Oconee Nuclear Station, Unit 3
Docket No. 50-287
Renewed License No. DPR-55

Subject: Oconee Unit 3, Refuel 31 (O3R31) Steam Generator Tube Inspection Report

In accordance with Oconee Nuclear Station (ONS) Technical Specification 5.6.8, "Steam Generator Tube Inspection Report," a steam generator inspection report is being provided pertaining to the 31st refueling outage for ONS, Unit 3 (O3R31).

The Enclosure to this letter contains the steam generator inspection report for O3R31.

This submittal contains no regulatory commitments. Please refer any questions regarding this submittal to Ryan Treadway, Director – Nuclear Fleet Licensing, at 980-373-5873.

Sincerely,

A handwritten signature in black ink, appearing to read 'KME', with a large, sweeping flourish extending to the right.

Oconee O3R31 Steam Generator Tube Inspection Report

Pursuant to Oconee technical specification 5.6.8 the following information is provided:

a. The scope of inspections performed on each SG

The scope of the inspection performed on both 3A and 3B steam generators (SG) included 100% of the in-service tubes in each Replacement Once Through Steam Generator (ROTSG). All in-service tubes were inspected with bobbin probe.

Array probe inspection was performed in both steam generators of the periphery tubes five (5) tubes deep up to the 1st support plate.

Special Interest (array coil) inspections were also performed on selected indications.

All plugs were visually inspected.

A visual inspection of the bowl cladding was performed.

b. Degradation mechanisms found

Tube wear at support plate locations and from tube-to-tube contact were the only degradation mechanisms found.

c. Non-destructive examination techniques utilized for each degradation mechanism

The Non-destructive examination techniques utilized bobbin coil for the detection of tube wear. The array probe was utilized to characterize selected wear indications and was used to size the tube-to-tube contact wear.

d. Location, orientation (if linear), and measured sizes (if available) of service induced indications.

The complete listing for service induced indications is attached.

A total of 16,875 indications of tube support plate (TSP) wear were identified in 8,110 tubes in the 3A SG. A total of 8,739 indications were identified in 5,168 tubes in the 3B SG. Although the average growth rates have slowed since the first few operating cycles, the quantities of indications have generally continued to increase. The largest indication observed was 50% TW. The average and 95/50 growth rates are shown below.

Tube Support Plate Wear Growth Rates				
	3A SG		3B SG	
	EOC-31	EOC-29*	EOC-31	EOC-29*
Average growth rate (% TW)	0.4	0.4	0.4	0.5
95/50 growth rate (%TW)	1.8	2.1	1.6	2.6

**=Previous results were resized with the fixed curve*

As discussed in the Oconee O2R29 report (ADAMS Accession No. ML20070H575), subsequent request for additional information letter response (ADAMS Accession No. ML20170A475), and the NRC review of the report (ADAMS Accession No. ML 20192A321), there were two changes made that were also implemented in O3R31 that affected the depths and quantities of the TSP wear indications reported. One of these changes was the implementation of a fixed curve for the bobbin depth sizing and the other change was made to the depth reporting threshold.

A total of four (4) indications of wear at the fourteenth (14th) TSP drilled-hole locations were identified in four (4) tubes in the 3A SG. A total of two (2) indications in two (2) tubes were identified in the 3B SG. The average growth rate of these indication was 1.1%TW/EFY. All of these indications were confirmed with the array, the largest of which was 27%TW as measured by the bobbin probe.

A total of six (6) indications of tube-to-tube wear were identified in five (5) tubes in the 3A SG. A total of twenty-six (26) indications were identified in twenty-three (23) tubes in the 3B SG. Six of the 32 array indications were newly reported, all in 3B SG. The deepest of these indications was 11%TW. In addition, there were 63 tubes with historical indications of tube-to-tube wear by bobbin in the 3A SG. There were 37 tubes with historical indications of tube-to-tube wear by bobbin in the 3B SG. These historical indications have been sized with the array probe for three outages. There was no change in the bobbin signal for this outage compared to the previous outage.

e. Number of tubes plugged during the inspection outage for each degradation mechanism

Forty-three (43) tubes were plugged in the 3A SG, forty-one (41) due to wear and two (2) due to a potential loose part (PLP) being present. Forty-three (43) tubes were plugged in the 3B SG, all were plugged due to wear. The following is a list of tubes plugged in EOC-31.

