated to determine the effects of a one hour ASTM E-119 exposure fire on the subject supports. The assumptions were:</p> <ul style="list-style-type: none"><li>• Maximum temperature attained in the area of fire influence is 1700°F for approximately one hour.</li><li>• The maximum area of fire influence is equal to that of a fire with a base of 20 feet in diameter.</li><li>• The weld strength is equivalent to that of the structural supporting steel material.</li><li>• A seismic event is not postulated to occur concurrently with the fire.</li></ul> <p>Utilizing the properties of steel at elevated temperatures, it was determined that the structural steel supports affected by the area of fire influence were of adequate strength to ensure that the raceway will retain their integrity for the required one hour fire duration.</p> <p>This exemption is no longer required because the fire risk evaluation, SE-C051326701-008, has found that the fire area is compliant with NFPA 805 Section 4.2.4.</p>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-S02 - Stairwell No. 2	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

**Licensing Action** Appendix R Exemption (No. 2-4), Unit 2 Auxiliary Building Stairwell No. 2 (Fire Area 2-S02), Installation of automatic fire suppression (III.G.2.c criteria)

**Licensing Basis** Exemption request per 03/13/1985 APC letters to the NRC provides the following justification for the lack of automatic fire suppression, which was approved by the NRC in a letter dated 11/19/1985:

- Redundant safe shutdown cabling has been enclosed in a fire barrier
- Smoke detection system has been provided.
- The in-situ combustible fire loading is low and consists only of cable insulation with a maximum fire severity of less than 1 hour.
- All non-safe shutdown cables in this fire area are enclosed in conduit.

Elimination of the reliance on Kaowool raceway fire barriers in this area is resolved by DCP 03-2-9938 and DCP 02-3-9899.

In conclusion, the bases for previous acceptance have been substantiated by field walkdown and by verification of change implementation.

This exemption is no longer required because the fire risk evaluation, SE-C051326701-008 has found that the fire area is compliant with NFPA 805, Section 4.2.4.

## Fire Safety Analysis

**Fire Area ID:** 2-S08 - Stairwell No. 8  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-S08 - Stairwell No. 8  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-S08 - Stairwell No. 8  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

## Fire Safety Analysis

**Fire Area ID:** 2-S10 - Stairwell No. 10  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment M Code Compliance Evaluation for NFPA 80, 2007 Edition, Fire Doors and Other Opening Protectives
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 80, 2007 Edition. The approach was to determine the applicable code edition for the applicable fire doors, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Fire doors were determined to be compliant with the relevant sections of NFPA 80, 2007 Edition, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the Farley code of record edition of 1973</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** 2-S10 - Stairwell No. 10  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Previously Approved Engineering Evaluations**

### Licensing Action

Appendix R Exemption (No. 1-41), Unit 1 and 2 Auxiliary Building, Diesel Generator Building and the Service Water Intake Structure, 3 hour rated fire barrier separating fire areas (III.G.2.a criteria)

### Licensing Basis

Exemption request per 10/18/1985 and 01/27/1986 APC letters to the NRC provide the following justification for the lack of 3 hour rated fire barrier separating fire areas, which was approved by the NRC in a letter dated 12/29/1986:

- The majority of the subject fire doors exceed NFPA 80 gap specifications by less than 3/4 of an inch.
- Most of the excessive clearances result from an unintentional unevenness of or slope in the concrete floors.
- Smoke or heat detection systems are installed on both sides of the affected doors except as noted.
- The in-situ combustible loading in the vicinity of the bottom of the doors is minimal.
- Access to fire doors is routinely kept clear.
- Since the gaps are at the bottom of the doors, passage of smoke and heat is minimized.
- The results of a liquid spill near a door with excessive clearance would not differ significantly from one near a door with prescribed clearance since a flow path exists under both doors.

