Docket No. 50-270
Renewed License No. DPR-47

Subject: Oconee Unit 2, Refuel 30 (O2R30) Steam Generator Tube Inspection Report

In accordance with Oconee Nuclear Station (ONS) Technical Specification 5.6.8, "Steam Generator Tube Inspection Report," a steam generator inspection report is being provided pertaining to the 30th refueling outage for ONS, Unit 2 (O2R30).

The Enclosure to this letter contains the steam generator inspection report for O2R30.

This submittal contains no regulatory commitments. Please refer any questions regarding this submittal to Lee Grzeck, Manager – Nuclear Fleet Licensing (Acting), at 980-373-1530.

Sincerely,

Oconee O2R30 Steam Generator Tube Inspection Report

Pursuant to Oconee technical specification 5.6.8 the following information is provided:

a. The scope of inspections performed on each SG

The scope of the inspection performed on both 2A and 2B steam generators (SG) included 100% of the in-service tubes in each Replacement Once Through Steam Generator (ROTSG). All in-service tubes were inspected with bobbin probe.

Array probe inspection was performed in both steam generators of the periphery tubes five (5) tubes deep up to the 1st support plate.

Special Interest (array coil) inspections were also performed on selected indications.

All plugs were visually inspected.

A visual inspection of the bowl cladding was performed.

b. Degradation mechanisms found

Tube wear at support plate locations, from a presumed foreign object, and from tube-to-tube contact were the only degradation mechanisms found.

c. Non-destructive examination techniques utilized for each degradation mechanism

The Non-destructive examination techniques utilized bobbin coil for the detection of tube wear. The array probe was utilized to characterize selected wear indications and was used to size the presumed foreign object wear and tube-to-tube contact wear.

d. Location, orientation (if linear), and measured sizes (if available) of service induced indications.

The complete listing for service induced indications is attached.

A total of 10,701 indications of tube support plate (TSP) wear were identified in 5,603 tubes in the 2A SG. A total of 9,278 indications were identified in 4,938 tubes in the 2B SG. The number of indications increased in both SG. The largest indication observed was 50% TW. The average and 95/50 growth rate are shown below.

<i>Tube Support Plate Wear Growth Rates</i>				
	<i>2A SG</i>		<i>2B SG</i>	
	<i>EOC-30</i>	<i>EOC-29</i>	<i>EOC-30</i>	<i>EOC-29</i>
<i>Average growth rate (% TW)</i>	0.6	0.4	0.4	0.4
<i>95/50 growth rate (%TW)</i>	2.1	2.1	2.1	2.6

A total of twenty-one (21) indications of wear at the fourteenth (14th) TSP drilled-hole locations were identified in twenty (20) tubes in the 2A SG. A total of fifty (50) indications in forty-six (46) tubes were identified in the 2B SG. The number of indications increased in the 2B SG. The largest indication observed was 32% TW. The average growth rate observed during Cycle 30 was 1.1%TW per EFPY.

During the EOC-30 outage, historical tube-to-tube wear that had been inspected at least three previous times with array were assigned an HNC (Historical No Change) code, provided there was no

change in the bobbin signal. There were 33 HNC indications associated with tube-to-tube wear in 2A SG and 24 HNC indications associated with tube-to-tube wear in 2B SG. These indications were not depth sized since they previously had ample margin to the structural integrity performance criteria and there has been no change in the bobbin signals.

Bobbin flaws that had been previously reported but didn't meet the HNC criteria were reported as TTW (Tube-to-Tube Wear). Bobbin flaws of possible tube-to-tube wear that hadn't been previously reported were reported as ADI (Absolute Drift Indication). There were 16 TTW indications and 1 ADI indications. All bobbin TTW and ADI locations were inspected with array probes. From the array inspections there were 6 indications in 6 tubes in 2A SG and 12 indications in 10 tubes in 2B SG. Note that the ADI indication was not confirmed with array and two of the TTW locations had multiple indications from the array probe. There were no newly reported Array indications.

There was one (1) indication of presumed foreign object wear detected in 2A SG slightly above the 13th support and one (1) foreign object wear with a possible loose part (PLP) present in SG2B at the lower tubesheet. The maximum depth reported was 13%TW and 12 %TW respectively.

e. Number of tubes plugged during the inspection outage for each degradation mechanism

Twenty-five (25) tubes were plugged in the 2A SG; all plugged were due to wear. Twenty-seven (27) tubes were plugged in the 2B SG: twenty-three (23) were plugged due to wear. The remaining four (4) were plugged due to a presumed foreign object with wear at the top of tubesheet (TTS). The following is a list of tubes plugged in EOC-30.

