P R O C E E D I N G S

8:34 a.m.

CHAIRMAN SUNSERI: The meeting will now come to order.

This is the second day of the 691st meeting of the Advisory Committee on Reactor Safeguards. I'm Matthew Sunseri, the Chair of the ACRS.

Members in attendance are Dave Petti, Ron Ballinger, Greg Halnon, Vicki Bier, Joy Rempe, Walt Kirchner, Dennis Bley.

Let me ask, is Vesna Dimitrijevic on the line yet?

(No response.)

We expect Vesna to be joining remotely.

And Steve Schultz, our consultant, is also in the room with us.

There is an accident out on the highway that's preventing some members from getting here. Charles Brown will be here as soon as he is safely able to do so, and Scott Moore, our Executive Director, and Elisha Ballinger (phonetic) are also in traffic trying to get here.

The Designated Federal Officer for this meeting is Ms. Zena Abdullahi.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

www.nealrgross.com

1 During today's meeting, the Committee will
2 consider the following:

3 The first topic is the Research
4 Information Letter on Fuel Fragmentation, Relocation,
5 and Dispersal During LOCA. This will be a
6 presentation followed by report preparation by the
7 Committee.

8 Secondly, we will continue with the report
9 preparation on Draft Guide 5061, which deals with
10 Cyber Security.

11 A phone bridge line has been opened to
12 allow members of the public to listen in on the
13 presentations and Committee discussions. We have
14 received no written comments or requests to make oral
15 statements from members of the public regarding
16 today's session.

17 There will be an opportunity for public
18 comment. We have set aside time in the agenda for
19 comments from members of the public attending or
20 listening to our meetings. Written comments may also
21 be forwarded to Ms. Zena Abdullahi, the Designated
22 Federal Officer.

23 A transcript of the open portion of the
24 meeting is being kept. It is requested that speakers
25 identify themselves and speak with sufficient clarity

1 and volume, so they can be readily heard.
2 Additionally, participants should mute themselves when
3 not speaking.

4 And just as a note to our agenda topic,
5 Research Biennial Review is schedule for 1:00 to 2:30
6 today, but that topic has been taken off the agenda
7 because we completed that work at our last full
8 Committee meeting. So, we will redirect that time
9 allotted for that topic to report preparation.

10 All right. This is the second day of our
11 use of what we'll call hybrid meeting format. And
12 yesterday was really, really a good experience. I
13 think we had a very good meeting. We effectively
14 demonstrated how to use this technology, but we did
15 learn some things. So, let me just cover a couple of
16 highlights from yesterday.

17 First off, for the speakers around the
18 table here, it is very difficult to hear you talk in
19 the room. Ironically, if you're outside of this room,
20 you're crystal clear. All right?

21 (Laughter.)

22 So, what we're going to ask you to do --
23 and we're working on the issue; in fact, there will be
24 some technicians behind the scenes trying to adjust
25 the gain on these microphones today. They need the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 full room in place to do that and the dynamics. It's
2 a balancing act between these mics and the feedback of
3 the main system. So, we do acknowledge that problem.
4 We do acknowledge that it's being worked on, and we
5 appreciate your patience as we work through that.

6 However, what I'm going to ask you to do
7 as the speakers around the table, to not only use your
8 mic here, but use your playground voices if you're
9 talking to the other kids out on the playground to
10 help us hear you until we get this fixed. All right?

11 The second thing is, I had asked all
12 participants in the room and remotely to provide
13 feedback to us, and I did get some feedback yesterday
14 from remote presenters that said, you know, they were
15 getting static or sounds of people not muting their
16 microphones, or whatever. And as it turns out, that's
17 a problem with the room microphone setup. They're
18 shuffling the papers or people are getting up and
19 moving around. These speakers are very sensitive and
20 may pick that up, and it's a distraction to the people
21 speaking remotely.

22 So, I'm going to be aware of that, and if
23 I see jostling in here, I can mute the system and cut
24 that out. We will still be able to hear them, but
25 they won't be able to hear us.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 But what I'm going to ask you to do is
2 let's try to minimize that distraction. And, also, as
3 a reminder, since the speakers are on all the time,
4 when you see this green light on, anything, any
5 background noise, any sidebar conversations are being
6 picked up. All right. So, just be aware that there
7 is an open mic as long as this green light up here is
8 on. All right?

9 So, I think that is it. Anybody else have
10 anything they want to share as far as lessons learned
11 from yesterday's hybrid?

12 We did fix the lights in the room.

13 MEMBER BLEY: Kudos to all who made that
14 happen. There was a temporary fix yesterday, but
15 until Maintenance comes back and puts the bulbs in, we
16 should be okay.

17 CHAIRMAN SUNSERI: Yes, our great staff
18 did a wonderful job of responding.

19 One last thing, you'll note in the room up
20 here there's this display over the main console that
21 says, "Open Right Now." That's a designation of what
22 type of meeting we are in. So, we are in an open
23 session right now. When we go to closed session, that
24 will be change to "Closed." All right? And the
25 alternation between the session and the time, if you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 don't like the alternating, we can stop the time and
2 we can adjust that display. But I think it's fine the
3 way it is.

4 All right. Anything else?

5 (No response.)

6 Thank you. We will now get started with
7 the first topic, and I'll turn to Member Ron Ballinger
8 for opening remarks or introductions of the Research
9 Information Letter topic.

10 MEMBER BALLINGER: Thank you, Mr.
11 Chairman.

12 Today's meeting will be a summary, I
13 believe -- actually, an expanded summary in some cases
14 -- of the Subcommittee meeting that we had on November
15 the 17th, at which point we had a fairly spirited
16 discussion of the topic and we had some spirited
17 comments from stakeholders; namely, NEI.

18 So, today's presentation, we will have a
19 presentation from the staff first, and then, NEI has
20 asked for time for a presentation. So, they will give
21 a presentation after the staff.

22 And so, with that, I think, is it
23 Michelle?

24 VICE CHAIRMAN REMPE: Ron, if you don't
25 mind, I need to interrupt for just a minute?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 MEMBER BALLINGER: You can interrupt,
2 anything you want.

3 VICE CHAIRMAN REMPE: Oh, you're so kind.

4 Okay. I need to just state that I'm going
5 to have to limit my participation in some of this
6 discussion because of what might be perceived as a
7 conflict of interest on this topic. And I need to put
8 that on the record, and thank you.

9 MEMBER BALLINGER: And I add that's not an
10 advantage.

11 (Laughter.)

12 So, who is going to do the presentation?
13 Okay, Kim, the floor is yours.

14 MS. WEBBER: Okay. Good morning, Chair
15 Sunseri and Subcommittee Chair Ballinger. It's a real
16 pleasure to be in this room with you today rather than
17 in a separate or at our homes, in the offices. So,
18 I'm glad that we're part of the inaugural ACRS
19 meetings back in this room. It's really a great
20 chance to see all of you in person.

21 MEMBER BALLINGER: Yes, but I don't know
22 what kind of an advantage that is.

23 (Laughter.)

24 MS. WEBBER: My name is Kim Webber. I'm
25 the Director of the Division of Systems Analysis in

1 the Office of Nuclear Regulatory Research.

2 On November 17, the staff briefed the
3 Metallurgy and Reactor Fuel Subcommittee on the
4 Research Information Letter, or FIL, related to Fuel
5 Fragmentation, Relocation, and Dispersal, or FFRD. We
6 are pleased to brief the rest of the ACRS members
7 today on this important topic.

8 As you know, industry is very interested
9 in pursuing licensing of current fuel designs to
10 higher burnups. Under conditions described in the RIL
11 which include high burnup, FFRD has been observed.
12 And understanding of the mechanisms that lead to FFRD
13 represents one part of a larger analysis to evaluate
14 the safety of reactor operations using high burnup
15 fuel.

16 As you know, an assessment of the
17 thermohydraulic behavior of the reactor coolant under
18 loss of coolant accident, or LOCA, conditions and the
19 consequences of any potential fuel dispersal following
20 a LOCA are two other really important parts of the
21 safety analysis.

22 The purpose of the RIL is to document and
23 communicate to NRR the research that exists to date on
24 the mechanisms of FFRD, and it provides insights
25 regarding the basis for the empirical limits. It does

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 not include a LOCA analysis or an assessment of the
2 consequence of the potential for fuel dispersal into
3 the coolant.

4 In the past, RILs have been used to
5 support the development of regulatory guidance. In
6 this case, the determination to develop that
7 regulatory guidance, or any guidance associated with
8 high burnup or FFRD, lies with NRR. My staff have
9 been working very close with their NRR counterparts,
10 and we do have staff from NRR in the audience today.
11 So, they've discussed the body of research that is
12 currently available, and they continue to monitor the
13 research activities, and through their involvement in
14 many of the different international programs involving
15 high burnup.

16 So, unless there's any questions, I'd like
17 to turn the presentation over to Michelle Bales.

18 MS. BALES: Thank you, Kim.

19 My name is Michelle Bales. I work in the
20 Office of Research, and I will be presenting, along
21 with my colleague Lucas Kyriazidis, the Research
22 Information Letter 2113.

23 Next slide.

24 CHAIRMAN SUNSERI: Yes, and if you could
25 bring this (referring to the microphone) as close to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 you.

2 MS. BALES: Okay.

3 CHAIRMAN SUNSERI: It's got a little bit
4 of a cord. You can bring it a little closer.

5 MS. BALES: Is that better?

6 CHAIRMAN SUNSERI: Yes.

7 MS. BALES: Okay.

8 CHAIRMAN SUNSERI: But turn it on.

9 (Laughter.)

10 MS. BALES: Oh, man, this thing is very
11 sensitive.

12 CHAIRMAN SUNSERI: It's sensitive.

13 MS. BALES: Can you touch anywhere to --

14 CHAIRMAN SUNSERI: The green light, or red
15 light.

16 MS. BALES: There.

17 CHAIRMAN SUNSERI: There. Thank you.

18 MS. BALES: Hopefully, that will be the
19 biggest stumbling block here.

20 CHAIRMAN SUNSERI: Hopefully, yes.

21 (Laughter.)

22 MS. BALES: Okay. So, the presentation
23 today will start with history of FFRD. I'll go into
24 programs that are cited in the RIL, as well as the
25 peer review process that we used. I'll speak to the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 outcome of the RIL; in other words, how the RIL could
2 be used, and then, dive into the basis for the
3 empirical limits, and then, finish with some other
4 matters.

5 So, first, the history.

6 I actually want to warn Kim there is a lot
7 of animation here. So, I might be telling you to
8 click again.

9 MS. WEBBER: Yes.

10 MS. BALES: So, this is the slide,
11 correct?

12 Our Research Information Letters have been
13 used for a variety of purposes. I want to spend just
14 one minute explaining why we chose a Research
15 Information Letter for this set of information.

16 They're a tool, and as our public website
17 explains, they are a tool that is used for internal
18 communication from the Office of Research to a
19 licensing office to provide a concise summary that
20 makes it easier for the regulatory offices to process
21 and utilize complex information. That seemed to fit
22 the mold in this case.

23 If you would go to click one more time?

24 In addition, in the fuels area, RILS have
25 been used a couple of times. First, in 2004, there

1 was a RIL written to summarize a large body of
2 research relating to reactivity-initiated accidents.
3 And then, in 2008, there was a RIL written for the
4 large radio research on cladding embrittlement under
5 LOCA conditions. In both cases, guidance for proposed
6 rulemaking followed.

7 And if you click one more time? Right.

8 The RIL, as I said, there's a lot of
9 information that is summarized in the RIL. It's broad
10 in scope. It's difficult to understand the
11 experiments on their face value, and it would be very
12 time-consuming to digest all of it. So, all of the
13 images sort of just represent the complexity of the
14 information that is presented.

15 And one more click.

16 MEMBER HALNON: Michelle, why not a NUREG
17 or something to that effect that is a report and a
18 process more attuned to passing complex information?

19 MS. BALES: I think a NUREG certainly
20 would have been an acceptable choice. A Research
21 Information Letter is a particular tool to communicate
22 the regulatory context to a program office or to a
23 licensing office. So, it seemed to fit in this case.

24 They've been used for a variety of
25 applications the same way NUREGs have. To be honest,

1 I think some of it came from the fact that they have
2 been used in the fuels area in the past, as I
3 mentioned, in 2004 and 2008.

4 MEMBER BALLINGER: For one reason or
5 another, I don't have this presentation. Does
6 everybody else have it?

7 MS. BALES: There are three new slides
8 relative to the Subcommittee presentation. So, this
9 is one of them. During the Subcommittee discussion,
10 there were some questions, I think, about what a RIL
11 was and why it was chosen. So, I added this slide to
12 help that discussion.

13 MEMBER BALLINGER: Can we make sure that
14 Zena gets a copy of this?

15 MS. BALES: Absolutely, yes.

16 MEMBER BALLINGER: And I have a question.
17 Normally, Research does work in response to a user
18 need.

19 MS. BALES: Uh-hum.

20 MEMBER BALLINGER: And I've asked for the
21 user need, but we haven't got it. Is there a user
22 need for this? And if there is one, can we get it?

23 MS. BALES: Okay. So, Research often does
24 work in response to user needs, but it's not the only
25 occasion that research is conducted. In the case of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 the information that's contained in the RIL, the SCIP,
2 Cladding Integrity Program, for example, it is not
3 mentioned in a user need. We participated in that
4 program, that international joint project, as part of
5 the research -- what do you call it? I guess it's
6 just a research plan, but it's, in general, the Office
7 of Research participates in a lot of international
8 programs outside of specific user need requests.

9 Having said that, as we got further along,
10 and particularly, in preparation for high burnup
11 applications, there was a user need created for high
12 burnup issues specifically, and the RIL was mentioned
13 as a tool to support that effort. And so, there is a
14 user need that we can provide which identifies the
15 Research Information Letter.

16 MEMBER BALLINGER: That would be great.

17 MS. BALES: I just want to say that the
18 body of work that it refers to itself is not any user
19 need. Our participation in this program was a
20 commitment that Research made outside of that.

21 MEMBER HALNON: But is the RIL a public
22 document?

23 MS. BALES: Yes, RILS are public
24 documents.

25 MEMBER HALNON: Okay. Real time? I mean,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 I guess what I'm asking is, is it issued, and then,
2 the industry gets it real time, as opposed to a year
3 or two down the road after it's digested by the NRR?

4 MS. BALES: So, right now, a copy of the
5 Research Information Letter is available in draft to
6 support this meeting, because it's a public meeting
7 and all of the materials for ACRS meetings are public.
8 Once it's signed and concurred on, and transmitted
9 officially from the Office of Research to NRR, it is
10 public that moment. There's no digestion period from
11 the program office.

12 MEMBER HALNON: So, when it gets through
13 the process?

14 MEMBER BLEY: I think you can also get a
15 RIL out much quicker than a NUREG, I believe. And
16 there was something of a sense of urgency in getting
17 this out, I think, from what you talked about at
18 Subcommittee.

