701ST MEETING

ADVISORY COMMITTEE ON REACTOR SAFEGUARDS

(ACRS)

+ + + + +

OPEN SESSION

+ + + + +

WEDNESDAY

NOVEMBER 30, 2022

+ + + + +

The Advisory Committee met via Video-  
Teleconference, at 8:30 a.m. EST, Joy L. Rempe,  
Chairman, presiding.

COMMITTEE MEMBERS:

JOY L. REMPE, Chairman

WALTER L. KIRCHNER, Vice Chairman

DAVID A. PETTI, Member-at-Large

RONALD G. BALLINGER, Member

VICKI M. BIER, Member

DENNIS BLEY, Member

CHARLES H. BROWN, JR. Member

VESNA B. DIMITRIJEVIC, Member

MATTHEW W. SUNSERI, Member

DESIGNATED FEDERAL OFFICIAL:

WEIDONG WANG

ALSO PRESENT:

SAMUEL CUADRADO de JESUS, NRR

BILL JESSUP, NRR

JORDAN HAGAMAN, Kairos Power

RACHEL HAIGH, Kairos Power

BRANDON HAUGH, Kairos Power

RYAN LATTA, Kairos Power

GUS MERWIN, Kairos Power

NADER SATVAT, Kairos Power

JIM TOMPKINS, Kairos Power

CHRIS VAN WERT, NRR

Opening Remarks . . . . .	4
Kairos Fuel Qualification Methodology Topical Report	
Remarks from the Subcommittee Chairman . .	7
Presentations and discussion with representatives from the NRC Staff . . . .	35

## P R O C E E D I N G S

8:30 a.m.

CHAIR REMPE: Well, good morning. The meeting will now come to order. This is the second day of the 701st meeting of the Advisory Committee on Reactor Safeguards. I'm Joy Rempe, Chairman of the ACRS. Other members in attendance are Ron Ballinger, Vicki Bier, Charles Brown, Vesna Dimitrijevic, Walt Kirchner, Dave Petti, and Matt Sunseri.

Member March-Leuba is excused for today, and Member Halnon is not present at this time, but he may be participating intermittently during this meeting. Nevertheless, we do have a quorum. And, similar to yesterday, the Committee is meeting in-person and virtually.

A communications channel has been opened to allow members of the public to monitor the Committee discussion. Mr. Weidong Wang is the designated federal officer for today's meeting.

During today's meeting, the Committee will consider the Kairos Fuel Qualification Methodology Topical Report. And portions of this meeting may be closed as stated in the agenda. After that we'll go back to working on some of our letters that were produced in this meeting.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1           The transcript of the open portions of the  
2 meeting is being kept, and it's requested that  
3 speakers identify themselves and speak with sufficient  
4 clarity and volume so they can be readily heard.  
5 Additionally, participants should mute themselves when  
6 not speaking.

7           At this time, I'll ask other members if  
8 they have any opening remarks, and if not, I'd like to  
9 ask Dave Petti to lead us to this topic today, please.

10           MEMBER PETTI: Okay, thank you. I've not  
11 received any information, so does NRC management want  
12 to say something before we get going?

13           Go ahead, Bill.

14           MR. JESSUP: Okay, thank you, Member  
15 Petti, and thank you Chairman Rempe, for the  
16 opportunity to present to the Committee this morning.  
17 My name is Bill Jessup. I'm chief of the Advanced  
18 Reactor Licensing, Branch 1, in the NRC's Office of  
19 Nuclear Reactor Regulation.

20           This morning the staff will be providing  
21 a brief overview of our review and the safety  
22 evaluation for Kairos Topical Report, KPTR 011, Fuel  
23 Qualification Methodology for the Kairos Power  
24 fluoride salt-cooled high temperature reactor,  
25 Revision 2. This will follow a presentation from

**NEAL R. GROSS**

1 Kairos on this topical report.

2 The Kairos Report presents a series of  
3 tests, available data, and surveillance plans used to  
4 support qualification of reactor fuel pebbles  
5 utilizing TRISO fuel particles and Kairos non-power  
6 and power reactor designs.

7 The staff presented on this topic to the  
8 ACRS Kairos subcommittee on October 17th. And during  
9 that meeting, several important topics relative to the  
10 fuel qualification methodology were addressed.

11 The staff's slides today will provide an  
12 abbreviated version of the subcommittee presentation  
13 with a focus on some of the key issues raised during  
14 the subcommittee meeting, including irradiation  
15 testing and the potential impacts of salt impurities  
16 on the fuel.

17 As mentioned during the October  
18 subcommittee meeting, the HERMES test reactor  
19 construction permit review is well underway. The  
20 topical report we're discussing this morning, and two  
21 others that are going to come to the Committee early  
22 next year, are referenced in the Hermes application.  
23 And finalizing these topical reports will be necessary  
24 before the construction permit review can be  
25 completed.

[www.nealrgross.com](http://www.nealrgross.com)

1           We're looking forward to this morning's  
2           discussion, and are appreciative of the Committee's  
3           insights and comments on this very important topic.  
4           And with that, I'll turn it back over to you, Member  
5           Petti and Chairman Rempe.

6           MEMBER PETTI: Okay. With that, I think,  
7           Kairos, are you ready?

8           MR. TOMPKINS: We are ready. Can you hear  
9           me?

10          MEMBER PETTI: Not that great, actually,  
11          a little bit louder if possible.

12          MR. TOMPKINS: Okay, can you hear me?

13          CHAIR REMPE: Much better, it was a user  
14          here in the room.

15          PARTICIPANT: Thank you.

16          MEMBER PETTI: Thank you. Go ahead.

17          MR. TOMPKINS: All right, thanks, David.  
18          So my name's Jim Tompkins, Manager of Fuel Licensing  
19          at Kairos. With me here in Alameda we have Ryan  
20          Latta, who's the principal engineer for fuel  
21          qualification, Gus Merwin, who is manager of salt  
22          chemistry for Kairos, Nader Satvat, who is our manager  
23          of core design, Tim Drzewiecki who, I think, almost  
24          all of you know. He's in the room with us as well.  
25          He's in the Safety Analysis Group here at Kairos.

1           We're a little scattered today, so I'm  
2 going to kind of go through -- I think we have a  
3 number of folks calling in. So, Micah, are you on?

4           Sounds like no Micah. How about Brandon,  
5 are you on?

6           MR. HAUGH: Yes, I'm on, Jim.

7           MR. TOMPKINS: Okay. You want to just  
8 introduce yourself, and title, and everything?

9           MR. HAUGH: Sure. My name is Brandon  
10 Haugh. I'm the senior director of Modeling and  
11 Simulation at Kairos Power.

12           MR. TOMPKINS: Okay. And we also have  
13 Rachel Haigh. She's on in Charlotte. And is anyone  
14 else on from Kairos?