This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-SVB1-A - Service Water Valve Box, 2-SVB1, Train A	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (No. 2-6), Service Water Valve Box No. 1 {Fire Area 2SVB1 (New: 2-SVB1-A and 2-SVB1-B)}, lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Subject valves are separated by a three-hour fire-rated concrete wall.</li><li>• All cables in fire area 2SVB1 are installed in conduit and the combustible loading is minimal.</li><li>• A fire would be contained in the individual compartment and could only communicate with the outside via a manhole cover in its roof.</li><li>• The effects of fire upon the redundant cable of the subject valve could cause them to become electrically inoperative, but they would not reposition from their required safe shutdown position. This insures that at a minimum one train of service water is available for safe shutdown.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	2-SVB1-B - Service Water Valve Box, 2-SVB1, Train B	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Licensing Action</b>	Appendix R Exemption (No. 2-6), Service Water Valve Box No. 1 {Fire Area 2SVB1 (New: 2-SVB1-A and 2-SVB1-B)}, lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provides the following justification for the lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Subject valves are separated by a three-hour fire-rated concrete wall.</li><li>• All cables in fire area 2SVB1 are installed in conduit and the combustible loading is minimal.</li><li>• A fire would be contained in the individual compartment and could only communicate with the outside via a manhole cover in its roof.</li><li>• The effects of fire upon the redundant cable of the subject valve could cause them to become electrically inoperative, but they would not reposition from their required safe shutdown position. This insures that at a minimum one train of service water is available for safe shutdown.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>	

## Fire Safety Analysis

**Fire Area ID:** 2-SVB4-B - Service Water Valve Box, 2-SVB4, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** 2-SVB4-B - Service Water Valve Box, 2-SVB4, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** 2-TB - Turbine Building General Area  
**Compliance Basis:** Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions  
 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by performance-based approach tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are performance-based approach shut off. Undesired pressure increase is prevented by performance-based approach deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Performance-based approach decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

 Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	<ul style="list-style-type: none"> <li>Unit 2: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.</li> <li>Unit 1: 1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.</li> </ul>	
7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved utilizing equipment and cables that have been reviewed to be unaffected by the effects of fire suppression activities in the area and adjacent areas. Drainage capacity in the general Turbine Building area exceeds expected fire suppression flows. Local hazards protected by sprinkler or water spray systems have sufficient curbing and discharge of manual suppression water in adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

<b>Compliance Basis:</b>	Unit 2: NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions Unit 1: NFPA 805, Section 4.2.3 Deterministic Approach	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment K Code Compliance Evaluation for NFPA 30, 2008 Edition, Flammable and Combustible Liquids Code
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	Yes
<b>Adequate for the Hazard</b>	No
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 30, 2008 Edition. The approach was to determine the applicable code edition for flammable &amp; combustible liquids, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Flammable and combustible liquids were determined to be compliant with the relevant sections of NFPA-30-2008, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were resolved in Appendix D, which vetted the 2008 edition non-compliances against the FNP code of record edition of 1972.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>

<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers
<b>Inactive</b>	No
<b>Functionally Equivalent</b>	No
<b>Adequate for the Hazard</b>	Yes
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** ABRF-U1 - Control Room Air Conditioner, Unit 1 & Unit 2  
**Fire Zone ID:** ABRF2-U1 - Control Room Air Conditioner/Unit 2 Side

**Systems and Features**

### Other Passive Features

## Fire Safety Analysis

**Fire Area ID:** ABRF-U1 - Control Room Air Conditioner, Unit 1 & Unit 2  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** ABRF-U1 - Control Room Air Conditioner, Unit 1 & Unit 2  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	ABRF-U1 - Control Room Air Conditioner, Unit 1 & Unit 2	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** ABRF-U2 - Control Room Air Conditioner, Unit 1 & Unit 2  
**Fire Zone ID:** ABRF2-U2 - Control Room Air Conditioner/Unit 2 Side

**Systems and Features**

### Other Passive Features

## Fire Safety Analysis

**Fire Area ID:** ABRF-U2 - Control Room Air Conditioner, Unit 1 & Unit 2  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** ABRF-U2 - Control Room Air Conditioner, Unit 1 & Unit 2  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by performance-based approach Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	ABRF-U2 - Control Room Air Conditioner, Unit 1 & Unit 2	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** DU-DGFOST-A - Diesel Fuel Oil Storage Tank Ductbank, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	<ul style="list-style-type: none"> <li>Unit 2: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.</li> <li>Unit 1: Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.</li> </ul>

7.1 Vital Auxiliaries Electrical	<ul style="list-style-type: none"> <li>Unit 2: 1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> <li>Unit 1: 1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.</li> </ul>	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

**Fire Area ID:** DU-DGFOST-A - Diesel Fuel Oil Storage Tank Ductbank, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** DU-SWISVB-A-U2 - SWIS to Valve Box Ductbank, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	

## Fire Safety Analysis

**Fire Area ID:** DU-SWISVB-A-U2 - SWIS to Valve Box Ductbank, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4. 16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Performance-based approach Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	DU-SWISVB-A-U2 - SWIS to Valve Box Ductbank, Train A	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** EMBED-DGB-U1 - Diesel Generator Building Embedded Conduit  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** EMBED-DGB-U1 - Diesel Generator Building Embedded Conduit  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained in this area due to embedded conduits. Cables in embedded conduits are protected from adverse conditions occurring due to fire suppression effects. Therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** EMBED-DGB-U1 - Diesel Generator Building Embedded Conduit  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

### Engineering Evaluations

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** EMBED-DGB-U2 - Diesel Generator Building Embedded Conduit  
**Compliance Basis:** NFPA 805, Section 4.2.3 Deterministic Approach

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.