19 MS. BALES: Yes, there's high burnup
20 applications that are coming in through the licensing
21 office right now. And we wanted to put information in
22 the staff's hands that would allow them to review that
23 information in the context of what we know about these
24 phenomenon. And so, we wanted to make that available
25 as soon as possible.

1 MEMBER BLEY: And I'm going to say this a
2 little wrong, but it strikes me from what I heard at
3 this Subcommittee there's a lot of knowledge gaps
4 remaining here. And I guess having this in the hands
5 of NRR is important, so that they know what went on
6 and what we don't know before they have to decide on
7 an application.

8 MS. BALES: Yes.

9 MEMBER BLEY: I mean, I assume that's
10 what's driving that.

11 MS. BALES: Yes, and I also want to say
12 that this is all public information. So, there could
13 be proprietary information that would supplement this,
14 and it could appear in a license application. So,
15 even the gaps that are existing in the RIL may be
16 filled with nonpublic information, and that would be
17 something that the licensing office would have access
18 to, once an application actually came in. I'm not
19 saying that that exists, but just to point out that
20 the RIL only refers to data that is public, and a
21 large amount of it, we actually requested to be made
22 public for the publication.

23 MEMBER BLEY: Okay. Thanks. That helps
24 me.

25 VICE CHAIRMAN REMPE: So, just for

1 information purposes, on the user need, could you
2 elaborate what they said they would do with the RIL?
3 What would be the next step? Because I would like to
4 better understand what this would lead to, what their
5 intent is.

6 MS. BALES: So, that is, unfortunately,
7 not identified in the user need. The user need just
8 says what products the Office of Research will
9 produce. It doesn't define the next steps.

10 VICE CHAIRMAN REMPE: What's typically
11 then?

12 MS. BALES: It varies. It sometimes can
13 be a Regulatory Guide. So, I'll say in the case of
14 04-01, regulatory guidance was updated, because the
15 limits for RAA are located in regulatory guidance. In
16 the case of 08-01, a proposed rulemaking was initiated
17 because the findings in 08-01 called into question
18 50.46 criteria. So, it really depends on what the
19 conclusions of the research are.

20 FFRD is currently not addressed in
21 guidance, and it's currently not explicitly identified
22 in regulations. And so, it's not obvious that either
23 of those actions would be required as a prompt from
24 this.

25 MEMBER BALLINGER: Did 08-01 result in

1 NUREG-2240, whatever the number is? The last version
2 of fuel, that described fuel dispersal and
3 fragmentation?

4 MS. BALES: So, let me go to the next
5 slide because the last point on here is just to say
6 that Research Information Letters do not provide
7 guidance, and I think we've kind of covered that. I
8 don't want to forget to mention it, though.

9 As we go to the next slide, NUREG-2121 is
10 a literature review that the staff produced. Okay.
11 So, I start with 08-01. I mentioned that its primary
12 purpose was to establish new embrittlement criteria
13 relative to 50.46 rulemaking. At that time, we
14 already had seen the first example of fuel dispersal
15 in a test that had taken place at Halden on a rod that
16 was 92 gigawatt days, far above the license burnup
17 limits. Because we had that information in RIL 08-01,
18 we identified dispersal as a potential issue and said
19 that we would continue working on it. So, RIL 08-01
20 will mention it.

21 Following that RIL, there were additional
22 tests that were run, and it really prompted the staff
23 to go and do a literature review and see, for 90 tests
24 in over 30 years, what have we ever observed with
25 respect to fragmentation, relocation, and dispersal?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1 NUREG-2121 is, basically, a literature
2 review, and it reviews the past information. And the
3 conclusion drawn at the end of that review was that
4 fragmentation, relocation, and dispersal could not be
5 excluded, and that, at the time, the current burnup
6 limits were likely to prevent significant dispersal,
7 and therefore, there was no safety concern at that
8 time.

9 Additional research became available, and
10 in 2015, the staff also conducted an analysis that
11 looked at thermohydraulic conditions typical for
12 specific power histories and operating regimes and did
13 an analysis to determine how much fuel dispersal might
14 be expected in a nominal LOCA condition. And that
15 SECY-15-0148 concluded that, again, current licensing
16 limits were sufficient to prevent significant
17 dispersal. But, even in that SECY, we acknowledged
18 that that conclusion was heavily reliant on the
19 assumptions about burnup limits and how high burnup
20 fuel was operated; specifically, whether high burnup
21 fuel was located in low power regimes and, basically,
22 experienced a more benign LOCA because of its low
23 power.

24 And then, finally, now -- one more click
25 -- we have the Research Information Letter, which is

1 sort of a continuation of these documents and says
2 everything that we know as of today.

3 MEMBER BALLINGER: Do we know what the
4 status of 50.46(c) is?

5 MS. BALES: It is still up with the
6 Commission for a decision.

7 Okay. So now, I want to get into the
8 programs that are cited in the RIL and the peer review
9 process. The main thing I want to communicate about
10 the data sources is that we learned a lot since 2015,
11 when the staff last wrote about FFRD. The Studsvik
12 Cladding Integrity Program, Phase III, was conducted
13 completely after the 2015 SECY. Oak Ridge ran a small
14 hot cell program that added a few additional tests,
15 and one or two Halden tests were conducted after 2015.

16 The size of the circles represents the
17 number of tests, and the transparency of each circle
18 represents whether that information was publicly
19 available. So, prior to the RIL, the SCIP-III data
20 was not publicly available, and this RIL represents
21 the first time that this team disseminated. The Oak
22 Ridge and NRC LOCA tests were documented in public
23 journals and NUREGs.

24 On the next slide.

25 Because the data coming out of these

1 programs is relatively new and there is not a full
2 mechanistic understanding of the phenomenon, we wanted
3 to do a purity process. It's not a requirement for a
4 Research Information Letter, but we chose to do it
5 because we were committed to having outside opinion
6 and ensuring that we hadn't missed research that was
7 relevant, and that the basis for our conclusions in
8 the RIL were well supported.

9 So, we identified five individuals who
10 already had extensive familiarity with FFRD research,
11 either because they are conducting research themselves
12 or through their participation in programs like SCIP
13 and Halden. So, the names are listed here and a
14 little bit about their background.

15 Going on to the next slide, I want to now
16 talk about the outcome of the RIL. And again, I'm
17 talking about how the RIL could be used, before I talk
18 about the specific basis for each limit.

19 And as I talk about that, I want to
20 explain a little bit about the testing that forms the
21 basis for the RIL, because understanding how the tests
22 were conducted is going to be important for
23 understanding some of the conclusions that we drew.

24 And I'm wondering if, because I have added
25 so much animation and when I'm presenting it's

1 convenient to do that, I wonder if I could just --
2 thank you. I don't want to cause a distraction.

3 But the testing that was done, almost
4 exclusively, except for Halden, all of the other three
5 programs that we cite in the RIL were tested on
6 prototypic irradiated fuel, irradiated in a commercial
7 reactor, typical fuel and cladding materials, but the
8 tests were conducted in a hot cell. The heat was
9 provided with a clamshell furnace. So, in the image
10 on the lower left, you see the furnace open, and the
11 orange square is encircling the fuel rod, a single
12 fuel rod. And there are four heating elements that
13 surround the fuel rod when the clamshell furnace is
14 closed.

15 MEMBER BALLINGER: So, I have experience
16 with this kind of experiment, with quad-elliptic
17 furnaces. And is this plot an average of
18 temperatures? Is there a detailed report that shows
19 the individual temperatures around the fuel rod during
20 the test? Is this an average?

21 MS. BALES: The plot that's shown on the
22 lower right is the thermocouple that was used to
23 control the furnace. So, it's located just above the
24 center. And prior to the testing, there was an
25 extensive qualification program done by Studsvik about

1 the furnace. And in that report, you can find
2 discussion of the circumferential variation, the axial
3 variation.

4 MEMBER BALLINGER: So, there is a
5 quantification of the uncertainty?

6 MS. BALES: Yes.

7 MEMBER BALLINGER: Do you know what it
8 was?

9 MS. BALES: You mean the uncertainty in
10 the temperature at that location or --

11 MEMBER BALLINGER: Every 15 degrees sees
12 a factor of two. So, it doesn't take much.

13 MS. BALES: Yes. So, when we're looking
14 at oxidation, it is very important; small deviations
15 can have a huge impact on oxidation, especially as you
16 get to high temperature.

17 For the phenomenon that we're looking at
18 here, 15 degrees plus or minus, so basically, when
19 burst occurs and what the peak temperature is, I don't
20 think it's as significant as if you're looking at the
21 oxidation.

22 MEMBER BALLINGER: These tubes have a
23 helical texture.

24 MS. BALES: Uh-hum.

25 MEMBER BALLINGER: Which means the

1 strength of the creep resistance is a function of
2 where you are on the fuel rod. And in that case, the
3 creep rate and the interaction between the creep rate
4 and the time of the test can make a difference as to
5 where the burst begins. So, has anybody done a look,
6 a careful look, at that?

7 MS. BALES: The microstructure is
8 hexagonal close-packed, and they are non -- I'm
9 forgetting the word. They have --

10 MEMBER BALLINGER: Plus or minus 45, 40-
11 degree or 45-degree texture, but it rotates because of
12 the way the tubing is rocked or fabricated.

13 MS. BALES: So, as far as burst behavior
14 and the phenomena that we're looking at here, I don't
15 see that that is going to have an impact. Like I
16 said, the properties in each direction are different
17 because of the texture of the cladding, but not in a
18 way that should vary significantly over the axial
19 length.

20 MEMBER BALLINGER: These bursts are
21 notoriously difficult to interpret.

22 MS. BALES: So, there was a lot of
23 discussion about this at the Subcommittee. So, I
24 actually added a slide on this topic as well to kind
25 of expand on the impact of experimental conditions on

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

(202) 234-4433

www.nealrgross.com

1 the things that we are measuring. I'm going to get to
2 that next.

3 I'll just finish by saying that the
4 segments are cut from full-length rods. They're about
5 30 to 50 centimeters in length. And they are
6 repressurized. There is a pressure line that is
7 integrated into the system and can vary the pressure,
8 and in many cases the test conditions included
9 variability in the pressure because that was a
10 parameter that we wanted to investigate.

11 MEMBER BALLINGER: Once you go above the
12 phased transformation, all that stuff goes away.

13 MS. BALES: Yes.

14 MEMBER BALLINGER: So, you know, depending
15 on where the burst occurs.

16 MS. BALES: So, as I said, I wanted to
17 expand on the influence of the experimental methods
18 because the tests that were done in all of the hot
19 cell programs had -- as I said, they are prototypic
20 materials; they're prototypic cladding and fuel, but
21 there are non-prototypicalities.

22 So, for example, if we look at the axial
23 length, the variability of heat is going to have a big
24 influence on the strain behavior. And so, on this
25 image, we see a very sharp increase in strain centered

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 in the middle of the furnace, and there is quite a
2 large strain. This axial profile, this strain
3 profile, is probably not prototypic of anything you
4 would see in a reactor. You would have a much more
5 uniform heat applied on a length of this -- of this
6 length --

7 (Internet connectivity problem.)

8 CHAIRMAN SUNSERI: It's the internet
9 connection.

10 MS. BALES: Okay. We're back.

11 So, the strain profile and, most likely,
12 the max strain are not prototypic. In addition, as I
13 mentioned, we have short segments, and it's not
14 obvious how to scale the short portion of the fuel rod
15 that's going through these LOCA conditions to a full-
16 length rod.

17 So, on this image, I have the X-axis burn
18 up and the Y-axis is the mass of fuel, like the actual
19 amount of fuel that was collected. We can't multiply
20 that mass by any ratio of the segment length to a
21 full-length rod. That wouldn't be meaningful to do.
22 And finally, the burst opening size varied in the
23 test, and it's not obvious that these burst opening
24 sizes are prototypic.

25 Nevertheless, as I start to describe how

1 the experiments were used to derive empirical limits,
2 I want to make the case that the empirical limits are
3 derived in such a way to be independent of any
4 experimental non-prototypicalities. We don't use the
5 mass of fuel collected and multiply it by the full
6 length. We don't use the length of the cladding that
7 experienced greater than 3 percent strain in any of
8 our empirical limits.

9 So, I will return to this concept as I
10 walk through the empirical limits, but I want to argue
11 that they are based on the physical constraints of the
12 cladding and diverse opening and not a skilled
13 interpretation of the quantities measured in the
14 tests.

15 MEMBER PETTI: So, just a question on the
16 burnup. That's fairly uniform over the sample
17 because --

18 MS. BALES: In these short samples, it's
19 fairly uniform. So, in a full-length rod it would
20 vary, but the samples of 30 to 50 were relatively
21 flat.

22 MEMBER PETTI: So, to extrapolate that
23 burnup to a reactor core, it's the peak burnup on the
24 rod most likely or the center portion of the rod?

25 MS. BALES: So, what we've described, the

1 empirical limits would be pellet averages. And then,
2 through an analytical tool, you would determine what
3 the local burnup would be, and then, you would define
4 a limit.

5 MEMBER PETTI: So, it's burnup, but it's
6 the local burnup?

7 MS. BALES: Yes.

8 MEMBER BALLINGER: I've got to assume that
9 I have the wrong slides.

10 MS. BALES: This slide is also new.
11 There's three new slides. We've gone through two of
12 them. There's only one more to go.

13 (Laughter.)

14 Like I said --

15 CHAIRMAN SUNSERI: Your assumption is
16 confirmed.

17 VICE CHAIRMAN REMPE: Tell us before --

18 MEMBER BALLINGER: We all have the wrong
19 slides.

20 MS. BALES: I apologize. Yes. So, like
21 I said, after the Subcommittee meeting, there was sort
22 of three areas that I felt deserved some time, and I
23 added slides to facilitate that discussion. And I
24 will get the presentation that includes those slides
25 after this, all of the slides, except for this one at

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 the end.

2 MEMBER PETTI: So, just another question
3 before you go. The stain profile that's shown, given
4 that it's a short segment, the gradient with respect
5 to distance is probably steeper than is seen in a
6 reactor.

7 MS. BALES: Yes. Yes.

8 MEMBER PETTI: Okay. From an analytical
9 perspective, can they can calculate anything close to
10 this?

11 MS. BALES: That is discussed in the
12 limitations of this RIL at the end. We acknowledge
13 that the limits are based on local conditions, and
14 that the tools that we have right now are really
15 catered to calculating the max strain. They haven't
16 really been calibrated to calculate the length of the
17 (audio interference) event.

18 So, creep models are well-informed. And
19 so, there's not exactly a reason to believe that we
20 have no understanding of that, but it's behind
21 something that deserves some further validation.

22 MEMBER BALLINGER: Yes, I took the liberty
23 after the Subcommittee meeting of contacting a
24 modeler, whose name shall remain anonymous, and asked
25 that person, what's the strain at burst in these tests

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 calculated? And he says, "What do you want it to be?"

2 (Laughter.)