15           MR. HAGAMAN: Yeah, Jim, this is Jordan  
16 Hagaman, Director of Reliability Engineering and  
17 Quality Assurance at Kairos.

18           MR. TOMPKINS: Thanks, Jordan. Anyone  
19 else? All right, well, that's the group. I think we  
20 can go ahead and get started. So Rachel, you want to,  
21 can you go to the first slide?

22           So some of this material we presented.  
23 What we've put together is an abbreviated presentation  
24 that summarizes the overall methodology. And then  
25 we've got some slides discussing a couple of what we

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 thought were the key issues from the subcommittee  
2 meeting.

3 So I'm going to start with this first  
4 slide and just go over the definition that we're  
5 working to which is qualified fuel is fuel for which  
6 there's a reasonable assurance that exists that the  
7 fuel fabricated per the specification will perform  
8 consistent with the safety analysis. And so I think  
9 there's an important consideration there that it is  
10 tied to the facility you're putting it into.

11 Fuel qualification methodology is  
12 applicable to both test and power reactors. So we  
13 tried to write this generally. The qualification is  
14 subject to the conditions and limitations described in  
15 the topical report and some conditions added by the  
16 NRC in their SER. Some of the conditions apply to the  
17 power reactor only. And so I just wanted to point  
18 that out.

19 We intend to demonstrate qualification met  
20 this. The topical is the methodology for  
21 qualification. It's not the actual qualification. So  
22 we're actively initiating and starting to perform some  
23 of our lab testing. The demonstration that the fuel  
24 is officially qualified for Hermes, which will  
25 obviously come first, will be documented in safety

**NEAL R. GROSS**

1 analysis report documents as part of the licensing,  
2 which we're doing initially under Part 50.

3 So with that, I'm going to turn it over to  
4 Ryan, and he's going to walk through the -- give you  
5 a high level of the methodology and then respond to  
6 some of our questions.

7 MR. LATTA: Okay. Ryan Latta speaking for  
8 Kairos Power, Fuel Qualification Engineer. I'm first  
9 going to give a couple slides that go point by point  
10 through sections of the methodology, and then we'll  
11 follow that up with a few more slides on some specific  
12 questions that were raised in the subcommittee  
13 meeting.

14 Okay. So starting with the first section  
15 of the report, we discussed the U.S. and international  
16 experience with TRISO fuels. There's a wide range of  
17 experiences in multiple countries in the use and  
18 development of TRISO fuel and different fuel forms.  
19 And then there's subsequent use in gas reactors that  
20 were their test reactors or demonstration commercial  
21 type reactors.

22 This kind of culminates in the U.S. in the  
23 initiation of the AGR Program in the early 2000s. We  
24 ran the AGR Program to develop a particle design and  
25 perform the radiation and safety testing to qualify

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 that fuel system. The AGR 1 and AGR 2 tests were  
2 written up into a topical report written by EPRI. And  
3 that was reviewed by the NRC and issued an SER.

4 And Kairos leverages this AGR particle  
5 design and the data used in the AGR 1 and 2 in this  
6 issued SER and TR, topical report, for our application  
7 in an FHR, okay.

8 That section of the report is the Kairos  
9 Power fuel element PIRT. And so Kairos Power  
10 performed a fuel PIRT exercise with the goal of  
11 looking at the figure of merit where the figure of  
12 merit was fission product transport and release from  
13 the fuel under different conditions of normal  
14 operation and accidents in our application to an  
15 AP-FHR.

16 In doing this, we identified over 200  
17 phenomena related to fuel performance and then  
18 identified the high importance phenomenon for further  
19 investigation. These were high importance levels and  
20 low -- medium to low mileage levels. And that kind of  
21 forms a lot of the basis of the qualification  
22 methodology, and specifically the pebble laboratory  
23 test section that I'll talk about later.

24 Okay. Next section is on the fuel  
25 specification, manufacturing, and quality control

1 through inspection. So as I previously said, Kairos  
2 leverages the AGR particle design. We have a fuel  
3 specification that's equivalent to what was used in  
4 the AGR Program.

5 Currently we're developing TRISO  
6 manufacturing and annular fuel pebble development in  
7 an in-house program to produce a quality commercial  
8 product. Product that is produced goes through a  
9 quality control process where inspection is used to  
10 ensure that the fuel specification is met. The fuel  
11 indeed does meet the product specification equivalent  
12 to the AGR Program. And in forming that  
13 characterization, we demonstrate that quality is  
14 maintained.

15 Okay, next section is the fuel  
16 qualification envelope. So as I previously said we're  
17 leveraging the AGR Program, and this defines our fuel  
18 qualification envelope. Specifically in this case,  
19 we're leveraging AGR 2 that was documented in the EPRI  
20 TRISO topical report. And so the fuel qualification  
21 envelope considers irradiation test conditions and  
22 transient conditions.

23 There are four key parameters for normal  
24 operation. These are power, temperature, burn-up, and  
25 fluence. And the initial reactor has to operate

1 within this envelope for steady state conditions and  
2 without needing additional irradiation test data  
3 outside of that -- if you're going to operate outside  
4 of that test data within the commercial reactor, then  
5 you need additional irradiation testing to meet the  
6 new envelope.

7 Additionally, there are temperature limits  
8 for transient conditions, and also noting that there  
9 are significant margins in the temperature regime  
10 which AGR was tested. Tests were conducted versus the  
11 KB-FHR designs for both the test and power reactor.

12 Next slide, please. Okay, the next  
13 section of the report is on pebble laboratory testing.  
14 And so this test program came out of the findings of  
15 the PIRT. The high priority items identified were to  
16 be investigated in this test program with the goal of  
17 demonstrating that the pebbles and particles meet  
18 function requirements, that there's no physical damage  
19 or interaction of particles with FLiBe.

20 And so there are two categories of testing  
21 that are being worked on. The first category is  
22 mechanical test of the pebble. The second category is  
23 material compatibility testing of the pebble.

24 The prescribed mechanical tests are pebble  
25 compression, pebble impact, tribology, which is wear

1 behavior, and then molten salt infiltration behavior.  
2 The material compatibility tests are interactions of  
3 the pebble with FLiBe or with air. And then for each  
4 of these specific tests, acceptance criterias were  
5 defined within the topical report.

6 The next section, fuel irradiation  
7 qualification testing, so if you, as I previously  
8 described, if you are outside of the fuel  
9 qualification envelope, it requires a fuel irradiation  
10 test. The test that's proposed is very similar to the  
11 AGR type of irradiation tests that were performed in  
12 the AGR.

13 We would use our TRISO fuel particles, a  
14 statistically significant number of them in our  
15 annular fuel pebble design. And then we would perform  
16 an irradiation test at the bounds of the commercial  
17 reactor to extend the bounds of the qualification  
18 envelope.