## Fire Safety Analysis

**Fire Area ID:** SWWPVB-A-U1 - Service Water Valve Box Return to Wet Pit, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** SWWPVB-A-U1 - Service Water Valve Box Return to Wet Pit, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	SWWPVB-A-U1 - Service Water Valve Box Return to Wet Pit, Train A	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

**Fire Area ID:** SWWPVB-A-U2 - Service Water Valve Box Return to Wet Pit, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** SWWPVB-A-U2 - Service Water Valve Box Return to Wet Pit, Train A  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** SWWPVB-B-U2 - Service Water Valve Box Return to Wet Pit, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** SWWPVB-B-U2 - Service Water Valve Box Return to Wet Pit, Train B  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled and watertight barriers exist between divisions; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	SWWPVB-B-U2 - Service Water Valve Box Return to Wet Pit, Train B	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

**Engineering Evaluation ID** SM-C051326701-006 Identify Regulatory Fire Barriers

**Inactive** No

**Functionally Equivalent** No

**Adequate for the Hazard** Yes

**Summary** Purpose:

This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.

Bases for Acceptability:

- The fire areas, fire zones and rooms on both sides of the barrier were identified,
- The construction of the boundary and the potential issue with the element in question was described,
- The fire hazards and fire protection features impacting the barrier were described,
- Elements with construction features equal to 3-hr boundaries were credited as such,
- The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.

## Fire Safety Analysis

<b>Fire Area ID:</b>	SWWPVB-B-U2 - Service Water Valve Box Return to Wet Pit, Train B	<b>Previously Approved Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Licensing Action</b>	Appendix R Exemption (No. 1-13), Unit 1 and 2 Service Water Valve Box (Fire Area SWGA (New: SWWPVB-A and SWWPVB-B) , lack of separation of cables and equipment and associated non-safety circuits of redundant trains by a fire barrier having a 3-hour rating (III.G.2.a criteria)	
<b>Licensing Basis</b>	<p>Exemption request per 03/13/1985 APC letter to the NRC provide the following justification for the lack of 3 hour fire-rated barrier separating redundant trains, which was approved by the NRC in a letter dated 11/19/1985:</p> <ul style="list-style-type: none"><li>• Low in situ combustibles</li><li>• 3 ft thick reinforced concrete barrier, with 1 sealed penetration</li><li>• Effects of exposure fire could cause equipment to become electrically inoperative, but would not change from its required position, thus neither redundant trains of service water would be rendered inoperative.</li></ul> <p>This exemption is no longer required because the subject boundaries have been demonstrated adequate for the hazard in existing engineering equivalency evaluation(s).</p>

<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 24, 2007 Edition. The approach was to determine the applicable code edition for private fire service mains, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Private fire service mains were determined to be compliant with the relevant sections of NFPA-24-2007, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the FNP code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006	Identify Regulatory Fire Barriers
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li><li>• The construction of the boundary and the potential issue with the element in question was described,</li><li>• The fire hazards and fire protection features impacting the barrier were described,</li><li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li><li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li></ul>

## Fire Safety Analysis

**Fire Area ID:** YARD-SWIS-U2 - Yard Area in Vicinity of SWIS  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump or swing charging pump via Train A power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump or swing charging pump via Train A power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump or swing charging pump via Train A power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** YARD-SWIS-U2 - Yard Area in Vicinity of SWIS  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A service water is provided with two service water pumps in service recirculating to the pond or Train A service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with performance-based approach HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