3 So, it's very uncertain, very uncertain.

4 MEMBER PETTI: Well, you know, I mean,
5 creep, especially the time --

6 MEMBER BALLINGER: Yes.

7 MEMBER PETTI: -- I mean, there's just so
8 many variables; it's always difficult -- always.

9 MS. BALES: Yes, and I think as we get
10 into the information in the RIL, you know, Kim already
11 mentioned it and it's really important to drive home.
12 The RIL outlines what I call the on/off switches, like
13 when do these phenomena start and stop? It is not the
14 full picture. In order to really use those, there's
15 a whole lot of analysis that has to happen.

16 What you're both describing in terms of
17 what are the fuel rod conditions and exactly what is
18 the (audio interference), but prior to that, looking
19 at the LOCA conditions and understanding what kind of
20 hydraulic bounding conditions these rods are being
21 subject to, whether they actually reach the
22 temperatures that are required -- this RIL is really
23 just a piece of a much bigger puzzle. And I think
24 it's important to keep that in mind when looking at
25 what it is and what it is not.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 MEMBER HALNON: Well, given that, that the
2 picture is not clear yet, why the RIL now? I mean,
3 what's the urgency in getting this?

4 MS. BALES: So, in order to do any of that
5 analysis that would follow from this, you have to know
6 the on/off switches. That is a key part of a more
7 complete analysis. You have to know when the
8 phenomenon occurs in order to say what are the
9 implications; when is it occurring? And so, the
10 RIL --

11 MEMBER HALNON: It's just puts the
12 regulatory piece in a very precarious situation,
13 because now you have these on/off without the full
14 picture. What do you do with it? I mean, do you
15 start backfitting and start setting limits? Do you
16 come back? What is NRR going to do with this, given
17 the fact that it's just on/off?

18 MS. BALES: I see our colleague in NRR
19 stepping to the microphone.

20 MR. DONOGHUE: Good morning.

21 CHAIRMAN SUNSERI: Please state your name.

22 MEMBER BALLINGER: By the way, before we
23 get started, I've been informed that, in Cinderella
24 fashion, your time is going to be up in 20 minutes.

25 MS. BALES: I'd better get moving.

1 MEMBER BALLINGER: So, we'd better get
2 moving.

3 MR. DONOGHUE: And I'll be brief.

4 My name is Joe Donoghue. I'm the Division
5 Director of Safety Systems in NRR, working closely
6 with Kim and her staff.

7 We expect to use the RIL to guide our next
8 steps, and we haven't decided what they are because
9 the RIL is not quite final, but, as Michelle has
10 mentioned, it could be the basis for guidance. In the
11 past, that's what we've done. But, as you're all
12 realizing here, there is a lot of uncertainty in the
13 information, a lot of gaps.

14 And what prompted us to talk about actions
15 that we could take to update our knowledge is that
16 industry has made it clear that high burnup fuel, you
17 know, batches of high burnup fuel, is something that
18 they want to pursue in license. So, we felt like we
19 needed to update the information, the understanding
20 that we had from 2015. I think you had a slide up
21 there, Michelle, to show that SECY paper. And then,
22 decide what has changed, what do we know. Do we have
23 a basis to go further than burnup? What do they want
24 to propose? Do they want to go higher in high
25 burnups, then, that would be licensed by a Topical

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 Report?

2 So, what we're going to do is review the
3 RIL, work with Research, and as Michelle pointed out,
4 usually vendors, when they submit it, they might have
5 information that would help fill some of the gaps,
6 would help us understand better what we can allow to
7 be licensed.

8 Until we see all that laid out, it's hard
9 for me to say that we're going to change any of the
10 current limits that are out there, okay, one way or
11 the other. Okay?

12 So, another point, and then, I'll stop,
13 is -- and I think you're going to get to this,
14 Michelle. In your presentation, which was very good,
15 I thought it made clear that the concerns about FFRD,
16 it's not just the "FF," the fragmentation; it's the
17 relocation and dispersal, which depends on other
18 factors. I think you all know that.

19 So, we have to understand all that better
20 before we make a decision about exactly what we're
21 going to do in a regulatory framework. Does that
22 help?

23 MEMBER HALNON: Yes, it does to some
24 extent, which basically says that the increased burnup
25 discussions are on hold until we get the full picture.

1 MR. DONOGHUE: Yes.

2 MEMBER HALNON: That's what I heard.

3 MR. DONOGHUE: Well, I'll say that we felt
4 it was premature to try to set down guidance, because
5 without an update to the information, it could be very
6 conservative guidance.

7 MEMBER HALNON: Right. That's what I'm
8 trying to see.

9 MR. DONOGHUE: We'll still having
10 presubmittal meetings with vendors on their proposals.
11 So, that's why I didn't want to just say yes, because
12 there are discussions that are continuing, but they're
13 presubmittal; we're not doing extended high burnup
14 with views over 75.

15 MEMBER HALNON: Okay. So, the timeline
16 for -- and I'll let you go after this -- the timeline
17 to get this full picture is important, because if
18 you're having presubmittal meetings, somewhere at some
19 point they're going to collide and you're going to say
20 "No," until they get the full picture. So, okay.

21 MEMBER BALLINGER: Now I'll violate my own
22 previous statement. We have a case here where we have
23 actual data, but it's highly uncertain in terms of its
24 effect and the relationship between that data and the
25 real world, and what one member has called "Chapter 15

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 hell," where you end up with a very stylized analysis
2 that must be done.

3 MR. DONOGHUE: Right.

4 MEMBER BALLINGER: And when you tack on
5 the uncertainty here, which results in very
6 conservative assumptions, with the Chapter 15
7 analysis, it can be difficult.

8 MR. DONOGHUE: Understood. And that's why
9 I'm tiptoeing around so much and saying I don't want
10 to prejudge the staff's conclusions, until we've heard
11 from the RIL and from all these sources, to understand
12 how to best come to reasonable assurance/conclusion
13 based on all these uncertainties. I mean, there's
14 other areas, you're aware, where we've dealt with
15 uncertainties before. This is, yes, definitely
16 difficult.

17 MEMBER BALLINGER: You've got to move.

18 CHAIRMAN SUNSERI: Yes. I'd like to ask
19 one question, though. Joe, you can stay for this one.
20 I just want to understand. I missed the Subcommittee,
21 and I apologize if this is a redundant question.

22 But it sounds to me like, and I heard
23 Michelle say, that this is a compilation of publicly
24 available information compiled to present to NRR to
25 aid your knowledge and your decisionmaking when it

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 comes to this topic. So, it seems to me that -- is
2 that the way NRR is planning to use this, as
3 information to help them understand whatever their
4 gaps in their knowledge are, and when they review
5 applications, what questions they should be asking,
6 based on public information, available information,
7 and help make sure you get the in-depth review that
8 you need to do versus a definitive limitation on what
9 you can approve and not approve?

10 MR. DONOGHUE: Yes.

11 CHAIRMAN SUNSERI: That's not a very well-
12 organized question, but --

13 MR. DONOGHUE: It could be -- I'm sorry.

14 CHAIRMAN SUNSERI: Go ahead.

15 MR. DONOGHUE: It could be used to put
16 down definitive guidance, but I'm not ready to say
17 that's exactly what we're going to do, because it may
18 just help us inform the reviews, as you said, to
19 understand what questions to ask, and then, we may
20 have to somehow account for these uncertainties with
21 conservatisms.

22 In other areas, you may remember a couple
23 of years ago the coated cladding ISG that went out.
24 It was, I think, much more solid information. The
25 staff, we felt confident being able to issue guidance

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 on that that applicants could use.

2 In this case, right now, this is what's
3 happening. This is what's happening right now.
4 Vendors see the challenge and they're approaching it
5 in different ways. We're not ready to say that,
6 because it would be prejudging this, that one approach
7 is better or worse than another. So, at some point,
8 though, we think we could know enough -- and I'm not
9 saying the RIL is it by itself -- but at some point we
10 would have enough information that we should be able
11 to put some guidance together. I'm just not ready to
12 say when and how we do that.

13 CHAIRMAN SUNSERI: Yes, and, no, I'm not
14 asking for that. It was just how this information
15 might be utilized. You answered my question. Thank
16 you.

17 MR. DONOGHUE: Yes.

18 MS. BALES: Given the time constraints,
19 I'm going to skip a couple of slides.

20 CHAIRMAN SUNSERI: Don't feel overly
21 constrained. I mean, you know, don't load your time,
22 but take whatever time you need to get your points
23 across.

24 MS. BALES: Well, I think, based on the
25 interest that I'm hearing, there's a couple of slides

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 that we've prepared that will address some of this
2 topic. And how about I go through that? And then,
3 I'm going to skip some of it. But if there's
4 questions based on either followup from the
5 Subcommittee or reading the RIL, I can definitely go
6 back to it. I just want to make sure that, before I
7 really do run out of time, that I've made a couple of
8 key points. So, I'm going to appear to be skipping
9 through the slides, but --

10 CHAIRMAN SUNSERI: But just so I make
11 sure, since I'm moderating this, you're the last
12 presenter or there's more?

13 MEMBER BALLINGER: No, NEI.

14 CHAIRMAN SUNSERI: Well, NEI, they have
15 seven slides, right. Okay, I've got it.

16 MS. BALES: The slides that we've
17 presented here are all that the staff has prepared.

18 CHAIRMAN SUNSERI: Okay.

19 MS. BALES: So, I'll be speaking to a
20 couple more slides.

21 CHAIRMAN SUNSERI: Okay. Great. And how
22 far along are you into that?

23 MS. BALES: Not very far.

24 (Laughter.)

25 CHAIRMAN SUNSERI: Okay. Go ahead.

1 MEMBER BALLINGER: Think about 9:40.

2 MS. BALES: Okay, I'm going to wrap up at
3 9:40.

4 So, I put all of these images on the slide
5 because I wanted to kind of give you the impression
6 that, if you just open up a bunch of these reports
7 that have documented FFRD research, you could look at
8 this and say, wow, there's a lot of fragmentation
9 there. There is a lot of phenomena that we don't
10 really understand. Why is it happening in this circle
11 pattern in that image? How do we make sense of all of
12 these fragments? And you can come away thinking that
13 this is sort of an intractable problem.

14 And with the RIL, I really want to argue
15 that it's not an intractable problem; that, in fact,
16 we know quite a bit about when FFRD occurs and, most
17 importantly, when it does not occur. And with that
18 information, we've presented the RIL to really allow
19 for a focus of fuel safety analysis on only the rods
20 and portions of the rods that matter. And I think
21 that's really the mean outcome of the RIL, is to focus
22 safety analyses.

23 So, we've addressed these five elements.
24 I won't go through them because I'll have to speak to
25 them in the next slide. I'm going to walk through

1 this outcome of the RIL talking about the focused
2 analysis using this cartoon stylized image.

3 What this represents is a depiction of
4 each assembly in the core relative to its burnoff and
5 its operating power at a single point in life. And I
6 use this because it will help illustrate how the RIL
7 helps to focus the analysis from all of these rods and
8 the full length of these rods to just a handful that
9 actually are vulnerable to FFRD.

10 So, the RIL lays out fine fragmentation is
11 not occurring in fuel rods below about 55. That means
12 that during steady-state operation there is some
13 pellet cracking and there is some large fragments that
14 you will observe at the end of life, but that this
15 transient phenomena where the fragments become more
16 fine has only really been seen when you're getting to
17 burnoffs above 55. So, every rod below that does not
18 need to be examined for its susceptibility to fine
19 fragmentation.

20 When you look at relocation, this is where
21 a fuel pellet falls axially into the balloon region.
22 This also has not been seen unless you have fine
23 fragmentation, and it requires ballooning, which is
24 temperature-dependent. So, only rods that are
25 operating at a high enough power during operation, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 therefore, will see high temperatures during the
2 transient, are vulnerable to fuel relocation. So,
3 again, a limited number of rods that are of concern.

4 MEMBER BALLINGER: Is there any thought
5 that the fine fragments may come from the rim?

6 MS. BALES: We have examined that, and
7 there was some work done, sponsored by NRC, and then,
8 followed up by SCIP, to look at the origin. For rods
9 between 50 and 60, we see that the fine fragments are
10 almost exclusively from the rim region. But, as you
11 go up in burnup above 70, there's evidence that those
12 fragments come from the entire radius, even from the
13 center.

14 Dispersal is also limited. Physically,
15 you can only disperse fuel if you have burst, and you
16 can only disperse fuel that has moved from another
17 part of the rod into the burst region. And so, a
18 dispersal is also limited by the boundaries of fine
19 fragmentation and relocation.

20 I forgot to mention why I put the image on
21 the lefthand side. We've seen that relocation
22 requires local cladding strain. If the cladding is
23 still tightly binding the fuel, you don't have axial
24 relocation. So, even where I'm drawing this box
25 around rods with high enough power and the right

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 burnup, we're still not talking about the full length
2 of the rod. We're only talking about the region above
3 and below the burst which has strained to around 3
4 percent.

5 So, this dispersal zone is relatively
6 small. The area, the fuel rods that have a concern
7 that need to be examined for their vulnerability and
8 quantity of dispersal is probably small and it is
9 affected by the core loading pattern. And depending
10 on your ECCS response, your plant design, loading
11 pattern, and even fueling cladding designs, you may
12 have a core that has no rods operating in this
13 dispersal box.

14 The RIL also addresses transient fission
15 gas release, and the reason is that transient fission
16 gas release -- in other words, fission gas release
17 that occurs during the transient, not during (audio
18 interference) elaboration -- will increase the rod
19 internal pressure during a LOCA event. And rod
20 internal pressure is a key determinant for whether the
21 rod bursts. So, accurately predicting rod internal
22 pressure is essential to accurately predicting burst,
23 which is essential to accurately predicting dispersal.
24 So, accounting for transient fission gas release is
25 required in order to correctly estimate how much

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 dispersal a certain core might experience.

2 MEMBER BALLINGER: Might we be getting the
3 cart before the horse? Excuse me. Might we be
4 getting the cart before the horse a little bit? At
5 high burnup, the fission gas is mostly located on
6 grain boundaries, I think, and if it's in the rims,
7 for sure. And if you have a very high temperature,
8 fast temperature transient, that fission gas may form
9 instant bubbles and blow and cause the fragmentation,
10 the fines.

11 MS. BALES: So, there is a hypothesis that
12 the fine fragmentation has something to do with
13 trapped fission gas release and cleaving of the pellet
14 to further fragment it. What I'm referring to here,
15 though, has been seen experimentally, that when a
16 modeler is trying to predict burst or non-burst, and
17 they don't account for transient fission gas release,
18 they have gotten the prediction wrong. When they tune
19 their model to account for a transient fission gas
20 release, they can better identify the moment of burst.

21 So, here I'm not talking about the
22 mechanism for fine fragmentation. I'm just simply
23 saying that accounting for transient fission gas
24 release is important to predicting burst.

25 MEMBER BALLINGER: You used the word

1 "tuning," and I use the word "fudge factor."

2 (Laughter.)

3 MS. BALES: Yes, that is fair.

4 VICE CHAIRMAN REMPE: All modelers use
5 fudge factors.

6 (Laughter.)