19 Fission product gas monitoring would be  
20 performed during the test to understand the failure  
21 fraction of fuel in the test. And then after the  
22 test, there would be PIE performed to confirm the  
23 failure fraction and the behavior of the fuel.

24 MEMBER KIRCHNER: This is Walt Kirchner,  
25 just a clarification. So you're just talking about

1 fuel particles, not fuel particles in a pebble?

2 MR. LATTA: No, these would be fuel  
3 particles in our annular fuel pebble design, so it  
4 would be in our annular pebble, the Kairos pebble. So  
5 they would be inside the pebble.

6 MEMBER KIRCHNER: Okay, thank you.

7 MEMBER PETTI: And, Walt, because this is  
8 for the bigger reactor.

9 MEMBER KIRCHNER: Yeah.

10 (Simultaneous speaking.)

11 MEMBER PETTI: Not for Hermes, right?

12 MR. LATTA: Yes, that's correct. Okay,  
13 that section is on fuel performance modeling. This  
14 section, for information, right, the description of  
15 models related to fuel that Kairos is using, the main  
16 focus is on KP-BISON which is the subject of a  
17 previous topical report where an SER was -- where the  
18 topical report is reviewed and an SER issued.

19 The KP-BISON would be validated to IAEA,  
20 and AGR data, and eventually to Kairos-produced  
21 irradiation test data. And this tool has been used  
22 for core design and source term analysis.

23 There's additional description of DEM and  
24 FEM models that are used to understand the flow  
25 behavior of pebbles to the core, wear, behavior, and

1 loads in the core, and along with mechanical behavior  
2 of the pebble.

3 Next section of the report is the  
4 in-service surveillance program --

5 MEMBER PETTI: Just to go back a question  
6 on the performance model.

7 MR. LATTA: Yes.

8 MEMBER PETTI: You plan on running the  
9 test predictions of this irradiation that's in the  
10 second bullet and then also sort of a post-test --

11 MR. LATTA: Yeah, yeah.

12 MEMBER PETTI: -- sort of thing?

13 MR. LATTA: Yeah, you know, for designing  
14 an irradiation test, we'll certainly be modeling it  
15 before we conduct the test. Yeah.

16 MEMBER PETTI: Thank you.

17 MR. LATTA: Okay. Speaking to Field  
18 Surveillance program, so once there's a test reactor,  
19 a commercial reactor, in those reactors there would be  
20 a surveillance program for the fuel to confirm fuel  
21 performance in the operating environment.

22 In this case, the surveillance program has  
23 three parts. The first part is fission product  
24 monitoring in the cover gas and FLiBe coolant for  
25 radioactivity. There's a circulating limit that's

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 allowable for the reactors.

2 Next part is the pebble inspection. So  
3 pebbles traverse the core and are reinserted into the  
4 core. As you saw, the pebbles exit the core, they are  
5 inspected for physical damage along with the burn-up  
6 being measured over their lifetime.

7 The third part of fuel surveillance is  
8 destructive PIE. And so pebbles that have reached  
9 their equilibrium would be extracted from the core  
10 through the pebble handling system. And they'd be  
11 sent to hot cells where PIE would be performed on test  
12 reactor pebbles and pebbles from the initial power  
13 reactor. And the objective there is to confirm fuel  
14 performance of the fuel in its application.

15 MEMBER PETTI: Just a question for  
16 clarification. I didn't think, based on previous  
17 discussions that we've had, that you'd actually ever  
18 get to equilibrium in Hermes in a pebble. So, that  
19 would only be pebbles in the power KB-FHR?

20 MR. LATTA: The maximum burnup would be  
21 much slower in the Hermes.

22 MEMBER PETTI: Right. So you can't  
23 monitor your PIE on a pebble that had reached  
24 equilibrium burn-up until you're downstream in with  
25 the --

1 MR. LATTA: It would be the --

2 MR. SATVAT: Yeah, this is Nader for core  
3 design. Basically, the maximum burn-up that is  
4 achievable in Hermes, based on the full lifetime of  
5 Hermes, there is a possibility of achieving  
6 equilibrium. But because of capacity factors, it  
7 might not happen.

8 MR. LATTA: So it would be the maximum  
9 burn-up in Hermes which may or may not be the  
10 equilibrium for Hermes.

11 MEMBER PETTI: Right, okay. Thanks, that  
12 helps.

13 MR. LATTA: Yes, thank you.

14 Okay, next slide, please. So that was a  
15 summary of the fuel qualification methodology. The  
16 next few slides go in to address a few questions,  
17 specific questions from the previous subcommittee  
18 meeting.

19 These two questions, the first was related  
20 to the presence of transition metals in FLiBe and  
21 their effect on the sodium carbide layer. Second  
22 question was related to pebble irradiation program and  
23 irradiation testing for the Hermes test reactor. So  
24 in the next couple of slides, I'll go through those,  
25 address these questions in some more detail.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1           Okay, first slide here says relates to the  
2           presence of transition metals in FLiBe. So we're  
3           conducting laboratory testing of the pebbles in FLiBe  
4           at temperature and pressure, and looking at pressure  
5           thresholds for infiltration of FLiBe, and we're  
6           precluding infiltration by design in the fuel so that  
7           FLiBe will not reach the fuel region of the pebble.

8           For any kind of mechanism to occur here,  
9           the FLiBe would have to infiltrate into the fuel  
10          region, and this would have to bring the transition  
11          metal fluorides in contact with the TRISO particle.

12          Additionally, the OPIC layer separates the  
13          SiC layer from the free surface of the OPIC. So you  
14          have to go through the OPIC, the metal fluorides would  
15          have to transmit through the OPIC. So you would have  
16          to have a failed OPIC contact between the salt and the  
17          sodium carbide.

18          The previous meeting, I brought up about  
19          AGR-567 where Capsule 1 had a significant amount of  
20          failures due to nickel ingressing into the fuel and  
21          damaging the particles. That's performed at a  
22          significantly higher temperature than KB-FHR fuel  
23          operates at. It's at least 500 degrees temperature  
24          difference or more higher in the AGR test.

25          Additionally, there was an overwhelming

1 amount of nickel in the AGR irradiation. There was an  
2 Inconel nickel-based alloy sheath covered a niobium  
3 sleeve where it is believed that the two components,  
4 nickel and niobium, formed a low melting point  
5 eutectic. And this helped to transport nickel through  
6 the system resulting in failures. Whereas in our case  
7 we have transition metal fluorides in salt.

8 So because of these low temperatures and  
9 difference in the system, due to these detrimental  
10 effects were active, we expect them to progress very  
11 slowly. And in the instance of TRISO failures, we are  
12 monitoring fission gas products in the gas space and  
13 the coolant spaces of the reactor. And there's a  
14 circulating activity limit that's a technical  
15 specification for the reactor. And this really  
16 ensures the safety of the system.