The effective plugging percentage is 0.67% in 2A SG and 0.90% in 2B SG.

- g. **The results of condition monitoring, including the results of tube pulls and in-situ testing.**

The cumulative SG EFPY for EOC-27 was 10.56, EOC-28 was 12.51, EOC-29 was 14.45 and EOC-30 was 16.37.

As of EOC-30, the Oconee Unit 2 steam generators had operated 15.03 EFPY since the first in-service inspection after replacement. In total, the Oconee Unit 2 steam generators had operated 16.37 EFPY since replacement.

Condition Monitoring structural and accident induced leakage integrity was demonstrated for tapered, flat, drilled support, tube-to-tube contact and presumed foreign object wear.

An NDE maximum depth call of 69.4 %TW or less for tapered wear is sufficient to demonstrate a minimum degraded tube burst pressure of 3ΔP, 4125 psi, at 0.95 probability with 50% confidence using a ratio of structural to maximum depth of 0.87 and structurally effective length of 0.4 inches.

To justify the continued use of the depth ratio and structural length, eleven of the deeper indications in the tapered wear regions were line-by-line sized using the array inspection results. All 11 of these indications were tapered. The ratio of structural to maximum depth ranged from 0.81 to 0.890 with an average of 0.87, consistent with previous results. The structural lengths ranged from 0.23" to 0.51" with an average of 0.34", also consistent with previous results.

Since some of the flaws had structural lengths that were longer than the 0.4" value used in previous analyses, these indications were conservatively evaluated using the flaw shape parameters and the corresponding condition monitoring limits for a flat flaw of 54.9%TW. These shape parameters include a depth ratio of 1.0 and a structural length of 0.8 inches

The limiting flaw had a maximum depth of 50%TW from the bobbin coil inspection. This flaw had a depth ratio of 0.86 and a structural length of 0.36 inches. Applying the depth ratio to the maximum depth yields a structural bobbin depth of 43%TW (50 x 0.86). Since the structural depth of the limiting flaw was less than 54.9%TW and the structural length was less than 0.8 inches, condition monitoring structural integrity was demonstrated for tapered wear.

Wear with a relatively flat profile (uniform depth) occurs in the inspection port regions of both generators. An NDE maximum depth call of 54.9 %TW or less for flat wear is sufficient to demonstrate a minimum degraded tube burst pressure of 3ΔP, 4125 psi, at 0.95 probability with 50%

confidence. The maximum flat wear depth seen in either steam generator was an NDE depth of 32 %TW.

A small population of shallow wear indications was observed during Oconee 2EOC29 at drilled hole locations at the 14th support plate. The deepest of these indications was 32%TW with a circumferential extent of 80° and an axial length of 0.56 inches. This is much less than the condition monitoring structural limit of 47.1 %TW (based on axial pull test of a 54%TW maximum depth circumferential slot with a circumferential extent of 0.98 inches (180°)). It is also much less the pressure loading condition. To address the pressure loading condition, the condition monitoring limit was calculated using the burst pressure equation for 360 degrees thinning with limited axial extent. These results show that, for a uniform thinning flaw with a bounding axial extent equal to the thickness of the TSP (1.5 inches), the condition monitoring limit is 48.7%TW

There were 18 tube-to-tube wear indications that didn't meet the HNC criteria. These indications were inspected and sized with array. The deepest of these indications measured 11%TW. The maximum axial extent was 8.23 inches. All the array indications had circumferential extents of 27 degrees. Two tubes had two such indications in the same plane, thus giving a total circumferential extent of 54 degrees. Since the maximum depth recorded for these indications was 11%TW and the maximum axial length and circumferential extent were less than 20 inches and 135 degrees respectively, condition monitoring structural integrity was demonstrated for the preceding cycle for this mechanism. The condition monitoring limit is 52.4%TW.

Two indications of presumed foreign object wear were detected, one in each SG. These indications were depth sized with array. The condition monitoring limit was calculated using the burst pressure equation of Section 5.3.3 of the EPRI Steam Generator Degradation Specific Management Flaw Handbook for a foreign object wear scar with a worst case assumed axial length of 1.5 inches and circumferential extent of 135 degrees. The resulting condition monitoring limit is 51.5%TW. Since the maximum recorded depth for presumed foreign object wear was 13%TW and the axial and circumferential extents were 0.35 inches and 53 degrees, respectively, condition monitoring structural integrity was demonstrated for the preceding cycle for this mechanism.

No degradation was detected in the plug visual or bowl cladding inspections.

No in-situ tests or tube pulls were performed.

No secondary side work was performed.