7 MEMBER BALLINGER: In this case, we're
8 serious.

9 MS. BALES: Well, you know, no, and to
10 take the point seriously, these are empirical limits.
11 They are not mechanistic models. And we have to be
12 aware of that when we're applying them, not only just
13 in the case of uncertainty, but just in the case of we
14 can't apply this information beyond what it was
15 measured against. We can't apply it to new
16 conditions. These are highly empirical.

17 MEMBER BALLINGER: Which means, in
18 layman's terms, you can't extrapolate.

19 MS. BALES: Exactly. Exactly.

20 The last item that the RIL addresses is
21 packing fraction, and I talked about axial fuel
22 relocation before and the possibility of fuel from
23 above the burst opening to fall into the burst area.
24 In non-burst rods, we care about how much fuel is
25 located in that region because it affects the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 temperature. That additional fuel needs to be
2 accounted for when you are determining the decay heat
3 load in that region, and that's essential for
4 identifying the cladding temperature, which is our
5 deterministic metric for LOCA success. Heat cladding
6 temperature is the limit, one of the key limits for
7 loss of coolant.

8 MEMBER KIRCHNER: May I ask a question?

9 Yes, I'm looking at this -- I'll take off my mask for
10 a moment. Isn't temperature much more important than
11 linear heat generation rate? I'm just curious why
12 you're applying it against linear heat generation
13 rate.

14 MS. BALES: So, temperature during the
15 transient is the key determinant. And this is really
16 depicting the power of the operating rod prior to the
17 transient.

18 MEMBER KIRCHNER: Yes.

19 MS. BALES: And so, it's imperfect, but I
20 use this cartoon just to kind of depict the population
21 of rods in the core to emphasize the point that we're
22 not talking about the entire core. But if we're
23 actually determine whether each of these rods
24 experiences the phenomenon, you're right, the
25 temperature during the transient is the key

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 determinant. This is just the stylized illustration
2 to kind of scoop the situation more than it is to --

3 MEMBER KIRCHNER: Thank you.

4 MS. BALES: -- kind of (audio
5 interference) the on/off switch.

6 MEMBER BALLINGER: I keep coming back to
7 the prototypicality, if that's a word. The heat
8 generation rate that results from nuclear heating
9 results in a temperature profile that's way different
10 from a furnace. No matter what you do, you can't
11 reproduce that. And the first time you heat the fuel
12 up, it's going to crack in real life. Has anybody
13 done any work to see if they just do one cycle of
14 parabolic heating that cracks the fuel, and then, runs
15 a balloon test to see if you get any dispersal from
16 just the fact that the fuel is cracked due to the
17 thermal gradings?

18 MS. BALES: So, there were tests done in
19 the SCIP program at 40 gigawatt days per metric, for
20 example. So, those rods would be irradiated in the
21 reactor. They had prototypical end-of-life cracking
22 that you would expect from steady-state operation, the
23 thermal --

24 MEMBER BALLINGER: Right, but they were
25 cracked at .1 gigawatt days per metric.

1 MS. BALES: Right. What I'm saying is
2 that those rods experienced a transient, and we did
3 not observe fine fragmentation in --

4 MEMBER BALLINGER: I don't mean by fine
5 fragmentation. What I'm saying is you've got cracked
6 fuel.

7 MS. BALES: Yes.

8 MEMBER BALLINGER: And then, you have a
9 ballooning problem and you rupture the fuel. You
10 rupture the cladding. Do you get dispersal of those
11 fragments, not fine, but those fragments?

12 MS. BALES: So, in this RIL, we're only
13 proposing that rods with fine fragmentation are the
14 ones that are concern for dispersal. So, the large
15 fragments of a lower burnup would not be --

16 MEMBER BALLINGER: Okay. I'm just trying
17 to center myself on where this -- what happens when
18 and where.

19 MS. BALES: Right.

20 MEMBER BLEY: This is more of a question
21 for Ron, but for you folks, too. We've got empirical
22 evidence of when we've had bursts. But if you get
23 fuel fragmentation and begin to rearrange things a
24 bit, you're kind of packing tighter. So, even if they
25 didn't get bursts, if you go through any thermal

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 cycles, you may be really stressing that clad in
2 unexpected ways. I don't know if anybody has played
3 with that.

4 MEMBER BALLINGER: If you're not careful,
5 in the very early days, they had basically zero -- I
6 mean, in the early days, they had --

7 MEMBER BLEY: I remember.

8 MEMBER BALLINGER: -- basically zero gap.

9 MEMBER BLEY: That's what got me thinking
10 about that, yes.

11 MEMBER BALLINGER: Which that was not a
12 good thing.

13 MEMBER BLEY: And they broke a lot, yes.

14 MS. BALES: In the RIL, there is a
15 reference to some work done at the National Labs to
16 look at the comparison of Halden's temperature profile
17 to the hot cell tests. So, just to kind of address,
18 I think, the underlying concern that these hot cell
19 tests are not simulating the temperatures -- I should
20 get closer, yes; sorry -- the initial portion of the
21 transient will look different when you're looking at
22 the radial temperature profile across the pellet in
23 the two tests. But, after about 27 seconds -- I'll
24 say after about 30 because 27 is too -- that the axial
25 -- sorry -- the radial temperature profile in both

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 Halden-style tests and hot cell tests is actually the
2 same.

3 And so, while the irradiated effects --
4 sorry -- the effects of nuclear heating are not
5 negligible -- sorry -- they are not non-existent; they
6 are there, especially at the beginning, as the
7 transient continues, there's been some analysis to
8 show that the radial temperature profile is very
9 similar, and it's that radial temperature profile, the
10 differences in the temperature across the pellet, that
11 we believe have something to do with the
12 fragmentation. So, the fact that they're similar
13 suggests that the fragmentation might be similar as
14 well.

15 So, given the amount of time and the
16 suggestion to wrap up at 9:40, I'm going to skip the
17 discussion of the specific basis for each of these
18 limits. That does not mean that -- obviously, if
19 there are questions, I am going to go through it.

20 So, this is not a suggestion that we skip
21 the material. I just want to make sure to address the
22 third new slide. Sorry, Mr. Ballinger, that there's
23 one more slide that I think speaks to what questions
24 have been asked today and really the questions that
25 started to come up on the Subcommittee about where the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 RIL fits into the bigger picture. So, if it's okay,
2 I'm going to skip to that slide, and then, I'll take
3 feedback as far as whether I should come back into
4 these technical details. The material in here is
5 really explaining -- there's some good videos, but,
6 again, I can come back to this.

7 Okay. I want to present this slide to
8 come back to some of the discussion that we were just
9 having. So, when making a determination of whether
10 fuel dispersal is a problem, I think we have to kind
11 of go at the very highest level of what is the
12 likelihood of a LOCA event in the first place. We
13 understand that this is a design basis accident. So,
14 from a regulatory perspective, it must be analyzed.
15 LOCAs are a design basis event. We recognize that
16 it's a low probability event, but, nevertheless, it's
17 a required analysis.

18 Then, if you are predicting a loss-of-
19 coolant accident, there are a variety of loss-of-
20 coolant accidents of varying severities. The testing
21 that was done predominantly is designed to simulate
22 double-ended guillotine large break LOCA. And so, we
23 recognize that the technical basis that we're
24 pointing to here is a particular type of LOCA. And
25 so, informing this section above of which LOCA

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 conditions will actually prompt the conditions that
2 we've observed FFRD is an important step.

3 Then, once you know the conditions that
4 you are subjecting your rod to, then you ask yourself,
5 well, what is the fuel response to those conditions?
6 When do the phenomenons I'm concerned about occur and
7 when do they not occur? And really, that is what the
8 RIL does. It's just this one piece.

9 After you've determined that you
10 experience relocation and potentially dispersal, then
11 you want to know how the system responds. Where does
12 that fuel go? Is there a recriticality? Are there
13 other unanalyzed conditions that arise from fuel in
14 the coolant that wasn't expected to be there? That
15 happens outside of the RIL; that's after the RIL.

16 And then, finally, there's a lot of
17 conservatism in the licensing basis. So, even when
18 you're predicting some fuel dispersal or other
19 consequences of a LOCA, we may find that the licensing
20 basis is conservative enough to account for that, and
21 the licensing basis isn't challenged by that new
22 information. That, again, is outside of the scope of
23 the RIL, but is an important step to understanding the
24 scope.

25 MEMBER BALLINGER: I would very much --

1 oh, okay, you haven't completed the slide. Okay.

2 MS. BALES: I love animation.

3 (Laughter.)

4 So, it keeps going.

5 MEMBER BALLINGER: But I'll say it anyway
6 because it's getting to the end. I would have liked
7 to see on this slide a line between Research and NRR
8 and a box somewhere below the line, I assume, that
9 says, "Consequences."

10 MS. BALES: Right.

11 MEMBER BALLINGER: In other words, we
12 observe it --

13 MS. BALES: Yes.

14 MEMBER BALLINGER: -- undeniable. We
15 don't know -- we have a very large amount of
16 uncertainty in what's going on, but unless that gets
17 translated into consequences --

18 MS. BALES: Yes. So, the green box should
19 say, "Consequences." That is what I meant.

20 MEMBER BALLINGER: All right.

21 MS. BALES: The green box is like the
22 system response. It's, can the system and the MRC
23 core cooling system accommodate fuel dispersal? Said
24 another way, that is the consequences.

25 And what I want to communicate is that, in

1 order to do that analysis, you must have the
2 boundaries of the box. The RIL establishes those.
3 And so, you cannot possibly do the consequences
4 analysis without knowing when you get the
5 consequences.

6 And so, I am very --

7 MEMBER BALLINGER: But, again, I'll hate
8 to cut you off, but I would maintain that you need to
9 estimate the consequences first, because that gives
10 you direction on how detailed you have to go; aka how
11 much money you have to spend, or to force the
12 suppliers to spend --

13 MS. BALES: Yes.

14 MEMBER BALLINGER: -- to go after this
15 problem.

16 MS. BALES: You know, I think that's a
17 fair point, and I think that others have argued that
18 you could kind of do it either way. You could either
19 identify where the cutoffs are, and then, determine if
20 you can accommodate that kind of response, or you're
21 what is the amount of fuel that I can accommodate, and
22 then, work backwards to create your design limits to
23 prevent that.

24 MEMBER BALLINGER: I just wonder whether
25 we get ourselves trapped in what I call the Rockwell

1 effect. Rockwell was critical of our industry because
2 we had a habit of piling piles and piles of
3 conservatisms on something that was unneeded. And
4 then, when the time came to backtrack and get rid of
5 some of that conservatism, it became a non-technical
6 problem, aka a political problem that was very
7 difficult to solve.

8 MS. BALES: You know, I'm very empathetic
9 to that argument. I think that that is an important
10 consideration, especially in an issue like this.

11 What I will say, though, is that, at this
12 moment, we live in a deterministic world. The
13 regulations are set up to be what they are. We have
14 criteria that say you must show compliance with 50.46;
15 you must show that you're below this oxidation limit;
16 you must show that you're below this PCT limit.

17 So, it's a fundamental shift. It's not
18 something that you can just wrap around at the end and
19 say, well, yes, technically, the regulations say this,
20 but here's how we're going to make sense of it. It
21 has to be done with rigor. It is definitely possible
22 to really scale out and look at the bigger picture,
23 and the RIL is part of that also, because in order to
24 do that, I said you still have to know when the
25 phenomenon occurs to do all of that work. So, the RIL

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 does not preclude an approach that would kind of work
2 the problem backwards, and it doesn't preclude an
3 approach where you have sort of risk information
4 wrapping around the phenomena.

5 At this moment at this day, though, the
6 criteria that are in place for loss-of-coolant
7 accidents are deterministic, and we have to
8 acknowledge that.

9 It is 9:42. This is the point that I
10 wanted to make.

11 MEMBER BALLINGER: I look to the Chairman.

12 CHAIRMAN SUNSERI: We're going to be
13 writing a letter on this. So, we want to be well-
14 informed.

15 MS. BALES: Okay.

16 CHAIRMAN SUNSERI: Get your points across.

17 MEMBER PETTI: Can I ask just a question?
18 You know, you put these extra sides to help us
19 understand the context.

20 MS. BALES: Yes.

21 MEMBER PETTI: I worry that others don't
22 understand the context. This document will come out.
23 It will be public.

24 MS. BALES: Yes.

25 MEMBER PETTI: It says 55 megawatt days.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 People say, what does that mean for the current fleet,
2 which is not really what your issue is.

3 MS. BALES: Uh-hum.

4 MEMBER PETTI: But it could be
5 misinterpreted to be that.

6 MS. BALES: Yes.

7 MEMBER PETTI: I think you need like a
8 foreword in the document --

9 MS. BALES: I totally agree.

10 (Laughter.)

11 MEMBER PETTI: -- that puts this context
12 in place, so that people don't run off -- if we're
13 going to do it, lots of people will do it is my sense.

14 MS. BALES: I think that's an excellent
15 idea. And in fact, that is definitely the conclusion
16 we came away with from the Subcommittee meeting.
17 Sometimes, you know, I have to say, like writing this
18 document, I've been working with this data for a year.
19 I've been in it, and I didn't see the potential until
20 the Subcommittee like I did during that meeting. And
21 I came away thinking, you know, there's some context
22 missing. And so, at Kim's suggestion, we are going to
23 add a foreword. I've already drafted it. We've
24 reviewed it. And I think it's incredibly important,
25 and I think that it's possible that this RIL did not

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 stand on its own the way I thought it did, and we're
2 going to address that.

3 MEMBER HALNON: That would satisfy me with
4 the NRR interaction I had relative to, what do you do
5 with this?

6 MS. BALES: Right.

7 MEMBER HALNON: So, that would be
8 excellent.

9 MS. BALES: Yes.

10 VICE CHAIRMAN REMPE: I think this is a
11 great idea. Again, I'm just wondering, I mean, is
12 this still the right time for the letter? Or should
13 we see the foreword? I mean, you're going to get
14 comments about that, and I'm just wondering about
15 timing. But, again, I'm just one member and I'm just
16 listening to this going, man, it sounds like some
17 major improvements can be made.

18 MS. WEBBER: This is Kim Webber.

19 Yes. So, that's a good question. So, we
20 have like a working draft. We haven't completed the
21 draft for the foreword, but I think it's a good idea
22 because a lot of what I said in my opening remarks,
23 and what Michelle has talked about, is in that
24 foreword. So, actually drafting the foreword helped
25 us put the context into words for this presentation.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 So, I don't know what your timing is for writing the
2 letter, but we can definitely work on it, you know,
3 probably over the next week or so. We want to make
4 sure that our partners in NRR have a chance to weigh
5 in and take a look at it as well.

6 VICE CHAIRMAN REMPE: So, we don't have
7 January full Committee meeting. We have February and
8 it's very packed, and things like that. But I'm
9 listening to this going, man. I mean, we're here to
10 help the agency in writing a letter with a lot of
11 concerns versus a letter that says, hey, we've
12 assessed this --

13 CHAIRMAN SUNSERI: We write letters all
14 the time on things that aren't final. We say I think
15 it would be a good idea to have a foreword. That
16 could be a recommendation coming from us, and you do
17 it. So, it sounds like we're in agreement on that
18 topic already.