17 MEMBER PETTI: So let me -- there's a lot  
18 on the exhibit I don't understand. We have a  
19 different understanding of the system. I'm not  
20 worried about transition metal fluorides. If you're  
21 doing redox control you will have elemental transition  
22 metal because of the redox state. Those metals, even  
23 though it doesn't fully wet a pebble, they will be in  
24 contact and can get into the pebble.

25 It doesn't have to get into the TRISO

1 particle, it just has to get into the matrix. There's  
2 old data from General Atomics where they introduced  
3 iron from their furnace that fell into their  
4 compacting equipment. And a little bit of iron got in  
5 and attacked.

6 Second, you've seen the letter, the draft  
7 letter. There are references to show that transition  
8 metals will react with silicon carbide much more  
9 quickly. There's 500 degrees C lower. That's  
10 irrelevant. There's data out there from diffusion  
11 experiments to show that if you can get the material  
12 to the silicon carbide layer, even at lower  
13 temperatures, that you will start to get the corrosion  
14 to occur.

15 Now, so the question is, can you get it  
16 there? That's the big issue.

17 MR. LATTA: Right.

18 MEMBER PETTI: And I would argue that  
19 there's so little experience in this new first of a  
20 kind system that that's an issue that should be  
21 thought about.

22 MR. TOMPKINS: Let me just respond, first  
23 by saying that, yeah, we agree that the, you know,  
24 even at lower temperatures it's still going to be a  
25 problem. But our understanding is that it would be

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 slower. But the real protection is making sure the  
2 salt doesn't get there in the first place. That's  
3 really what we're trying to design out of the system.  
4 And I don't know --

5 MEMBER PETTI: So again, I have this  
6 mental problem, because I read a topical report that  
7 said that the tritium is going to get all into the  
8 graphite. We're going to mass transport all the  
9 tritium that's produced in the FLiBe and get into the  
10 graphite. But we're not going to get any of these  
11 metallic elements that are in the salt to the surface  
12 of the graphite.

13 They're going to pretty much get there by  
14 the same mechanism which is mass transport in the  
15 liquid. So again, I'm having trouble with the physics  
16 in trying to put the whole picture together.

17 MR. MERWIN: This is Gus Merwin from salt  
18 chemistry. I'll take maybe two small points. If  
19 redox control is implemented, it'll be implemented in  
20 the chemistry control system which is separate from  
21 the reactor core as well as the primary heat transport  
22 system. And so the making of metallic particles would  
23 be physically separated from the fuel region of the  
24 core. And then that --

25 MEMBER PETTI: What does that mean? I

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 don't understand what you're talking about. If you  
2 set the redox, you set the equilibrium condition in  
3 the entire coolant system. You agreed to do it,  
4 that's fine that you're doing it outside the core,  
5 that's an easy place to do it. It makes sense. But  
6 whatever you do, you set that chemical equilibrium  
7 across the entire system. Otherwise, it wouldn't  
8 work.

9 MR. MERWIN: I agree. The goal of redox's  
10 potential is it's going to keep those transition  
11 metals in a metallic form which would not bring them  
12 into the reactor coolant. They would stay in the  
13 element.

14 MEMBER PETTI: But they're coming in off  
15 the walls, all the surfaces.

16 MR. MERWIN: Which would make them  
17 fluorides. They'd be in an oxidation process.

18 MEMBER PETTI: And then they would be  
19 reduced to elemental because of the redox condition.

20 MR. MERWIN: I don't believe that they  
21 would first oxidize and then reduce in the salt. If  
22 the system's at equilibrium, there would be either a  
23 driving force to oxidize them or a driving force to  
24 reduce them. Having both of them in parallel doesn't  
25 make sense to me.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1 MEMBER BALLINGER: Have you folks produced  
2 what amounts to a PORV diagram for this system.

3 MR. MERWIN: Yes, but we are not crediting  
4 that in this fuel performance topical.

5 MEMBER BALLINGER: That's where they would  
6 find a few and be able to define the conditions, the  
7 electrochemical conditions, so potentially the system.  
8 And you could -- that's where they map the various  
9 species.

10 MEMBER BALLINGER: Correct --

11 MEMBER PETTI: There will always be an  
12 equilibrium between the oxide and the metal. And if  
13 you're doing redox control, the oxide should be very  
14 low, right?

15 MEMBER BALLINGER: And you have to know  
16 where the potential actually is with respect to --

17 MEMBER PETTI: And if they do what they're  
18 going to do, which again, I don't want to get into  
19 details, the way they're going to control the redox,  
20 you keep it fairly low. So they should be elemental.

21 But those elements, it's coming off all  
22 the metal. That's why there's a lifetime on the  
23 vessel. Go ahead, keep going.

24 MR. LATTA: Okay. We can move to the next  
25 slide if there's no more comment.

1                   Okay? The next two slides talk to these  
2                   --

3                   COURT REPORTER: Just a friendly reminder  
4                   from the court reporter to identify yourself as you  
5                   speak.

6                   MR. LATTA: Okay. This is Ryan Latta  
7                   speaking. The next couple of slides talk to the issue  
8                   you brought up about elutriation testing for the test  
9                   reactor, some technical discussion and discussion of  
10                  the licensing of a test reactor.

11                  So this first slide, fuel causation  
12                  methodology ensures the reasonable assurance and  
13                  demonstrates that through the test program that's  
14                  proposed. Additionally, in this reactor, there's the  
15                  additional barrier in the core of having FLiBe present  
16                  as an additional and separate barrier for the release  
17                  of fission products.

18                  And that mitigates safety concerns within  
19                  the reactor itself. The AGR Program extensively tests  
20                  radiation tested TRISO particles, and that defines our  
21                  qualification envelope.

22                  Kairos, as I've discussed, leverages the  
23                  TRISO particle design and ensures, through  
24                  manufacturing and inspection, that a high quality fuel  
25                  form is produced. And that is in compliance with the

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 fuel specification for this particle type.

2 Speaking to the test reactor itself,  
3 there's a defense-in-depth philosophy here within the  
4 core, use of TRISO particles plus five coolants,  
5 previous discussion of different gas reactors operated  
6 at higher normal operating and accident temperatures,  
7 whereas these FHR temperatures and accidents in normal  
8 operations are on the lower end. The combination of  
9 these diverse and defense-in-depth approaches ensure  
10 the safety of the reactor.

11 Additionally, in the case of fuel failure,  
12 surveillance is being performed, activity is monitored  
13 in the cover gas space and in the coolant spaces on  
14 the reactor. And there's a circulating limit on  
15 maximum allowable activity that will affect operations  
16 as it's approached. Because of this, it represents no  
17 challenge to the public health and safety.