**Fire Area ID:** YARD-U1 - Yard Area in Main Power Block  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, a letdown isolation valve, or a letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A PORV, Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump and TDAFW pump supplying Steam Generator 1A/1B/1C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, and RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 1A/1B/1C pressure is monitored. 6. SG Level - Steam Generator 1A/1B/1C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** YARD-U1 - Yard Area in Main Power Block  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Performance-based approach electrical power is supplied by off-site power via SUT 1A/SUT 1B, diesel generator EDG1-2A/EDG-1B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	YARD-U1 - Yard Area in Main Power Block	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment H	Code Compliance Evaluation for NFPA 20, 2007 Edition, Stationary Pumps for Fire Protection
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 20, 2007 Edition. The approach was to determine the applicable code edition for stationary pumps for fire protection, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Stationary pumps for fire protection were determined to be compliant with the relevant sections of NFPA-20-2007, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment I	Code Compliance Evaluation for NFPA 22, 2008 Edition, Water Tanks for Private Fire Protection
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 22, 2008 Edition. The approach was to determine the applicable code edition for water tanks for private fire protection, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Water tanks for private fire protection were determined to be compliant with the relevant sections of NFPA-22-2008, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix C, which vetted the 2008 edition non-compliances against the FNP code of record edition of 1970.</li><li>• All other non-compliances have been provided with justifications.</li></ul>

<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment J Code Compliance Evaluation for NFPA 24, 2007 Edition, Private Fire Service Mains	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 24, 2007 Edition. The approach was to determine the applicable code edition for private fire service mains, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Private fire service mains were determined to be compliant with the relevant sections of NFPA-24-2007, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the FNP code of record edition of 1973.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment K Code Compliance Evaluation for NFPA 30, 2008 Edition, Flammable and Combustible Liquids Code	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 30, 2008 Edition. The approach was to determine the applicable code edition for flammable &amp; combustible liquids, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Flammable and combustible liquids were determined to be compliant with the relevant sections of NFPA-30-2008, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were resolved in Appendix D, which vetted the 2008 edition non-compliances against the FNP code of record edition of 1972.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	YARD-U1 - Yard Area in Main Power Block	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment L Code Compliance Evaluation for NFPA 55, 2005 Edition, Storage, Use and Handling of Compressed Gases and Cryogenic Fluids	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 55, 2005 Edition. NFPA 805 references NFPA 50B for liquefied hydrogen systems; this standard has been superseded by NFPA 55, in which the liquefied hydrogen requirements primarily reside in Chapter 11. The approach was to determine the applicable code edition for the applicable systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code.</li> <li>• The liquefied hydrogen system was determined to be compliant with the relevant sections of NFPA-55-2005, with the exception of the non-compliances identified in Table 6-1 of the report.</li> <li>• All non-compliances have been provided with justifications or actions have been initiated to make modifications to bring the element into compliance.</li> </ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** YARD-U2 - Yard Area in Main Power Block  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
1 Primary Control Station	Plant shutdown is performed from the Control Room.	
2.1 Reactivity Control - Reactor Trip	Reactor is manually tripped from the Control Room.	
2.2 Reactivity Control - Maintain Subcritical Conditions	Subcritical conditions are maintained by isolating the VCT to prevent boron dilution and by charging borated water from the RWST using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power.	
3.1 RCS Inventory Control - RCS Makeup	RCS inventory is controlled using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power aligned to the RWST.	
3.2 RCS Inventory Control - Isolate Leakage Paths	Normal letdown is isolated using orifice isolation valves, letdown isolation valve or letdown path containment isolation valve. Excess letdown is isolated using one or more excess letdown or containment isolation valves. PZR PORV leakage paths are isolated using Train A PORV and Train B PORV. The RCS to RHR high/low pressure interface is isolated using the Train A/Train B RHR inboard isolation valve and Train A/Train B RHR outboard isolation valve.	
3.3 RCS Inventory Control - RCP Seal Integrity	Maintain RCP Seal Integrity - RCP seal integrity is maintained by tripping all RCPs, maintaining normal seal injection using Train A charging pump, Train B charging pump or swing charging pump via Train A/Train B power, and preventing failure of the RCP thermal barriers. RCP seal injection paths are secured by isolating the supply and discharge seal injection lines. CCW to RCP thermal barriers are isolated using containment isolation valves or the CCW to RCP thermal barrier isolation valve.	
4.1 RCS Pressure Control - Pressure Transient	Undesired depressurization due to inadvertent spray is prevented by ensuring auxiliary spray valve remains closed and the Loop 1 and Loop 2 RCPs are shut off. Undesired pressure increase is prevented by deenergizing all pressurizer heater groups.	
4.2 RCS Pressure Control - Positive Pressure Control	Positive control of RCS pressure is accomplished with Train A/Train B PORV or aux spray for pressure reduction and Pressurizer Heater Group A/B for pressure increase.	
5 Decay Heat Removal	Decay heat removal during HSD is accomplished using Train A MDAFW pump, Train B MDAFW pump or TDAFW pump supplying Steam Generator 2A/2B/2C. Main feed is isolated to prevent uncontrolled cooldown.	
6 Process Monitoring	1. Shutdown Margin - Shutdown margin is monitored by source range detector Ch 1/Ch 2. 2. RCS Pressure - RCS pressure is monitored by PZR narrow range Ch 1/Ch 2/Ch 3, PZR non-safety channel, RCS wide range pressure for Loop 1/Loop 3. 3. Pressurizer Level - Pressurizer level is monitored by PZR level Ch 1/Ch 2/Ch 3. 4. RCS Temperature - RCS Loop 1/Loop 2/Loop 3 temperature is monitored by loop hot and cold leg RTDs. 5. SG Pressure - Steam Generator 2A/2B/2C pressure is monitored. 6. SG Level - Steam Generator 2A/2B/2C level is monitored.	