19 MS. BALES: Yes. Okay.

20 MEMBER BALLINGER: You know, I hate to
21 what is going to be amounting to beating a dead horse,
22 but -- sorry about the dead horse part. But the fact
23 that you get fuel fragmentation and dispersal, if you
24 want to call it that, at 55, that does not mean that
25 it makes any difference. And that's why the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 consequence thing becomes very, very important.
2 Because we've been doing -- we've got a lot of fuel
3 out there that's above 55, without having a LOCA, by
4 the way.

5 And so, I think the foreword that you're
6 talking about would be very informative, but something
7 else might be also informative. And that is, there's
8 been very little -- you know, I understand the
9 difference or the distinction between NRR and
10 Research. But this is one case where Research
11 produces a document that has the data analysis in it,
12 but the immediate use is for NRR.

13 And so, I wonder -- and I don't know how
14 the RILs actually work -- whether or not there should
15 be some NRR input, a little feedback, with respect to
16 the foreword that you do. Maybe I'm using the
17 wrong words --

18 MS. BALES: No.

19 MEMBER BALLINGER: -- but there's a very
20 immediate interaction here.

21 MS. BALES: Absolutely. So, the RIL
22 itself was reviewed by NRR staff and we had extensive
23 involvement with ensuring that the language in the RIL
24 made sense and was in the right context for NRR. The
25 foreword would be the same. We've drafted it and we

1 would show it --

2 MEMBER BALLINGER: My guess is that NEI
3 could have written the foreword. Their concerns are
4 with the use.

5 MS. WEBBER: Well, no. This is Kim
6 Webber. No, NEI cannot write the foreword.

7 MEMBER BALLINGER: I didn't --

8 MS. WEBBER: It's an NRC document.

9 (Laughter.)

10 It's a Research document.

11 MEMBER BALLINGER: No, no. It's the wrong
12 PhD thesis supervisor. Okay.

13 But my point is, the industry's concerns
14 would be addressed in a foreword, would likely be
15 addressed in a foreword.

16 MS. BALES: It could be. I mean, really
17 the foreword in my mind was really coming out of the
18 concerns that the ACRS members asked and the kind of
19 questions that we got in this forum.

20 But it's not even just that. I think the
21 more eyes that got onto the RIL, the more that we
22 became aware of the things that weren't said and that
23 needed to be said. So, it's really just a fact of
24 dissemination. The more people that see it, the more
25 views that we can collect, and to the extent that we

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 are aware of potential concerns, we hope that the
2 foreword addresses it.

3 It may not address all concerns. It's not
4 designed to address all concerns. It's designed to
5 put the RIL in context, because we started to see, as
6 we presented it, that some of that context was missing
7 and it was critical and it led to misunderstandings.

8 VICE CHAIRMAN REMPE: Can a foreword
9 suggest this might be a great place to use a risk-
10 informed approach, or something like that? I mean,
11 are you allowed to do something like that, like they
12 did with GSP-191?

13 MS. BALES: I think that is something we
14 should talk more about.

15 VICE CHAIRMAN REMPE: I'm just curious.
16 Yes, I'm not sure how far you can go with a foreword.

17 MS. WEBBER: Yes, I mean, quite honestly,
18 you're talking about a whole different set of
19 analysis.

20 VICE CHAIRMAN REMPE: Yes.

21 MS. WEBBER: You know, that's much broader
22 than just the RIL.

23 VICE CHAIRMAN REMPE: It is, but knowing
24 that this is a design basis type of thing, and there
25 have been other examples in the agency where,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 suddenly, people will start thinking about the low
2 likelihood, and things like that. This issue, it's a
3 way for Research -- and again, it's your perspective,
4 and whatever comes out of the letter that other
5 members are going to be writing -- but it just seems
6 like this would be a good forwarding-thinking
7 suggestion for Research, that even though it's a
8 design basis event -- and it was just a thought.

9 MEMBER BALLINGER: Yes, one last thing, I
10 guess. When I read through the RIL, I was looking at
11 all the data and everything, and then, I got to the
12 appendix.

13 MS. BALES: Uh-hum.

14 MEMBER BALLINGER: And that struck me as
15 ordering on guidance. Well, it is guidance, actually.
16 There's a suggestion of the model to use. And so,
17 that's what got me a little bit worried that it's not
18 information; it's guidance.

19 MS. BALES: So, I think we had to be
20 really careful with the language that we chose, and I
21 think we made an effort to scrub things that smelled
22 like guidance. I think the disclaimer at the
23 beginning of the RIL has to stand in for any
24 interpretation. It clearly says this is not guidance.
25 And if the language is received that way, then, you

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 know, we can look at it again, but I think that the
2 disclaimer at the beginning of the document should
3 supersede it.

4 MEMBER BALLINGER: Yes, I'm not a lawyer.
5 So, I don't know what magic words get interpreted. I
6 looked at it as guidance.

7 MS. BALES: So --

8 CHAIRMAN SUNSERI: I'm kind of thinking of
9 this as the Committee has delved into deliberation at
10 the same time we're getting your presentation.

11 MS. BALES: Yes, I was just going to say,
12 I'm kind of locked up --

13 CHAIRMAN SUNSERI: I'll be lenient with
14 the time because we have a whole hour for
15 deliberation. We have some other things that we need
16 to do during that time, but, please, just go ahead
17 with your presentation. Get the points you want.
18 We'll have time for NEI. Even if it's after 10:00,
19 we'll accommodate them. But more than accommodate
20 them, we want to hear from them. But go ahead with
21 your presentation and give your key points.

22 MEMBER PETTI: I suspect, Matt, at this
23 point, I think we can still write a letter.

24 CHAIRMAN SUNSERI: So, can you talk more
25 into the mic?

1 MEMBER PETTI: I still think we can write
2 a letter in this meeting. We're delaying, you know,
3 we know what February and March is.

4 CHAIRMAN SUNSERI: Yes, yes.

5 MEMBER PETTI: It's just we're making our
6 own -- I trust them to write a credible foreword to
7 put this in context.

8 CHAIRMAN SUNSERI: Yes, yes, yes.

9 VICE CHAIRMAN REMPE: And we can offer
10 suggestions on what's in it.

11 MEMBER PETTI: Right. We can put some in
12 the letter, but I don't --

13 CHAIRMAN SUNSERI: Yes, I think they're
14 getting what they want out of this, a lot of feedback
15 from this Committee --

16 MS. BALES: Uh-hum.

17 CHAIRMAN SUNSERI: -- and we'll formalize
18 it in our letter, but there's other informal stuff
19 that you're already probably going around as well.
20 So, please continue, Michelle.

21 MEMBER BALLINGER: So, that's new slide
22 No. 4.

23 MS. BALES: No, no, no, this was in there
24 before.

25 MEMBER BALLINGER: Oh.

1 MS. BALES: I promise you there's only
2 three new slides, and we've now covered them all.

3 This was very briefly discussed at the
4 Subcommittee meeting, and I'm only briefing going to
5 acknowledge it here. The RIL doesn't discuss
6 consequences. It simply acknowledges the technical
7 disciplines that could need to be analyzed for
8 consequences and points to the mention of those same
9 topics that have been in our documents since
10 NUREG-2121 and 2015. There's nothing new there.

11 I mentioned before --

12 MEMBER BLEY: I'm sorry.

13 MS. BALES: Yes?

14 MEMBER BLEY: Is somebody actively at work
15 on considering those issues, and are we going to hear
16 about that at some point?

17 MS. BALES: So, I think coming to the
18 concept of working the problem backwards, and
19 understanding where does the investment need to be
20 made --

21 MEMBER BLEY: Uh-hum.

22 MS. BALES: -- there was a point where I
23 think we believed that many of the licensing
24 approaches would use a demonstration of no burst --

25 MEMBER BLEY: Okay.

1 MS. BALES: -- as a path forward to
2 disposition fuel dispersal. So, basically, they, you
3 know, the vendors, could introduce sort of operating
4 limits for high burnup fuel that ensured that they
5 were not operated in a manner that would eventually
6 burst.

7 If that is a licensing approach taken,
8 there's no need to look at consequences because those
9 consequences only arise in the event of dispersal.
10 The research that would be needed --

11 MEMBER BLEY: Well, I guess I hang on that
12 one a little bit from what we talked about a little
13 while ago, which is if we do get internally, because
14 of all this cracking, you'll actually get some
15 reconfiguration so we're highly packed, it might not
16 be the burst phenomena we've seen so far; it might be
17 something more akin to what we saw 50 years ago. Yes.

18 MS. BALES: So, when I talk about the
19 consequences on that slide, I'm talking about,
20 specifically, the consequences of dispersal, but
21 you're right that relocation and packing fraction are
22 also addressed are also addressed in the RIL.

23 There are models already in some fuel
24 performance codes that predict fuel relocation and
25 actually have packing fractions, and those could be

1 further validated with existing data or new tests.

2 MEMBER BLEY: Okay.

3 MS. BALES: So, I don't think of the hill
4 as as high to climb in that area. The assessment of
5 consequence analysis I think is going to be really
6 challenging because a lot of analytical tools that
7 could be brought to bear are not based on the exact
8 conditions that are occurring here.

9 MEMBER BLEY: Right.

10 MS. BALES: Whether they're actually valid
11 for this type of analysis is not obvious to me. So,
12 that seems like an analytical exercise that warrants
13 a lot of scrutiny.

14 MEMBER BLEY: Yes, I agree, and back to my
15 question, is anybody at Research working on that
16 already and under some support?

17 MS. WEBBER: So, this is Kim Webber.

18 MEMBER BLEY: And if they see something
19 happening, we'll hear from them?

20 MS. WEBBER: You know, we've talked a lot
21 about that, quite honestly, about using some of our
22 thermohydraulic codes to assess that, but the
23 challenge, as Michelle said, is there's no way to
24 validate what goes on in the code. So, it's not like
25 we haven't -- so, we've talked about it. I'm not sure

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 we have talked with our partner office about the
2 extent of doing that kind of analysis or calculation.
3 So, it's something that we have discussed, but we
4 haven't moved forward on it.

5 MEMBER BLEY: It's good you're thinking
6 about it.

7 MS. WEBBER: Yes.

8 MEMBER BLEY: So, that part is good. And
9 I suspect if you do modeling and you see something
10 that's interesting, that would suggest how we might
11 get experiments to help out.

12 MS. WEBBER: Correct.

13 MEMBER BLEY: Okay.

14 MS. WEBBER: Yes, thanks, Dennis.

15 MS. BALES: So, I'll spend a couple of
16 minutes talking about limitations, because this has
17 also already come up. In a highly empirical document
18 like the RIL, we already talked about it's not
19 possible to extrapolate beyond where the experiments
20 have gone.

21 Two that come to mind particularly are
22 doped fuel and coated claddings. It's physically
23 possible that doped fuel, which has advertised as
24 different transient fission gas retention behavior,
25 could have an impact on FFRD, and coated claddings

1 have been shown in some cases to have different
2 ballooning and burst behavior. And we've seen that
3 ballooning and burst behavior as key to the phenomena
4 that we're concerned about here.

5 Today, the RIL would not cover doped fuel
6 or coated cladding, and the RIL states that. But we
7 imagine that this would be an area that, with some
8 additional information, could be addressed in perhaps
9 a revision to the RIL.

10 We already talked about the second one a
11 little bit here. The prediction of cladding strain is
12 a key factor in using the limits presented in the RIL,
13 and I think more work should be done to validate
14 models for balloon length, for example.

15 Burst opening size. We didn't get into
16 this. It's in the slides and we covered it in the
17 Subcommittee. But burst opening size is a key
18 determinant for how much fuel dispersal that you would
19 expect, and models today are not calibrated to burst
20 opening size. Work that could develop such a model
21 would be incredibly valuable to reduce the
22 conservatism on dispersal quantities. That's for them
23 in the RIL.

24 The first point on this slide about
25 burnup, I didn't talk about it too much here, but I

1 think we talked about it in the Subcommittee, that all
2 of the empirical limits are presented as a function of
3 burnup, but even though we don't have a fully
4 mechanistic understanding, it's very reasonable to
5 expect that burnup is not the primary determinant for
6 these phenomena. It's probably something like
7 porosity or other sort of local, microscopic fuel
8 pellet features.

9 And if further research really delved into
10 some of those parameters, we may be able to derive a
11 function, some of these limits as a function parameter
12 other than burnup that reduces the scatter that we've
13 seen in the burnup plots.

14 So, SCIP-IV is a continuation of the
15 SCIP-III program. We expect that that program may
16 address some of these limitations that we've already
17 identified.

18 And we talked a little bit about analysis.
19 We pointed to the work that was done in 2015. There
20 is work to revisit the approach that was used in 2015
21 to draw the conclusion that this wasn't an immediate
22 safety issue. We want to be able to replicate that
23 kind of calculation easily and perhaps for NRR on a
24 confirmatory basis as applications come in. So, we're
25 building our tools to allow for that. And those are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 the two main things that we're going to be active on
2 in the next year or so.

3 But I think to pull back when I think
4 about the RIL as a foundation for the next step, I see
5 it as this is what we know today. It identifies some
6 of the gaps. It explains what we know, but also a
7 little bit about what we don't know. And I fully
8 expect that some of those gaps will be filled in.

9 And if there's a more mechanistic
10 understanding, there could be a point in the future
11 where the RIL is completely superseded by a better
12 understanding. That would be completely acceptable.
13 That does not negate the value of the RIL today. What
14 it does is prompt a conversation that's meaningful,
15 that's looking at what really matters.

16 And so, when I think about the RIL as a
17 foundation for the next steps and a potential for the
18 building that grows on top of it to be really more
19 relevant than the foundation itself, I think that
20 helps to put the RIL in context. It's what we know
21 today, and it should form the basis for ongoing
22 discussion about where there is value.

23 And as I mentioned also, licensing
24 approaches have a huge role to play. What licensing
25 approaches require will vary, and where the investment

1 needs to be made in order to do additional research,
2 additional analysis, kind of all comes from how far
3 the RIL, how close the RIL gets to serving the
4 licensee needs. And to the extent that it doesn't get
5 all the way there to a licensing approach, it defines
6 the work that needs to be done in a way that I don't
7 think is being done right now.

8 MS. WEBBER: Can I also add, so in terms
9 of what's next also, you know, because we did hear the
10 comments that NEI made at the Steering Committee
11 meeting, you know, we're also aware that there is
12 interest in providing feedback on the RIL. And, yes,
13 so we've talked internally about, when there is new
14 research that is available that will help understand
15 or expand the understanding of this phenomenon, we can
16 always revise the RIL to include whatever research is
17 going to be made available over the next several
18 years, especially with SCIP-IV.