18 Next slide, please.

19 MEMBER KIRCHNER: Excuse me.

20 (Simultaneous speaking.)

21 MEMBER KIRCHNER: This is Walt Kirchner.

22 Oh, sorry, Dennis, go ahead.

23 MEMBER BLEY: Okay, thanks. I've been  
24 stewing over that last discussion, Dave, and Ron, and  
25 you folks from Kairos' discussion. The PORV diagram,

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 and showing where you live on that, and the different  
2 processes ought to be helpful. You said -- Kairos  
3 says they have one. But they don't think they need it  
4 here. We seem to have a difference of opinion which  
5 perhaps that would help.

6 Is that something you could share in a  
7 closed session? And, Dave, I wonder if that would  
8 help from your point of view?

9 MEMBER PETTI: I think I know what Ron was  
10 asking for. I mean, have it in my head.

11 MEMBER BLEY: I mean, you've got the PORV  
12 diagram in your head is what it sounds like.

13 MEMBER PETTI: Yes.

14 (Laughter.)

15 MR. MERWIN: This is Gus Merwin, manager  
16 of salt chemistry. We can talk in more detail in the  
17 closed session. There is boundary limits for redox  
18 control that are stated as part of source term topical  
19 that limit the, at least on the fluoride scale, the  
20 redox potential of the salt.

21 But we are intentionally not crediting it  
22 for fuel performance strictly because we do not  
23 believe that salt chemistry is related to fuel  
24 performance, because interaction of the salt liquid  
25 with the TRISO is precluded by design.

1           So the chemistry control system and how  
2           we operate the salt chemistry, in our opinion, I don't  
3           want to be too bold here, but it's not related to TRISO  
4           performance. That's in the boundary of the statements  
5           in the topical.

6           MEMBER BLEY: Well, I kind of got that was  
7           your position, but it might help.

8           PARTICIPANT:       Certainly    an    added  
9           supporting thing though.

10          MR. MERWIN:   Certainly.

11          MR. TOMPKINS: Well, could we provide more  
12          discussion in a closed session, Gus? Do you have --

13          MR. MERWIN:   Certainly.

14          MR. TOMPKINS:   Okay, all right.   Maybe  
15          that's something we do in the closed session.

16          MR. LATTA:    Okay.   Ryan Latta speaking  
17          again.   So this is our final slide.   So the Hermes  
18          test reactor provides important confirmation of the  
19          FHR technology and supported deploying our commercial  
20          reactor.   The Hermes reactor is a full integral test  
21          of Kairos fuel for the application in the power  
22          reactor.

23                 And in looking at the Atomic Energy Act,  
24          licensing of test reactors, there is significant  
25          latitude related to the licensing of test reactors.

1 I'll just read the first quote here, but it says in  
2 issuing licenses under the subsection of the AEA, the  
3 Commission shall impose the minimum amount of such  
4 regulations to fulfill its obligations under the act.

5 And so in conclusion, there's been  
6 extensive testing of TRISO fuel under the DOE AGR  
7 Program along with Kairos Power's laboratory test  
8 program of the fuel pebble form and its manufacturing  
9 programs.

10 And this also, in addition to the defense-  
11 in-depth and diverse safety of the FHRs and retention  
12 of radionuclides, cites the TRISO fuel, combination of  
13 the TRISO fuel with the five coolants and the  
14 monitoring of fuel, provides the reasonable assurance  
15 of the protection of public health and safety which is  
16 consistent with the AEA.

17 When considering this project as a whole  
18 and its application to the FHR, we're able to  
19 demonstrate that we meet the public health and safety  
20 consistent with the Atomic Energy Act.

21 MEMBER KIRCHNER: This is Walt Kirchner.  
22 Let me just understand what you're saying here. So  
23 Hermes is part of your fuel qualification methodology  
24 AGR then? And the testing in Hermes will be the  
25 qualification of your fuel --

1 MR. TOMPKINS: No.

2 MEMBER KIRCHNER: -- for reactor  
3 application.

4 MR. TOMPKINS: No, actually not. The  
5 testing for the power reactor will probably be done in  
6 an oxide test facility like a patent or something like  
7 that. Because we're trying to expand the  
8 qualification envelope. We need it to expand the  
9 qualification envelope for the power reactor.

10 But, you know, I -- this is James  
11 Tompkins, sorry about that. But clearly, we're going  
12 to, you know, we're going to look at what happened in  
13 Hermes, and we're going to factor that. That'll be  
14 part of the qualification, in a sense.

15 But it's not directly tied to it. I mean,  
16 and part of the reason for that is that we might  
17 decide at some point we're not going to it in Hermes.  
18 I mean, I can't guarantee that we're going to go over.  
19 I mean, we plan to. So we need a way to expand that  
20 envelope so we would do that testing, most likely in  
21 an outside facility. That answer your question, Walt?

22 MEMBER KIRCHNER: Yes, part way. Can you  
23 go back to the previous slide?

24 MR. TOMPKINS: Okay.

25 MEMBER KIRCHNER: Well, the reason

1 irradiation testing was done for all HTGRs wasn't the  
2 temperature. It was to qualify the fuel, because the  
3 whole argument is that this is functional containment.  
4 And you had to take production scale fuel and test it,  
5 and irradiate it to demonstrate that the finished  
6 product didn't have defects from the manufacturing  
7 process.

8 Let me ask a few other questions. Who's  
9 going to make your fuel?

10 MR. TOMPKINS: I think, ha, ha, I don't  
11 want to --

12 MEMBER KIRCHNER: And a manufacturing spec  
13 process is, this is, you know, operating these coating  
14 machines at scale is something of a black art.

15 MR. TOMPKINS: Yeah.

16 MEMBER KIRCHNER: And one needs to have a  
17 lot of trial and error before you get to the quality  
18 that's required from the EPRI spec.

19 MR. TOMPKINS: I don't think we can  
20 announce who's making our fuel yet. But I will say  
21 that we've expended significant resources in the last  
22 year or so making pebbles, and also testing how to  
23 make particles. And so that's underway.

24 MR. LATTA: And also through the ARDP we  
25 worked with the National Laboratories through CRADAs

1 with Oak Ridge and INL.

2 MEMBER KIRCHNER: Well, my point's a  
3 subtle one. It's not until you actually, whether you  
4 make it or you contract for someone to make the fuel,  
5 you've got to stand up that production line and make  
6 significant quantities of fuel and test it before you  
7 have confidence that you've got a product that you can  
8 actually put in the reactor. And I'm assuming that's  
9 part of the Hermes demonstration.

10 MR. MERWIN: Yeah, and that's part of what  
11 Ryan talked about, the pebble development process that  
12 we're doing where, as we make pebbles, and we make  
13 particles, we learn from that. And we've already made  
14 some adjustments that were discussed at the last  
15 meeting.