## Fire Safety Analysis

**Fire Area ID:** YARD-U2 - Yard Area in Main Power Block  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

**Nuclear Safety Performance Goals**

Performance Goal	Method of Accomplishment	Comments
7.1 Vital Auxiliaries – Electrical	1. Performance-based approach electrical power is supplied by off-site power via SUT 2A/SUT 2B, diesel generator EDG1-2A/EDG-2B. 2. 4.16 kV and 600 V power is supplied by Train A/Train B distribution equipment. 3. 125 VDC power and 120 VAC power is supplied by Train A/Train B equipment.	
7.2 Vital Auxiliaries – Service Water	Performance-based approach Train A/Train B service water is provided with two service water pumps in service recirculating to the pond or Train A/Train B service water is provided with one service water pump in service recirculating to the pond and non-essential turbine building loads isolated.	
7.3 Vital Auxiliaries – Component Cooling Water	Train A/Train B component cooling water is provided with non-essential loads isolated.	
7.4 Vital Auxiliaries – HVAC	Control Room cooling is provided by Train A/Train B HVAC. Room cooling at essential locations is provided with HVAC equipment corresponding to the service water train.	

### Fire Suppression Activities Effect on Nuclear Safety Performance Criteria

Safe and stable conditions can be achieved and maintained utilizing equipment and cables outside of the area of fire suppression activity. No automatic suppression is installed in this area. Discharge of manual suppression water to adjacent compartments is controlled; therefore, fire suppression activities will not adversely affect the plant's ability to achieve the nuclear safety performance criteria.

## Fire Safety Analysis

<b>Fire Area ID:</b>	YARD-U2 - Yard Area in Main Power Block	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	

<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment H	Code Compliance Evaluation for NFPA 20, 2007 Edition, Stationary Pumps for Fire Protection
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 20, 2007 Edition. The approach was to determine the applicable code edition for stationary pumps for fire protection, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"><li>• An applicability determination was completed to identify the relevant sections of the code</li><li>• Stationary pumps for fire protection were determined to be compliant with the relevant sections of NFPA-20-2007, with the exception of the non-compliances identified in Table 6-1 of the report</li><li>• Some non-compliances in Table 6-1 were closed in Appendix D, which vetted the 2007 edition non-compliances against the FNP code of record edition of 1974.</li><li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li></ul>	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment I	Code Compliance Evaluation for NFPA 22, 2008 Edition, Water Tanks for Private Fire Protection
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 22, 2008 Edition. <b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment K Code Compliance Evaluation for NFPA 30, 2008 Edition, Flammable and Combustible Liquids Code	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 30, 2008 Edition. The approach was to determine the applicable code edition for flammable &amp; combustible liquids, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code</li> <li>• Flammable and combustible liquids were determined to be compliant with the relevant sections of NFPA-30-2008, with the exception of the non-compliances identified in Table 6-1 of the report</li> <li>• Some non-compliances in Table 6-1 were resolved in Appendix D, which vetted the 2008 edition non-compliances against the FNP code of record edition of 1972.</li> <li>• All other non-compliances have either been provided with justifications, or SNC has initiated actions to make document revisions and/or modifications to bring the element into compliance.</li> </ul>	