19 The other thing that we did talk about is
20 that, beyond the RIL with the development of any kind
21 of regulatory guidance, there's always opportunities
22 for stakeholders to express their views and opinions
23 on whatever regulatory guidance may be developed as a
24 result of that.

25 Additionally, because this is such a high

1 visibility topic with industry, we have frequent
2 engagements with industry on topics such as this. And
3 I know that Joe Donoghue is leading the charge to plan
4 a high burnup workshop. So, that will be a public
5 engagement where NRC and the industry will make
6 presentations on various topics associated with high
7 burnup.

8 Additionally, there are technical meetings
9 between the staff and international counterparts,
10 including EPRI, where this topic will be discussed in
11 further detail.

12 So, I just wanted to put that kind of
13 wrapper around some additional notions of what's next.

14 CHAIRMAN SUNSERI: All right. Is that
15 concluding your remarks?

16 MS. BALES: Yes, at this point, the only
17 material that would kind of go into the technical
18 basis is if there are specific questions. But I think
19 all of the key points have been made in --

20 CHAIRMAN SUNSERI: I think you all
21 thoroughly did that during the Subcommittee remarks.

22 Okay. Good. Well, thank you. That was
23 very, very informative.

24 Ron, do you have other --

25 MEMBER BALLINGER: Yes, now we have NEI.

1 I think they're still on standby.

2 DR. CSONTOS: Yes, all set.

3 MEMBER BALLINGER: And Al is in.

4 Since we've gone a ways over, should we
5 take a five-minute break?

6 CHAIRMAN SUNSERI: We can take a five-
7 minute transition.

8 MEMBER BALLINGER: So, then, NEI get their
9 slides and --

10 CHAIRMAN SUNSERI: Yes, get their slides
11 up.

12 MEMBER BALLINGER: -- make sure everything
13 works?

14 CHAIRMAN SUNSERI: Yes, that would be
15 fine.

16 MEMBER BALLINGER: So, we'll take a five-
17 minute break.

18 CHAIRMAN SUNSERI: We'll resume at 10
19 after.

20 MEMBER BALLINGER: Yes, 10 after, five
21 more minutes, 4 minutes and 49 seconds.

22 (Laughter.)

23 CHAIRMAN SUNSERI: Did I read that wrong?
24 Okay, we'll make it 15 after then.

25 MEMBER BALLINGER: Make it 15.

1 CHAIRMAN SUNSERI: You know, there's three
2 clocks in here. Sorry.

3 Fifteen after.

4 MEMBER BALLINGER: Fifteen after.

5 (Whereupon, at 10:05 a.m., the
6 foregoing matter went off the record and went
7 back on the record at 10:15 a.m.)

8 CHAIRMAN SUNSERI: Hey, welcome back.
9 I will reconvene the ACRS meeting at this point
10 and I'll transfer it back to Member Ballinger,
11 who will go to the NEI presentation.

12 MEMBER BALLINGER: Thank you, Mr.
13 Chairman. Thank you, Mr. Chairman.

14 I guess we just turn it over to Al
15 Csontos and go with the presentation.

16 DR. CSONTOS: Okay. Can you hear me
17 okay?

18 MEMBER BALLINGER: We can. I can.

19 DR. CSONTOS: Okay. Thank you.

20 Yes, I wanted to say thank you to the
21 Committee for providing us this opportunity to
22 present our industry comments and perspectives on
23 the RIL.

24 CHAIRMAN SUNSERI: Keep going.

25 DR. CSONTOS: We're good?

1 CHAIRMAN SUNSERI: I'll silence.
2 Please hold on for me.

3 DR. CSONTOS: Good to go?

4 CHAIRMAN SUNSERI: Okay. All right.
5 Go ahead.

6 DR. CSONTOS: Okay. Thanks.

7 So, I just want to say thanks again
8 for providing the opportunity to provide our
9 comments and our perspectives on the RIL.

10 Really, the comments that we're going
11 to have here and the concern really is an echo of
12 both the Subcommittee and the full Committee
13 (audio interference) with the staff. Really,
14 it's we're rehashing much of the same questions
15 and comments that you have provided.

16 We will start with two slides on general
17 overarching comments, two slides or three slides on
18 specific technical comments. And these are just three
19 that we picked. We have numerous more comments that
20 we could provide, but in the time allotted, we thought
21 providing you these three specific comments would
22 suffice. Okay?

23 So, yes, we just heard the concerns of the
24 extension of the RIL to regulatory application. And
25 the industry agrees with that question. And we also

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 agree with the staff position in the SECY letter in
2 2015, 0148, with respect to the FFRD research not
3 indicating a need to require additional new
4 requirements in the 50.46 rulemaking.

5 And I just want to say that we heard the
6 concept of the foreword. That's a great -- you know,
7 I fully support the concept of the foreword. I do not
8 support the notion that we're going to write the
9 foreword, but folks are on to say no. We do not
10 anticipate -- we're hoping to see that ahead of time
11 as well, so we can comment on that.

12 But, really, ultimately, the bottom line
13 is that we believe there are significant benefits for
14 taking the time to consider and incorporate a broader
15 technical review and comment period, like other NRC
16 documents, NUREGs or similar to RIL-1101, which
17 provided multiple rounds of review and comment periods
18 from the broader technical community, including
19 industry technical experts.

20 In fact, yesterday, we got an email from
21 an international technical fuel expert asking how they
22 can provide comments to the RIL because of the concern
23 that we're going to highlight in the next slide, which
24 is the significant amount of conservatisms that they
25 see in the RIL. And so, we asked them to participate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 or to call into the meeting, but we're not sure if
2 they are, if they made it and will provide comments
3 here.

4 But, anyway, this is slide 3, and a bit
5 more general comment. As written today, the draft RIL
6 is a conservative application to certain thresholds
7 and models from specific datasets. And this draft RIL
8 may be incomplete, in the absence of appropriate
9 assessments of certainly the levels of conservatisms
10 and, also, to assess the complexity of the technical
11 topic. There just seems to be that there's an
12 excessive conservatism in the RIL.

13 Secondly, the RIL does not offer an
14 interpretation of the uncertainties or conservatisms
15 within the experimental database -- experiments using
16 nuclear heating versus experimental electrical (audio
17 interference) heating, for example.

18 And again, we just want to reiterate that,
19 per the past person I talked about, the RIL-1101, we'd
20 like to have an opportunity to provide our technical
21 comments prior to the publication, just the broader
22 technical consensus.

23 Next slide.

24 So, the specific examples now. We've
25 identified a couple of inconsistencies in the report,

1 and we thought we'd just highlight them here, and
2 maybe the staff can take a look at them and maybe
3 revise or do what they will with it.

4 But the RIL references Argonne National
5 Lab Test ICL No. 2 as a primary basis for establishing
6 the fragmentation critical pellet average burnup of 55
7 gigawatt days per MTU. And those tests, though, used
8 BWR, so the rod average burnup between 55 to 57, which
9 would imply higher local burnup throughout the middle
10 section of the rod. And we confirmed this through
11 email correspondence with Mike Malone, that that's
12 probably around 64, approximately 64. Okay?

13 So, figure 3 in the report shows two data
14 points near 60 gigawatt days per MTU with fine
15 fragmentation near zero. And those PWR rods were
16 tested within the FISA program, with a rod average of
17 55.2 gigawatt days per MTU, and showed no fuel loss
18 during the LOCA test.

19 The SCIP-III results at the segment formed
20 of 50 gigawatt days per MTU in figure 3 indicates a
21 relatively small degree of fine fragmentation compared
22 with the test with second burnup exceeding 65. The
23 specific test was a BWR rod. And while some smaller
24 fine fragments were observed, the majority of the
25 fragments were greater than 2 millimeters, contrary to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 figure 3 in the draft RIL. And in the SCIP-III
2 program, it states that 90 percent of the fragments
3 were larger than 1 millimeter.

4 So, based on the test data, the onset of
5 the measurable fine fragmentation -- so, the
6 conclusion could be altered based upon some of these
7 discussions of the dataset. And based on that test
8 dataset, the onset of measurable fine fragmentation
9 appears to be near 50, not 55. So, I just want to
10 bring that out to you.

11 Next slide.

12 So, the RIL states that the staff
13 recommends a model that will predict the mass of the
14 fuel dispersal to be -- you know, I don't want to read
15 it to you, but this approach right here we see as
16 having several unnecessary conservatisms. It ignores
17 the effect of the burst opening area. These are
18 comments, you know, in a lot of ways they're very
19 similar to the comments that were made by the ACRS
20 Subcommittee and full Committee, but we're going to go
21 into specifics there.

22 The burst area, you know, that's
23 demonstrated in SCIP-III shows a strong influence of
24 the amount of dispersed, but that goes to some of the
25 comments about the consequences. It ignores the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 effect of fragment size distribution, which has also
2 been demonstrated in SCIP-III to be important. And it
3 ignores the core-wide average in effect of individual
4 rod uncertainties in terms of the conduct of the fuel
5 dispersal analysis with respect to large, you know,
6 over 100 number of rods. And in this case, we're just
7 saying that these are more accurate ways to possibly
8 look into some of these areas.

9 Next slide.

10 And we wanted to highlight that there are
11 other interpretations of FFRD-related phenomena with
12 the same datasets. And so, here are three examples.
13 I remember in the Subcommittee there was a lot of
14 discussion about the Capps paper. We threw in two
15 more. Now these reports and these papers were cited
16 in the RIL, and they acknowledge the complexity of the
17 phenomena. Michelle just talked about the complexity
18 of the phenomena and the different database.

19 But the question here about going to
20 conservative interpretations with the draft RIL is
21 really, you know, it's limiting, we think, the benefit
22 and the value of the RIL.

23 So, last slide. You know, in summary,
24 three major points that we just want to make.

25 We believe this is a conservative

1 treatment of a highly complex technical topic. We
2 talked about this or the ACRS talked about this just
3 before me with Michelle's presentation. A lot of
4 dependencies.

5 We are concerned with the extension of
6 this draft RIL to regulatory application. The
7 foreword does help, but having a broader technical
8 consensus or a broader technical community review and
9 comment on the draft RIL, like the NRC did with the
10 RIL-1101, we think will provide benefits to NRC and
11 subsequent application to the regulatory domain by
12 providing a broader technical consensus and more
13 technical, I guess you could say robustness in terms
14 of getting the broader community to speak to it.

15 But, you know, I think I'll end up with I
16 think one of the ACRS members mentioned, asked the
17 question of why the rush. And I think that's what
18 we're wondering, too. And we would really like to see
19 about getting a broader consensus here by going
20 through at least a round of review of our comments to
21 be updated or to be revised in the current draft RIL,
22 because the RIL is still draft.

23 And that's our concluding remarks.

24 MEMBER BALLINGER: Thank you.

25 Let's see, how should we proceed? Should

1 we have a little period of Q&A from the Committee?

2 CHAIRMAN SUNSERI: We do, but I don't want
3 to overlook the public comments.

4 MEMBER BALLINGER: Yes, I'm just trying to
5 -- which comes first? Maybe we should have public
6 comments first?

7 CHAIRMAN SUNSERI: I think we should call
8 for public comments now.

9 MEMBER BALLINGER: Okay. I'm assuming
10 that there are people listening, and that if they
11 would like, if the members of the public would like to
12 make a comment, is it still *6?

13 CHAIRMAN SUNSERI: *6.

14 MEMBER BALLINGER: *6, and make your
15 comment, please. There's a lot of phone numbers
16 there.

17 CHAIRMAN SUNSERI: So, just let me restate
18 that clearly. Members of the public, if you wish to
19 make a comment, you can do so at this time by unmuting
20 your line and using *6, state your name, and provide
21 your comment.

22 Additionally, if you like, you can send us
23 written comments as well. Send them to the Designated
24 Federal Officer, Zena Abdullahi.

25 (Pause.)

1 Any comments?

2 (No response.)

3 All right. That's the public.

4 I would also extend the courtesy to
5 anybody on the Teams invite, if they want to make a
6 comment.

7 (No response.)

8 All right. I'm not hearing any. So, Ron,
9 I guess you can take it back and facilitate any
10 questions from the Committee now.

11 MEMBER BLEY: Yes, I have a question about
12 process, I guess. I'm definitely unfamiliar with the
13 RIL, and we have never, as far as I can remember, had
14 a presentation of a RIL before the Committee. I don't
15 think so.

16 MEMBER BALLINGER: That's --

17 MEMBER BLEY: Am I wrong?

18 MEMBER BALLINGER: Yes.

19 (Laughter.)

20 MEMBER BLEY: Well, I'm sometimes wrong,
21 but never in doubt.

22 MEMBER BALLINGER: But that's not really
23 relevant to our discussion.

24 MEMBER BLEY: Okay, but another part of
25 this might be that, were this to be used to produce a

1 guidance document, would the review process by the
2 public comment process of a guidance document, would
3 that be one way to do it? I mean, what Al is
4 proposing is that you have, in effect, a review
5 process of a RIL. I'm just curious.

6 MEMBER HALNON: One thing, I'm concerned
7 if you get to the guidance portion, we're so far down
8 the road that --

9 MEMBER BLEY: Yes.

10 MEMBER HALNON: -- to effect a significant
11 change or eliminate the guidance is going to be almost
12 difficult. There's got to be something before that.

13 And, Kim, you mentioned a lot of
14 interactions, but it sounded like they were kind of
15 anecdotal interactions as opposed to physically, I
16 mean specifically on this RIL and the conclusions, you
17 know, interim conclusions being made by the RIL.

18 MS. WEBBER: Yes. So, the interactions
19 that I was speaking about are really to talk about the
20 information in the RIL in a public setting. So,
21 that's the intent of the public interactions as we
22 envision them today.

23 I don't know if that clarifies your --

24 MEMBER HALNON: Do you see a GSI coming
25 down the road from this? Or is it too early to tell?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 MS. BALES: So, I didn't mention it in
2 this presentation, but there was a Generic Issue
3 Opinion for fuel dispersal sort of in parallel with
4 the rulemaking activity. And there was --

5 MEMBER HALNON: That's 50.46(c)?

6 MS. BALES: Correct. Sorry. A 50.46(c)
7 rulemaking. And the disposition of that was closely
8 linked to 50.46(c). So, that's sort of a different
9 subject, whether that conclusion would still be valid.
10 But it was already envisioned that this could be
11 something that needed to be addressed and --

12 MEMBER HALNON: So, that GS is still open
13 then?

14 MS. BALES: It's been closed, based on, at
15 the time, plans with the rulemaking.

16 MEMBER HALNON: So, I guess I would
17 encourage some specific discussion, since this has got
18 such wide-ranging impact down the road. And it sounds
19 like the industry is coming in with kind of an
20 opposing view, saying that we can go bigger. You're
21 saying we can go smaller. You know, it's he says; she
22 says at this point, but somewhere we've got to come to
23 a meeting of the minds, so there's not a lot of
24 resources wasted on both sides trying to get a limit
25 that no one is going to be able to buy into because of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 incomplete information.