16 For example, we found in making pebbles  
17 that the pressures were too high. And we were  
18 breaking, you know, we were causing breakage. And so  
19 we revised the process to reduce the pebbles, or to  
20 reduce the suppressing pressure.

21 MR. LATTA: Yeah, so this is Ryan Latta  
22 speaking. So in the development program there's, you  
23 know, there's extensive characterization of the fuel  
24 post fabrication, you know, use of the big  
25 consolidated leach-burn-leach process, use of other

1        characterization techniques to inspect the TRISO  
2        particles after they've been incorporated into a fuel  
3        form.

4                Additionally, in talking to defense in  
5        depth here and the difference between -- with gas  
6        reactors, you know, in this core we also have FLiBe as  
7        a containment. And it was just pointing out that  
8        temperatures are low in an FHR which, you know, reduce  
9        the transport of fission products. And these are  
10       additional barriers of safety that are not present in  
11       other reactors that have been licensed with TRISO  
12       fuel.

13               MR. TOMPKINS: And by the way, we know  
14       who's going to make our fuel. I don't think we've,  
15       you know, officially announced it yet. So that's why  
16       I'm hesitant to say.

17               MEMBER KIRCHNER: Thank you.

18               MR. LATTA: Are there questions?

19               MEMBER PETTI: Yeah. So what I'm  
20       struggling with, and members, I need help here, is  
21       that this is new information that's not in any of the  
22       written documentation. And I was told once by senior  
23       ACRS members that this is nice. But we have to go by  
24       the written record.

25               This is very helpful. I mean, I expected

1 the last slide that did say, because of the test  
2 reactor, they got a light touch. That's not written  
3 down anywhere. But that, they're saying that. It's  
4 not in the SE. It's not in the topical report. And  
5 so it is this missing context in my opinion.

6 And just read the topical report because,  
7 A, because it's time to do both, it's time to do it  
8 for the power reactor and for Hermes. But some of  
9 this would be, if it was in the written documentation,  
10 would help put more context around this.

11 CHAIR REMPE: And, again, the latest  
12 version of a draft letter that I've seen basically  
13 points out that the draft SE needs some enhancement  
14 before it should be issued. And we may want to change  
15 some of this. But again, I mean, that's where we're  
16 at on what should be said. Because, again, if there's  
17 also discussion about the chemistry and to go like  
18 that, that needs to be documented.

19 MEMBER PETTI: Okay. Any other comments,  
20 members?

21 MEMBER KIRCHNER: Can we see the last  
22 slide again? I'm just saying, so the intention is,  
23 going forward, Kairos will do pebble testing in  
24 another reactor to get up to the temperatures and  
25 exposure that you would see for an actual power

1 reactors.

2 MEMBER PETTI: Right.

3 (Simultaneous speaking.)

4 MEMBER PETTI: Yes.

5 MEMBER KIRCHNER: Yeah, okay.

6 MEMBER PETTI: You know, historically, in  
7 TRISO irradiation, your radiation comes as two  
8 functions. One is performance. The other is  
9 confirmation of manufacture. Because the spec  
10 historically has been viewed as never being  
11 absolutely, 100 percent, you know, perfect, just  
12 because of the history of TRISO fuel. So they're  
13 separate here. And that's the subtlety.

14 Any other questions, members? If not, I  
15 guess we can turn to staff.

16 MR. CUADRADO: Yeah, this is Samuel  
17 Cuadrado from the staff. I'll be running the slides  
18 for the staff.

19 MEMBER PETTI: Okay. Give us a minute.

20 MR. CUADRADO: Okay.

21 MEMBER PETTI: They're getting up to the  
22 front table here.

23 MR. CUADRADO: All right.

24 MR. VAN WERT: Good morning, my name is  
25 Chris Van Wert. I'm staff, and I will be presenting

1 our review on the Kairos Power Topical Report,  
2 KP-TR-011, field qualification methodology for the  
3 Kairos Power fluoride salt-cooled, high temperature  
4 reactor.

5 Next slide please. So Kairos requested  
6 staff review approval of the topical report. And as  
7 mentioned this morning, it covers both the power and  
8 the non-power versions of the KP-FHR. The staff's  
9 review focused on the overall fuel qualification  
10 framework, which includes but is not limited to the  
11 use of existing data, surveillance, unirradiated  
12 testing, and irradiation testing.

13 All right. And next slide, please. I  
14 keep trying to advance the slides myself. I  
15 apologize. So just quickly, the regulatory basis here  
16 is the same slide as from the subcommittee meeting.  
17 We cover 50.34(a) and (b), 50.43(e), as well as 10 CFR  
18 111, additionally, PDCs 10 and 16 which were  
19 previously approved in a PDC topical report for the  
20 basis as well.

21 Next slide, please. The Kairos fuel  
22 qualification topical report builds heavily upon  
23 existing data, namely the EPRI topical report which  
24 provided fuel qualification for the particle level for  
25 TRISO particles from the AGR-1 and 2 program. In

1 addition to that, existing data regarding carbon  
2 matrix property data is used to inform their testing  
3 matrix. The staff reviewed the data that they were  
4 using and confirmed that it was applicable to given  
5 the operating conditions for the Kairos reactor  
6 design.

7 As in Section 39 of the topical report,  
8 they present the fuel surveillance plans for the fuel  
9 qualification. This includes cover gas monitoring,  
10 un-destructive examinations, and planned destructive  
11 examinations. And the staff found that these were  
12 acceptable for monitoring fuel performance and  
13 detecting particle failure.

14 Next slide, please. Section 3.6 of the  
15 topical report covered planned fuel pebble laboratory  
16 tests. And these included mechanical, tribology,  
17 buoyancy, salt infiltration, and material  
18 compatibility testing.

19 The staff reviewed the test plans and  
20 confirmed or determined that they were acceptable for  
21 use for determining the pebble conditions. And this  
22 is based on the sort of test conditions that were  
23 going to be used of un-radiated tests in consideration  
24 with the planned operating conditions.

25 And as far as the radiation testing, if I

1 talk a little bit more on this, this follows from  
2 this morning, but the Kairos plan is to include  
3 radiation in a gas environment, purge gas monitoring  
4 for fission gas, and also post-irradiation  
5 examinations. This was presented in 3.7 of the  
6 topical report.

7 And the testing methods that were used  
8 were similar to the ones used for the EPRI TRISO  
9 particle topical report and the non-destructive PIEs  
10 which include looking for damage to the fuel pebbles,  
11 as they go through the EHSS. That would help  
12 determine if there was a manufacturing flaw which  
13 would lead to damage to the pebbles as it circulated  
14 around.

15 And then the post-radiation examination  
16 includes the consolidated leach-burn-leach  
17 investigations to determine, or to confirm the  
18 particle fraction, failure fraction.