	3A SG			3B SG		
Count	Row	Tube	Reason	Row	Tube	Reason
1	56	1	TSP Wear $\geq 40\%$ TW	30	1	TSP Wear $\geq 40\%$
2	76	1	2-TSP Wear $\geq 40\%$ TW	54	1	TSP Wear $\geq 40\%$
3	112	1	PLP at 13th	77	1	TSP Wear $\geq 40\%$
4	12	3	TSP Wear $\geq 40\%$ TW	73	2	TSP Wear $\geq 40\%$

- f. **Total number and percentage of tubes plugged to date, and the effective plugging percentage in each steam generator.**

<i>Steam Generator¹</i>	<i>3A</i>	<i>3B</i>	<i>Total</i>
<i>Prior to EOC-31</i>	66	34	100
<i>EOC-31</i>	43	43	86
<i>Total</i>	109	77	186
<i>% Plugged</i>	0.70%	0.49%	0.59%

¹=There are 15631 tubes per steam generator

The effective plugging percentage is 0.70% in 3A SG and 0.49% in 3B SG.

- g. **The results of condition monitoring, including the results of tube pulls and in-situ testing.**

The cumulative SG EFPY for EOC-28 was 10.53, EOC-29 was 12.45, EOC-30 was 14.34, and EOC-31 was 16.32.

As of EOC 31, the Oconee Unit 3 steam generators had operated 15.05 EFPY since the first in-service inspection after replacement. In total, the Oconee Unit 3 steam generators had operated 16.32 EFPY since replacement.

Condition Monitoring structural and accident induced leakage integrity was demonstrated for tapered, flat, drilled support, and tube-to-tube contact wear.

A NDE maximum depth call of 60.9 %TW or less for tapered wear is sufficient to demonstrate a minimum degraded tube burst pressure of 3ΔP, 4125 psi, at 0.95 probability with 50% confidence and applying the ratio of structural to maximum depth of 0.91 and structurally effective length of 0.8 inches. The worst-case depth call for tapered wear observed during the EOC-31 inspection was a NDE depth of 50 %TW.

During the EOC-31 outage, twelve of the deeper indications in the tapered wear regions were line-by-line sized using the array inspection results and included with historical values as validation of these assumptions. All of the tapered indications profiled through the EOC-31 outage had an upper 95th ratio of structural to maximum depth of 0.90 and an upper 95th structural length of 0.36 inches.

Wear with a relatively flat profile (uniform depth) occurs in the inspection port regions of both generators. A NDE maximum depth call of 52.6 %TW or less for flat wear is sufficient to demonstrate a minimum degraded tube burst pressure of 3ΔP, 4125 psi, at 0.95 probability with 50% confidence and using a length of 1.5 inches. The maximum flat wear depth seen in either steam generator was a NDE depth of 31 %TW.

For flat wear, a length of 1.5 inches was used for a flaw with a uniform depth profile. The flat wear assumption is conservative since many of the flaws in the inspection port regions are tapered but are conservatively evaluated as flat wear scars. The conservatism in this assumption was demonstrated by reviewing historical line-by-line sizing of indications in the flat wear regions. The maximum ratio of structural to maximum depth was 0.97 and the maximum structural length was 0.72 inches.

A small population of shallow wear indications was observed during EOC-31 at drilled hole locations at the 14th support plate. The deepest of these indications was 27%TW with a circumferential extent of 67° (5.03 PDA) and an axial length of 0.71 inches. This is much less than the condition monitoring structural limit of 47.1 %TW (based on axial pull test of a 54%TW maximum depth circumferential slot with a circumferential extent of 0.98 inches (180°)). The condition monitoring limit for axial loading is a PDA of 23.6.

To address the pressure loading condition, the condition monitoring limit was calculated using the burst pressure equation for 360 degrees thinning with limited axial extent. These results show that, for a uniform thinning flaw with a bounding axial extent equal to the thickness of the TSP (1.5 inches), the condition monitoring limit is 48.7%TW. The deepest of these indications was 27%TW.

A modest population of tube-to-tube contact wear indications was detected in both steam generators. The maximum circumferential and axial extents were 82.5 degrees and 13.9", respectively. The maximum depth was 11 %TW (all measurements were made with the array probe). The Condition Monitoring limit for a tube-to-tube wear scar is 52.4 %TW assuming a circumferential extent of 135 degrees and an axial extent of 20 inches. The historical indications also met condition monitoring.

The two-tubes plugged for a PLP present were inspected with the array probe (one tube bounding) and no degradation was identified. The two PLPs were near tubes plugged during prior inspections for PLPs, one of which had caused wear therefore the two affected tubes were preventatively plugged at EOC-31.

No degradation was detected in the plug visual or bowl cladding inspections.

No in-situ tests or tube pulls were performed.

No secondary side inspections were performed.

This is the first skipped inspection since replacement for any of the Oconee units. The current EOC-31 inspection results were bounded by the previous operational assessment with margin.

List of Service Induced Indications