2 MS. BALES: So, there's a lot of ways that
3 we can answer the question. I think what I'd say is
4 that the RIL is a summary of existing information.
5 Should new information become available, especially
6 information that contradicts or expands the limits in
7 a different direction, we would have to review the
8 RIL.

9 Without new information, if it's really
10 just a matter of interpreting and discussing how to
11 view the existing information, I think that that is a
12 totally valid thing to happen within the guidance
13 development process. The guidance development process
14 with public meetings and public comment periods would
15 allow for that interaction.

16 I don't think that the existence of the
17 RIL and statements in the RIL would overly restrict
18 the discussion that could come from a guidance.
19 Because, really, in guidance, you start to examine how
20 the information will be applied; where uncertainties
21 would be treated.

22 And so, I think one of the reasons that
23 it's convenient to use a RIL is there is some
24 flexibility in the process. I mentioned that ACRS is
25 not required; peer review is not required. In this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 case, we elected to do both because we felt that that
2 was something that would enhance the value of the RIL.

3 So, I don't want to say that, you know,
4 it's a really rigid process, but it's something that
5 we should understand where fits in this bigger
6 picture, and guidance has its own process that allows
7 for some interaction that I think is what industry is
8 pointing to, the need to understand how it's applied.

9 MEMBER HALNON: Okay.

10 MS. BALES: I'm not sure that going into
11 the RIL and massaging what it says is really going to
12 get there.

13 MEMBER HALNON: Yes. No, I'm not
14 suggesting changing the RIL, because you're right, it
15 is what it is from the standpoint of the data. The
16 foreword that you write, though, should probably
17 recognize that whenever you put a number out there, it
18 gets legs --

19 MS. BALES: Uh-hum.

20 MEMBER HALNON: -- and it tends to start
21 becoming normal language to people, and it becomes now
22 a brighter and brighter line that's impossible to
23 cross because it's out there.

24 MS. BALES: Uh-hum.

25 MEMBER HALNON: So, I would suggest that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

1 the foreword be very specific to that point, that this
2 is not meant at this point to be any kind of
3 regulatory limit or suggest a limit or, you know, be
4 used going forward with guidance without additional
5 information, whatever the -- your language, not mine.
6 But I'm just concerned that, you know, having it -- we
7 all love a number.

8 MS. BALES: Yes.

9 MEMBER HALNON: We all love bright lines,
10 and we tend to equate those two together when we see
11 it.

12 MS. BALES: Yes.

13 CHAIRMAN SUNSERI: Any other member
14 comments, questions?

15 MEMBER BALLINGER: Other comments?

16 MEMBER PETTI: Yes, just one. I was a
17 little concerned on the NEI's technical comment about
18 the burnup. I think we should run that through Al.

19 When I first saw the 55, what struck me in
20 Subcommittee was it's based on a photomicrograph.
21 That's all we have. But it sounds like there's more
22 than that. There's no quantitative, because it was
23 done, I guess, a while ago, before, let's say, we had
24 the protocols in place that they have now for SCIP
25 and --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 MS. BALES: Right. So, I agree with you
2 that -- you know, I saw that comment this morning and
3 looked up in the NUREG, and we need to clarify that in
4 the RIL because it is accurate to say that the value
5 for that was the right average, where the rest of the
6 reported results are segment averages.

7 What I'll say, though, is a few points.
8 One, SCIP-IV is looking at the range between 40 and 60
9 because there's so little data --

10 MEMBER PETTI: That was my other question.
11 So, great.

12 MS. BALES: Yes. No, it's something that,
13 I mean, the whole SCIP community has been scrutinizing
14 these results, too, and recognizes that we really
15 don't have a good picture of the transition because
16 our last known fine fragmentation is at 45, and then,
17 we don't get anything until 60 in some cases that
18 there has been fragmentation observed.

19 And you're right that the SCIP protocol
20 quantifies the fragment size and micrograph does not.
21 And that makes it a mismatch in the robustness of
22 that, to anchor the point. But I expect that, with
23 SCIP-IV data, we'll learn more.

24 But, also, the trendline that we would
25 have drawn, if we only had the SCIP data, would have

1 intersected at 55 anyway. Because, as I said, where
2 we know that there was no fine fragmentation was at
3 45, and then, at 60, there was already some. It was
4 small, but there was some. And so, it's somewhere
5 below 60.

6 MEMBER PETTI: That's probably worth a
7 footnote in the document, I think. You know, that,
8 hey, if you take that out, you're --

9 MS. BALES: No, I think that that's --
10 yes.

11 MEMBER PETTI: That's all.

12 MS. BALES: Yes.

13 CHAIRMAN SUNSERI: Anybody else?

14 (No response.)

15 All right.

16 MEMBER BALLINGER: No others? Okay, I'll
17 turn it back to you.

18 CHAIRMAN SUNSERI: Well, okay. Thank you,
19 Ron. Thank you, Staff. Thank you, NEI, for the
20 presentations. I found them to be all informative.
21 I think the Committee did as well, based on the
22 questions I heard asked here. So, thank you for
23 taking the time to put that together.

24 So, at this point, we do have a draft
25 report letter, a letter report, that we are preparing.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1716 14th STREET, N.W., SUITE 200
WASHINGTON, D.C. 20009-4309

(202) 234-4433

www.nealrgross.com

1 And I'd ask Ron, if you want to pull that up, we'll do
2 an initial read-through and see if we can get
3 Committee major comments on that. We can go to 11:00,
4 maybe a little after, but not much more.

5 MEMBER BALLINGER: That's fine.

6 (Whereupon, at 10:37 a.m., the Advisory
7 Committee went into closed session.)

The outcome of the RIL

The basis for empirical thresholds included in the RIL

Other Matters

Why a RIL?

Research Information Letters

Research Information Letters (RILs) are documents issued by the NRC's Office of Nuclear Regulatory Research to the NRC regulatory and regional offices that summarize, synthesize, and/or interpret significant research information relevant to a given technical area, provide new or revised information, and discuss how that information may be used in regulatory activities. RILs can improve regulatory efficiency and effectiveness by providing important, pertinent information in a timely, concise, and comprehensive summary.

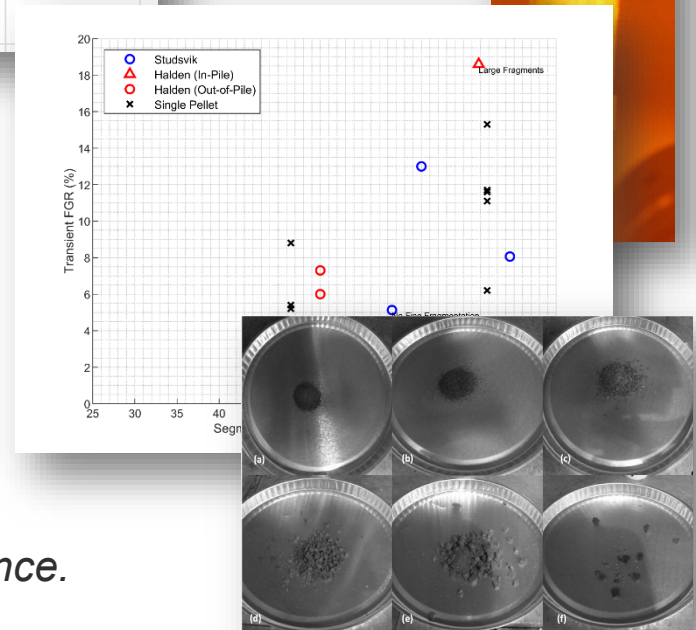

If you have questions about a RIL, please [contact us](#) for assistance.

2000s:	2021							
	2020	2019	2015	2014	2013	2012	2011	2009
	2008	2007	2006	2004	2003	2002	2001	

RILs have been used in the fuel's area:

- [RIL-0401](#), “An Assessment of Postulated Reactivity-Initiated Accidents (RIAs) for Operating Reactors in the U.S.”
- [RIL-0801](#), “Technical Basis for Revision of Embrittlement Criteria in 10 CFR 50.46”

A Research Information Letter does not provide guidance.

FFRD history at NRC

- [RIL 2008-01](#), “Technical Basis for Revision of Embrittlement Criteria in 10 CFR 50.46”
- [NUREG-2121](#), “Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident”
- [SECY-15-0148](#), “Evaluation of Fuel Fragmentation, Relocation and Dispersal under Loss-of-Coolant Accident (LOCA) Conditions Relative to the Draft Final Rule on Emergency Core Cooling System Performance during a LOCA (50.46c)”
- RIL 2021-13, “Interpretation of Research on Fuel Fragmentation, Relocation, and Dispersal at High Burnup”

This presentation will address...

FFRD history at NRC

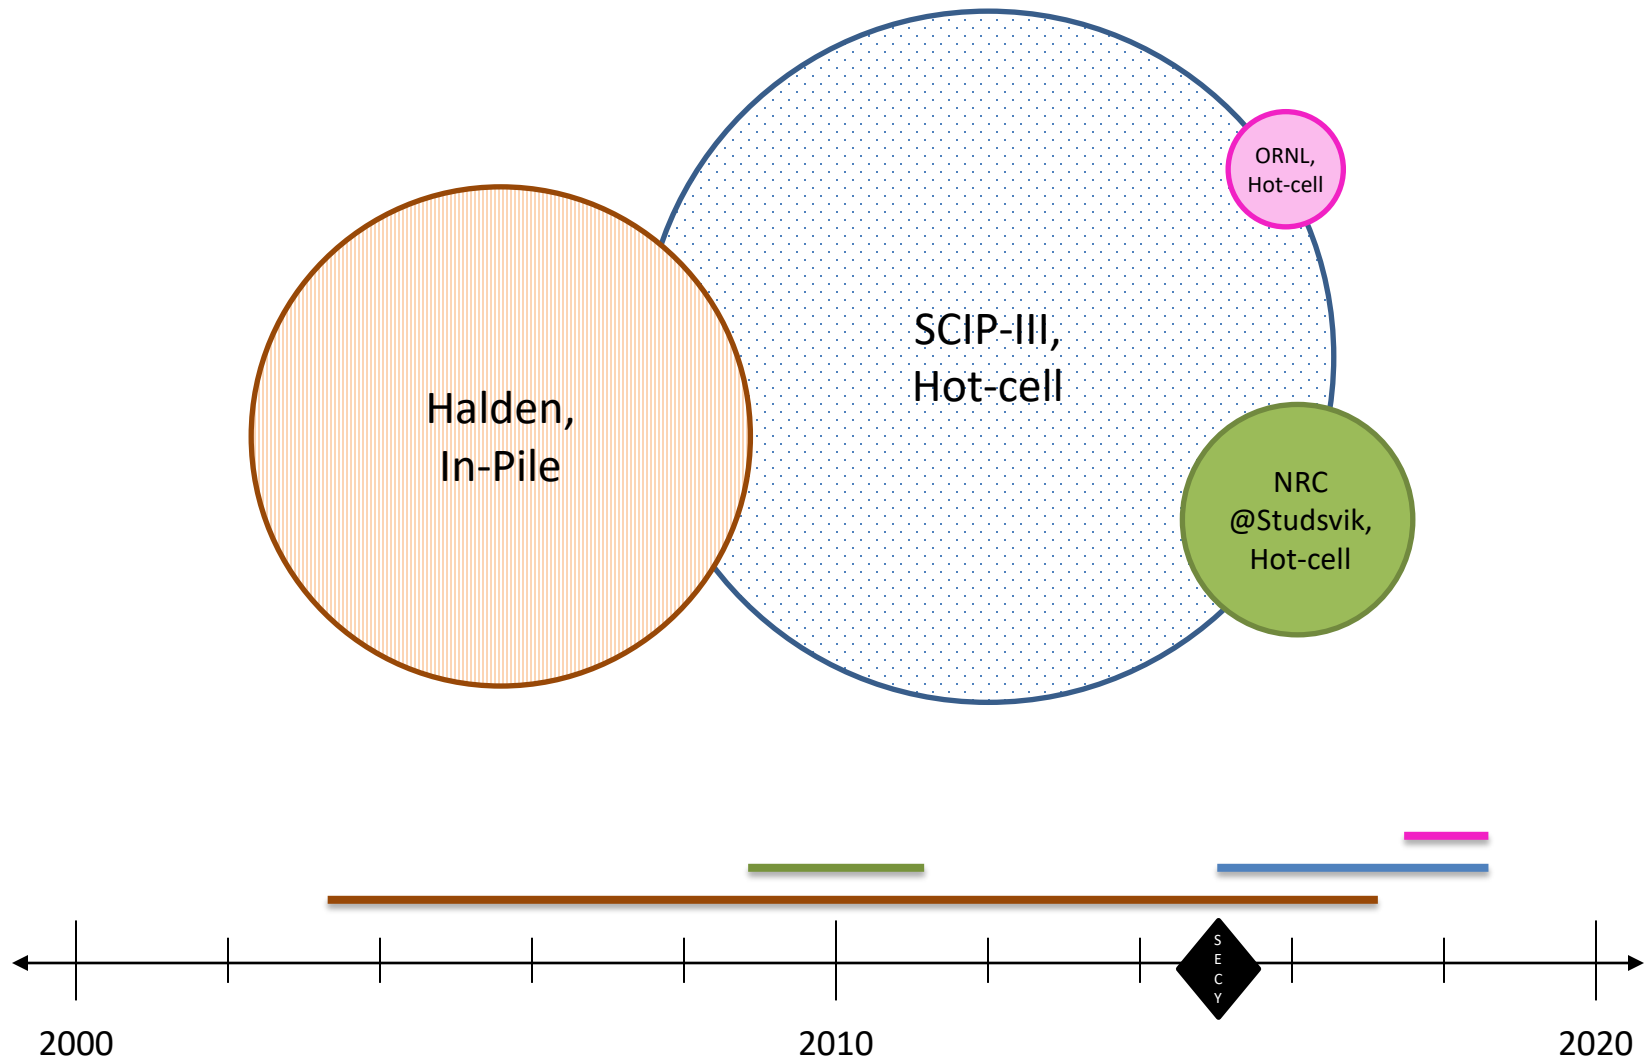

The programs cited in the RIL and the peer reviewers used

The outcome of the RIL

Other Matters

Data Sources for RIL

Peer Review Group

- Ad hoc, issue-focused group. Reviewers selected with extensive familiarity of FFRD research
 - *Nathan Capps, ORNL* – Author of two significant publications on FFRD, extensive experience modeling aspects of FFRD and collaborator in ORNL FFRD experimental program
 - *Tatiana Taurines, IRSN* – Extensive experience modeling aspects of FFRD and leader in SCIP program review group discussions
 - *Fabiola Cappia, INL* – Collaborator in FFRD publications, lead for INL PIE campaigns of HBU fuel, extensive work examining evolution of fuel microstructure with burnup
 - *Ken Yueh, EPRI* – Designed and led FFRD research campaigns at Studsvik for EPRI and NSUF at ORNL/INL, leader in SCIP program review group discussions
 - *Daniel Jädnäs, Studsvik* – Collaborator in SCIP experimental design and expert in SCIP results

This presentation will address...