19 The staff reviewed the irradiation testing  
20 plans as presented in Section 3.7 of the topical  
21 report, and noticed again that it closely follows  
22 previously accepted testing conditions and methods and  
23 that it's acceptable for the purposes that Kairos laid  
24 out.

25 Next slide, please.

1 MEMBER KIRCHNER: Just a minor --

2 MR. VAN WERT: Yes.

3 MEMBER KIRCHNER: -- Chris. Looking ahead  
4 to the power reactors, and you would either use the  
5 results from Hermes to demonstrate the compatibility  
6 with FLiBe under the irradiation environment. I mean,  
7 irradiation and gas for a gas cooled reactor which is  
8 going to be cooled with helium --

9 MR. VAN WERT: Right.

10 MEMBER KIRCHNER: That's, you know, it's  
11 an inert gas. So that's a lot different than being in  
12 a FLiBe environment.

13 MR. VAN WERT: So I think we heard this  
14 morning from, I believe, from Jim Tompkins who was  
15 answering a related question. If they have results  
16 from Hermes, they'll obviously use that for informing  
17 their process and informing their decisions on the  
18 power reactor.

19 However, they are running pebble tests in  
20 the patent type of reactor. I don't think they've  
21 decided on where, but that will support their power  
22 reactor. So they will have that data too. So it's  
23 not completely necessary, but obviously they will be  
24 using it, and they will have that at their hand as  
25 long as Hermes is built and operated.

WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1                   Next slide, please. Oh, yeah. All right,  
2                   so based on conversations that we had at the  
3                   subcommittee meeting and in further conversations with  
4                   Kairos, of course, we went wanted to add this  
5                   discussion as well.

6                   You heard the physical description this  
7                   morning in the Kairos presentation that the staff was  
8                   looking at the possible sources of impurities, you  
9                   know, corrosion products or LNL, iron, chromium,  
10                  nickel, that can be present.

11                  You know, the staff's review, of course,  
12                  is focused on not only the transport mechanism that  
13                  would potentially lead to these TRISO particles being  
14                  attacked by these products, but also how would this  
15                  work overall from a, or how would it be viewed from a  
16                  safety standpoint?

17                  Are we reaching that reasonable assurance  
18                  of safety for the public and the environment? And so  
19                  we're looking at the transport mechanism, but we're  
20                  also looking at how this would play out with the  
21                  reactor.

22                  And so, you know, as you heard this  
23                  morning they have the chemistry control system which  
24                  will help minimize the amount of the corrosion  
25                  products or elemental articles in the molten salt. If

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 it were to be transported, you know, they have their  
2 testing to show that the salt is not going to be  
3 infiltrating down to the fuel layer.

4 They also have, you know, the level of  
5 assurance when they're investigating the pebbles as  
6 they go around to ensure that there's no damaged fuel  
7 beyond the specifications that they include, their  
8 criteria for damaged pebbles.

9 So with this in mind, the salt should not  
10 be reaching the fuel layer. The overall system would  
11 also detect any particles that did become compromised  
12 through the cover gas monitoring system as well.

13 So with the entirety of that combined, so  
14 the difficulty in the transport mechanism along with  
15 the ability to detect damaged particles, sorry,  
16 damaged pebbles, as well as, you know, any early  
17 failures that were to occur, the staff found that  
18 reasonable assurance was reached in terms of public  
19 health and safety. Any questions?

20 MEMBER PETTI: If they could have an  
21 indication from the gas monitoring that a pebble  
22 somewhere is involved, but you don't know which one it  
23 is --

24 MR. VAN WERT: Right.

25 MEMBER PETTI: -- and you will not know

1       which one it is even when you to run it through the  
2       pebble monitoring system, right, you'll not do that.

3               It's not an issue, in my opinion, on  
4       solubility limits.       They're not going to be  
5       precipitating metals stock.       But, you know, real  
6       engineered system, not a perfect laboratory, 100 ppm  
7       of some of these materials could be quite reasonable.

8               And my mental picture, and again, I could  
9       be wrong, is anything being done outside the core is  
10      a little too late in terms of filtering.       Because that  
11      graphite is huge filter.       I mean, you know, graphite  
12      combination materials are used all over the place as  
13      filters, right.

14              And I'm pushing all this salt through.  
15      And again, it doesn't have to get into the fuel layer.  
16      That pebble is a very porous layer.       It just has to  
17      get to the surface, and it'll start migrating down the  
18      surface.

19              You know, that's the concern.       And again,  
20      I said this in the subcommittee, if you take two  
21      technologies, and you bring them together, you don't  
22      bring just the good.       You also potentially bring some  
23      negatives.       And you've got to think in the negative  
24      space.       And that's what struck me, was that I didn't  
25      even see it.

1           Talk about acknowledge, there's references  
2     in the draft letter, this has been studied for  
3     electronics, actually. And it's more simple. They  
4     put iron, chromium, and nickel up against silicon  
5     carbide. And even at 600 degrees, it moves really  
6     quickly to calculate through 35 methods. So, you  
7     know, it's not purely a high temperature, you know. It  
8     can happen at low temperature.

9           CHAIR REMPE: Once you go on, I mean,  
10    listening to this, the subcommittee meeting and today,  
11    and I'm looking through the 11-page draft SE, do you  
12    think maybe it needs to be beefed up a bit in some of  
13    the discussion based upon, I mean, I'm seeing some  
14    more discussion in your slides than what we saw in the  
15    subcommittee. Are you guys in agreement, yeah, we  
16    probably need to revise the SE and add a bit more  
17    detail?

18          MR. VAN WERT: I mean, that's something  
19    that we can definitely investigate. And if you're  
20    talking about the SE, I think that's easier for the  
21    staff to do. I don't know if -- and I'm looking over  
22    at Billy a little bit here, but the current state on  
23    that, we can open up the SE, correct, and make  
24    adjustments if necessary here.

25          PARTICIPANT: I tend to agree with that.

1 CHAIR REMPE: Thank you.

2 MEMBER PETTI: My concern, I mean, look at  
3 this at 100,000 feet. Take Kairos out of it. You've  
4 got a new fuel flow. I'm sorry, go read the EPRI  
5 topical report. All it says is the particles are  
6 good. It doesn't say anything about the fuel element.  
7 And it says you have to qualify that yourself, each  
8 vendor, right.

9 At 100,00 feet, I've got a reactor, I'm  
10 going to put this fuel in with a novel coolant, and  
11 we're not actually ever going to see neutrons before  
12 the thing is actually operated. That precedent is  
13 what bothers me, because there's others out there  
14 whose fuels are nowhere near as mature this,  
15 potentially.

16 That's the other concern I have in the  
17 back of my mind, is that there's not enough guardrails  
18 in the SE to kind of say why you went down this road.  
19 So it doesn't look like it's a precedent for  
20 everybody, because of the importance in fuel.