## Fire Safety Analysis

<b>Fire Area ID:</b>	YARD-U2 - Yard Area in Main Power Block	<b>Engineering Evaluations</b>
<b>Compliance Basis:</b>	NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions	
<b>Engineering Evaluation ID</b>	ENGDOC, SM-C051326701-007, Attachment L Code Compliance Evaluation for NFPA 55, 2005 Edition, Storage, Use and Handling of Compressed Gases and Cryogenic Fluids	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	Yes	
<b>Adequate for the Hazard</b>	No	
<b>Summary</b>	<p>Purpose:</p> <p>This evaluation was conducted to determine the current level of compliance with the applicable requirements of NFPA 55, 2005 Edition. NFPA 805 references NFPA 50B for liquefied hydrogen systems; this standard has been superseded by NFPA 55, in which the liquefied hydrogen requirements primarily reside in Chapter 11. The approach was to determine the applicable code edition for the applicable systems, identify applicable sections of the code requiring verification, and perform those verifications.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• An applicability determination was completed to identify the relevant sections of the code.</li> <li>• The liquefied hydrogen system was determined to be compliant with the relevant sections of NFPA-55-2005, with the exception of the non-compliances identified in Table 6-1 of the report.</li> <li>• All non-compliances have been provided with justifications or actions have been initiated to make modifications to bring the element into compliance.</li> </ul>	
<b>Engineering Evaluation ID</b>	SM-C051326701-006 Identify Regulatory Fire Barriers	
<b>Inactive</b>	No	
<b>Functionally Equivalent</b>	No	
<b>Adequate for the Hazard</b>	Yes	
<b>Summary</b>	<p>Purpose:</p> <p>This report includes engineering equivalency evaluations for several fire area boundaries in Units 1 and 2 power block buildings, as well as the shared areas such as SWIS, RWIS and the Diesel Generator Building. The approach was to examine any boundary for which there was not a documented/credited 3-hr rated barrier. Evaluations were also included non-rated reach rod penetrations and separation between pressure sensing lines.</p> <p>Bases for Acceptability:</p> <ul style="list-style-type: none"> <li>• The fire areas, fire zones and rooms on both sides of the barrier were identified,</li> <li>• The construction of the boundary and the potential issue with the element in question was described,</li> <li>• The fire hazards and fire protection features impacting the barrier were described,</li> <li>• Elements with construction features equal to 3-hr boundaries were credited as such,</li> <li>• The evaluation demonstrates that elements with construction features not equivalent to 3-hr rated boundaries are adequate for the hazard.</li> </ul>

## Fire Safety Analysis

**Fire Area ID:** YARD-U2 - Yard Area in Main Power Block  
**Compliance Basis:** NFPA 805, Section 4.2.4.2 Performance-Based Approach - Fire Risk Evaluation with simplifying deterministic assumptions

### Required Systems and Features

Fire Zone ID	Description	Required Suppression System	Required Detection System	Required Fire Protection Feature	Required Fire Protection Feature and System Details
					-- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-S-NA/OUTSIDE-2-SVB3-B/YARD-155: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-S-NA/OUTSIDE-2-SVB4-B/YARD-155: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-S-STAIR 1/OUTSIDE-S01/YARD-175: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-S-STAIR 2/OUTSIDE-S02/YARD-83: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2101/OUTSIDE-1/YARD-83: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2103/OUTSIDE-1/YARD-83: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2107/OUTSIDE-90/YARD-83: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2108/OUTSIDE-1/YARD-83: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2119/OUTSIDE-1/YARD-83: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2128/OUTSIDE-1/YARD-83: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2151/OUTSIDE-4/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2165/OUTSIDE-4/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2166/OUTSIDE-4/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2185/OUTSIDE-6/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2190/OUTSIDE-6/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2191/OUTSIDE-6/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2192/OUTSIDE-6/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2195/OUTSIDE-6/YARD-100: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2195/OUTSIDE-6/YARD-139: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2195/OUTSIDE-6/YARD-155: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2196/OUTSIDE-1/YARD-105: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2196/OUTSIDE-1/YARD-129: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2196/OUTSIDE-1/YARD-139: -- Barrier: Required to support a fire area boundary evaluation. FireBarrier, U2-FNP-W-2196/OUTSIDE-1/YARD-155: -- Barrier: Required to support a fire area boundary evaluation.

**G. RADIOACTIVE RELEASE RESULTS**

This Appendix previously provided a summary of the Radioactive Release results documented in calculation SM-C051326701-010, NFPA 805 Radiological Release Calculation. However, since this calculation is an active, controlled document, maintaining a copy of the same information in this DBD (also a controlled document) was not necessary. Therefore, the summary results have been deleted from this attachment.

For a current version of the Radioactive Release evaluation and results, see calculation SM-C051326701-010.