FFRD history at NRC

The programs cited in the RIL and the peer reviewers used

The outcome of the RIL

The basis for empirical thresholds included in the RIL

Other Matters

Hot-cell testing to simulate Loss-of Coolant Accident condition

Influence of experimental methods

Empirical limits are derived in such a way to be independent of any experimental non-prototypicalities.

Outcome of the RIL: *Identify when FFRD occurs*

Segment from NRC's ANL LOCA program at 55
GWd/MTU before and after testing

Outcome of the RIL:

Identify when FFRD occurs

Address five elements of the RES staff's interpretation of FFRD research and describe the technical basis for these elements:

1. Fine fragmentation threshold
2. Fuel relocation threshold
3. Model to quantify dispersal
4. Document *transient* fission gas release
5. Quantify packing fractions in the balloon region

Outcome of the RIL:

Identify which rods are a concern for FFRD

For the **dispersal** zone, some core loadings may result in no region of overlap

Overlap
influenced by:

- ECCS response
- Plant design
- Loading pattern
- Fuel and cladding design

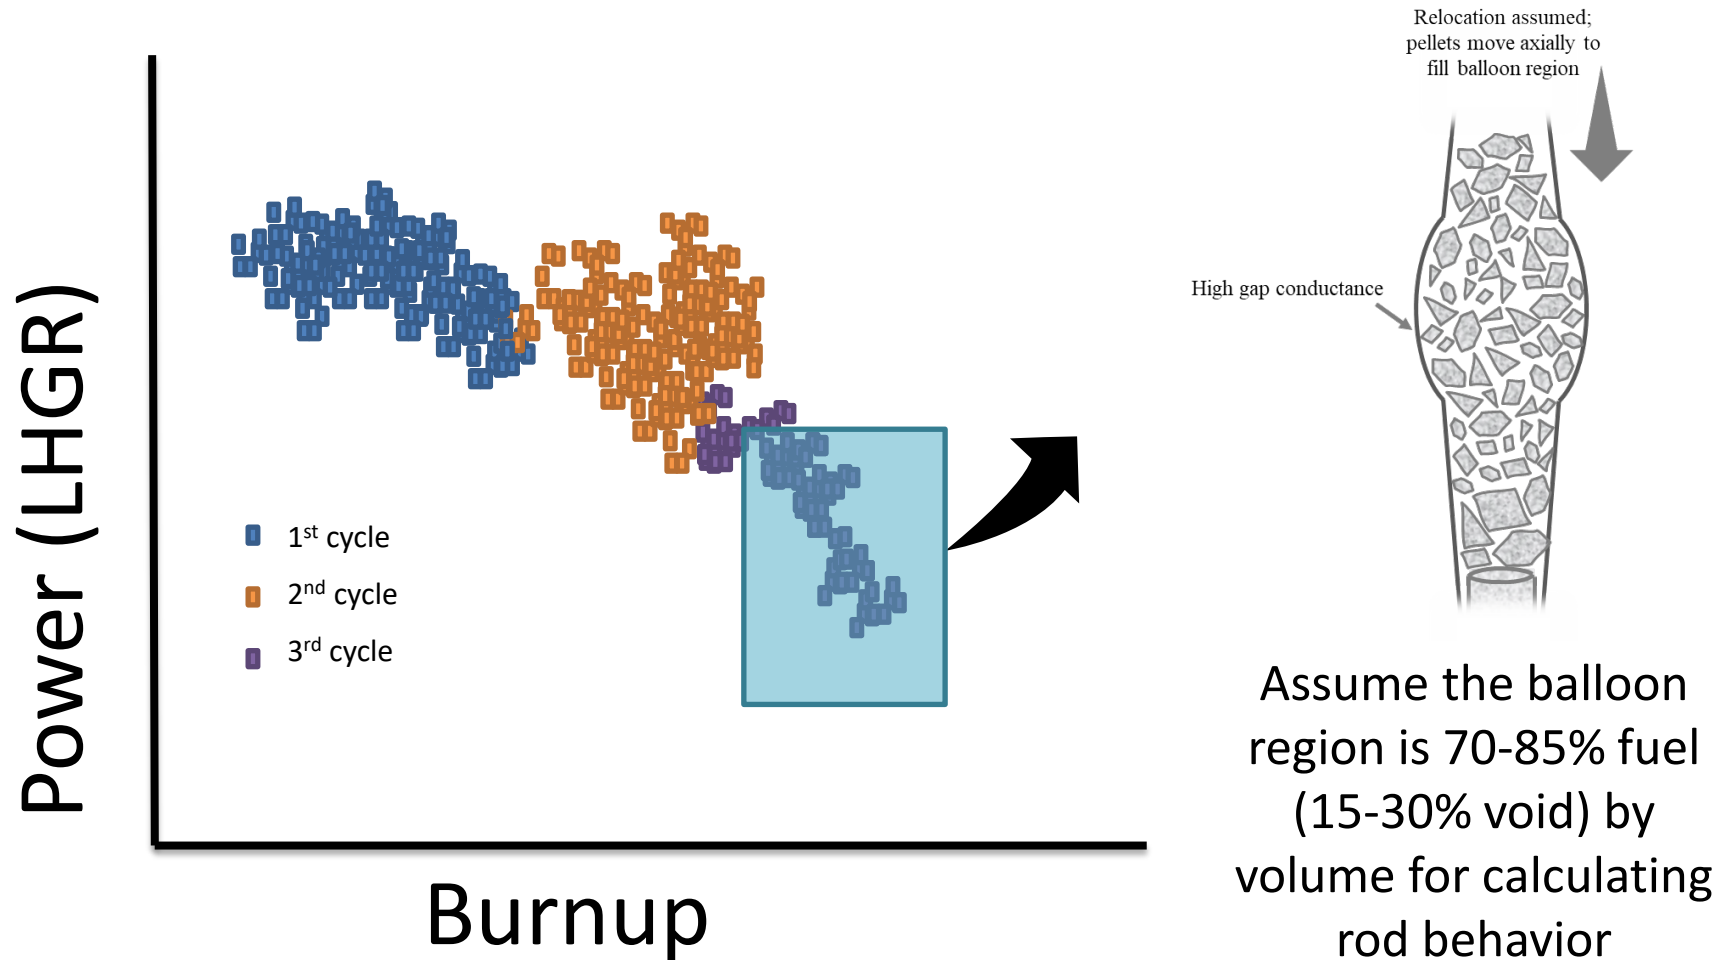

This information is prototypical of PWR. BWR's will have few if any rods susceptible to dispersal due to different operating practices, system pressure, etc.

Transient Fission Gas Release - Increasingly important at higher burnup; Important to accurately predict burst

Relocation **packing fraction** - Important to accurately predict burst and peak temperature for non-burst high burnup rods

The RIL supports targeted FFRD analysis

- Fine fragmentation
 - Not seen below 55 GWd/MTU
- Fuel axial relocation
 - Not seen in cladding with less than 3% strain
- Fuel dispersal
 - Fine fragmentation and relocation are prerequisites; Therefore, dispersal requires burnup > 55 GWd/MTU, strain > 3%
 - Doesn't happen unless there's rupture
- Transient Fission Gas Release
 - Increasingly important at higher burnup
- Relocation packing fraction
 - Important for non-burst high burnup rods

This presentation will address...

FFRD history at NRC

The programs cited in the RIL and the peer reviewers used

The outcome of the RIL

The basis for empirical thresholds included in the RIL

Other Matters

Element 1: Empirical threshold at which fuel pellets become susceptible to fine fragmentation

Segment from NRC's ANL LOCA program at 55 GWd/MTU before and after testing

Research supports a pellet-average burnup limit of **55 GWd/MTU** as the **onset of fine fuel fragmentation**

Element 2: A local cladding strain threshold below which relocation is limited

NRC test #	Strain threshold, top (%)	Strain threshold, bottom (%)
189	6.0	3.0
191	6.0	4.0
192	5.0	4.0
193	1.0	4.0
196	3.0	5.0
198	4.5	9.0

Research suggests **fuel relocation is limited** in regions of the fuel rod experiencing **less than 3% cladding strain**.

Element 3: A conservative value for the mass of “dispersible” fuel as a function of burnup

What do dispersal measurements look like?

Dispersal
“during the
test”

Element 3: A conservative value for the mass of “dispersible” fuel as a function of burnup

What do dispersal measurements look like?

Dispersal
“during
shaking”

Element 3: A conservative value for the mass of “dispersible” fuel as a function of burnup

Element 3: A conservative value for the mass of “dispersible” fuel as a function of burnup

	Difference between dispersal predicted by the model and all mobile fuel observed in the experiment	
SCIP test	Mass (g)	Prediction/Measured
OL1L04-LOCA-2	125	250%
N05-LOCA	-19	76%
VUR1-LOCA-1	15	109%
WZR0067-LOCA	-16	83%
VUL2-LOCA1	-7	94%
VUL2-LOCA3	8	105%
VUL2-LOCA4	5	102%

Recommend a model to predict the mass of fuel dispersal to be all fuel above the **burnup threshold of 55 GWd/MTU** in the length of the rod with **greater than 3% cladding strain** to disperse.

Element 4: Provide evidence of significant tFGR that may impact ballooning and burst behavior of high burnup fuel under LOCA conditions

Data shows increasing transient fission gas release with burnup. However, many other factors besides burnup impact tFGR (e.g., fuel temperature, stresses in fuel). Licensees will need to address tFGR in their LOCA evaluation models. Some models exist for tFGR, but more validation of those models is needed.

Element 5: Establish a value for the packing fraction of relocated but non-dispersed fuel in the balloon region

It is reasonable to use packing fraction values between 70 to 85 percent for fuel susceptible to fine fragmentation. (Fuel at lower burnup would likely have a lower packing fraction).

To determine the impact on ballooning and burst, it is important to examine a range of packing fractions to account for these effects.

This presentation will address...

FFRD history at NRC

The programs cited in the RIL and the peer reviewers used

The outcome of the RIL

The basis for empirical thresholds included in the RIL

Other Matters

Discussion of Consequences and Consequence Modeling

- Refers to SECY-15-0148 and NUREG-2121
- Reiterates potential safety concerns associated with FFRD:
 - energetic fuel-coolant interactions
 - recriticality of dispersed fragments
 - core coolability and long-term decay heat removal
 - radiological impacts, including control room dose and equipment qualification*

** Being addressed outside of the RIL, as part of an update to Regulatory Guide 1.183, "Alternative Radiological Source Terms for Evaluating Design Basis Accidents at Nuclear Power Reactors."*

Limitations of the Empirical Database

- Limits are not applicable to doped fuel or coated cladding.
 - Additional research could demonstrate that the limits in the RIL apply or are bounding
 - Note doped fuels have different FGR behavior, so it would be important to understand implications on FFRD
 - Note coated claddings have been shown to have less strain and smaller burst openings, which could mean better performance with respect to FFRD

Limitations of the Empirical Database

- Limits are simplistic, derived as a function of burnup only.
 - Burnup is likely a surrogate for more direct variables such as porosity, stresses within the fuel pellet, grain growth and subgrain formation. These features are likely influenced by operating history
 - Additional research to allow for more mechanistic treatment of these variables could allow for refinement of the limits
- Limits anticipate accurate prediction of cladding strain along the axial length of a fuel rod. Burst opening size is presumed to be stochastic and therefore limits assume large opening size.
 - Additional research to validate balloon height, axial strain profile and burst opening could allow for refinement of the limits

What's next?

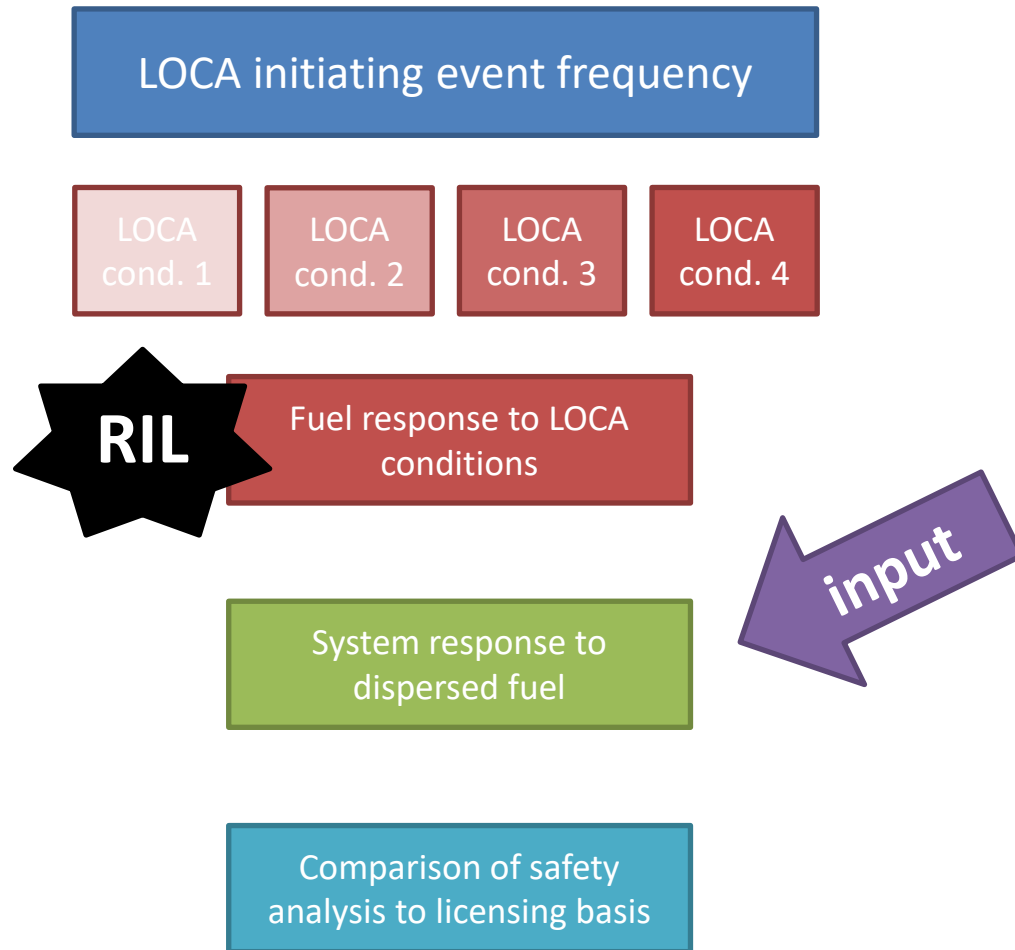

- Participating in SCIP IV
 - Includes testing of non-standard fuel
 - Additional testing to characterize tFGR
 - Testing in the mid-level burnup range
- Refining analysis tools to improve core-wide FFRD analysis
 - Building from 2015 and MELLLA+ experience
 - Enhancing resolution and realism
 - Utilizing new modeling features

What's next?

- RIL will establish foundation for next steps
 - Industry can build from the RIL based on their licensing needs, justifying design specific limits
 - Researchers can build programs from the RIL that produce the information needed to go further

RIL in context