21 MR. VAN WERT: And I definitely understand  
22 that, and I think maybe it's something you touched on  
23 earlier, I think. Also it's something maybe I should  
24 have been more clear in the SE. It was the separation  
25 between Hermes and full power.

1           So yeah, if another full power came in  
2           and wanted to jump straight to this, that would be  
3           different. And we are talking about Hermes here. So  
4           the purpose of the Hermes reactor is, to some extent,  
5           proved a concept. It's also to provide data, you  
6           know, for Kairos to use.

7           And so our approval is specific to this.  
8           They will be running their separate tests for the  
9           power reactor as well. So I do think we have to kind  
10          of keep that in our mind. They're running the best  
11          integral testing you could ever do. You know, they're  
12          building a one-third scale reactor. They will be  
13          getting the data.

14          I understand that it would be great to  
15          know everything before we build it, but I think we  
16          have to consider the safety impacts. So we have a  
17          good feeling that the fuel, a very good feeling that  
18          the fuel will not have these failures to begin with.

19          And then if you look at the rest of the,  
20          you know, the Hermes design, I think that that's the  
21          purpose of the test reactor, is to get this  
22          information.

23          MEMBER KIRCHNER: That was the problem I'm  
24          having is like Dave. Conceptually, I mean, Kairos  
25          should be lauded for what they're doing. And one

1 would hope that other advanced reactor concepts would  
2 also build what I'll call a prototype.

3 And I just -- it would seem to me that  
4 then the Hermes is an integral part of the fuel  
5 qualification methodology. Or if you accept the  
6 methodology without explicit reference to Hermes or a  
7 follow-on power reactor, then your limitations and  
8 conditions are subject to demonstration of integral  
9 fuel performance in Hermes. You see where I'm going  
10 logically?

11 MEMBER SUNSERI: Like Dave, yeah. This is  
12 -- it kind of sets a precedent. I think what Kairos  
13 is doing, personally, one person's opinion, I missed  
14 the subcommittee meeting, it's laudatory that they're  
15 building a prototype.

16 MR. VAN WERT: Right.

17 MEMBER SUNSERI: And they can test out  
18 things like quality issues of taking a novel coolant  
19 and mixing it with the pebble TRISO fuel technology.

20 MEMBER KIRCHNER: Yeah. Well, we'll let  
21 you go. And when you get to the conclusion, this  
22 somehow seems like that should be explicit in the SE,  
23 that this Hermes, in effect, is the fuel quality --

24 MEMBER PETTI: Is a part of it.

25 MEMBER KIRCHNER: Is a part of it, yeah.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

1                   MEMBER PETTI: No, I think that would  
2 help. It's a context issue, really. Think about  
3 reading these things four years from now or something,  
4 you know, when you've lost all of it. That's the  
5 concern that I have.

6                   MEMBER KIRCHNER: Yeah.

7                   MR. VAN WERT: I do want to hesitate some  
8 because, you know, I don't want to put words in  
9 Kairos' mouth as well as far as their business plans.  
10 As you heard this morning, they were saying that it's  
11 also possible they decided that, you know, Hermes  
12 costs too much, licensing is too difficult, or  
13 whatever. And so if they decide not to do that, you  
14 know, that's a business decision on their part.

15                   And another applicant could come in, you  
16 know, or another method would have been if they were  
17 to run these simply in a laboratory setting, you know,  
18 patent or whatever, and not even do Hermes whatsoever.  
19 That's an option. That's their decision.

20                   I do want to say hats off to them for  
21 building a prototype. Because I do think that's the  
22 best test that they could do. So I don't want to say  
23 that they have to build the prototype. But I do think  
24 that if they do they're going to -- this is what  
25 they're going to be using to inform their future

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 decisions.

2 And I think with that in mind, what they,  
3 you know, our determination was that what they have  
4 supplied is sufficient for its purpose, for building  
5 Hermes and for doing the testing there.

6 MR. TOMPKINS: Yeah. And if I could just  
7 add, we have no plans to not do Hermes. I don't want  
8 to kind of give a --

9 (Laughter.)

10 MR. TOMPKINS: But, you know, things  
11 change, right.

12 MR. VAN WERT: Yeah. There is no  
13 requirement as staff limitations that they must build  
14 it, just to be clear. Any other questions on this  
15 before we go to the next slide?

16 All right, next slide, this is approaching  
17 the end. Again, we're just mentioning here that in  
18 addition to the, you know, what Kairos calls  
19 limitations within their topical report, we have the  
20 one single additional staff limitation which is that  
21 future license applications for non-power, read  
22 Hermes, will include justification for the  
23 applicability of this methodology during rapid reactor  
24 transient events.

25 And then the next slide is conclusions.

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 Simply that, in conclusion, as discussed in the  
2 previous slides and presented in the staff's safety  
3 evaluation report, the staff reviewed the topical  
4 report and concludes that the fuel qualification  
5 methodology contained within is acceptable for  
6 supporting fuel qualification of the Kairos fuel  
7 pebbles in either a non-power or a power version of  
8 the KP-FHR.

9 And that is all. If there is any further  
10 questions, I'd be happy to answer them.

11 MEMBER PETTI: Okay, no other questions.

12 MEMBER BIER: Dave?

13 MEMBER PETTI: Yeah?

14 MEMBER BIER: Quick question which is  
15 probably for the Hermes folks, not for the staff, the  
16 Kairos folks, sorry. Is there any expectation for the  
17 timing of Hermes, assuming that things to ahead as  
18 currently planned? I probably read that someplace and  
19 have forgotten it.

20 MR. TOMPKINS: Yeah. I think it's in the  
21 2026 timeframe, something like that. To start up, you  
22 mean?

23 MEMBER BIER: Yeah, just when is the ACRS  
24 going to see information, you know, regarding detailed  
25 plans and that kind of stuff?

**NEAL R. GROSS**

COURT REPORTERS AND TRANSCRIBERS  
1716 14th STREET, N.W., SUITE 200  
WASHINGTON, D.C. 20009-4309

(202) 234-4433

[www.nealrgross.com](http://www.nealrgross.com)

1 MR. TOMPKINS: Well, ACRS is going to see  
2 the Hermes CP application in April, I believe.

3 MEMBER BIER: Perfect. Thank you.

4 MR. TOMPKINS: Okay.

5 MEMBER PETTI: Okay. I guess we'll open  
6 up for comments from the public. Identify yourself  
7 and state your comment.

8 Okay, not hearing any. Then I think --

9 CHAIR REMPE: Okay. So we --

10 MEMBER PETTI: Back to you.

11 CHAIR REMPE: Okay. We've been in session  
12 about an hour. And there was talk about a closed  
13 session. Do you want to do that? Because I don't  
14 think it'll last more than ten or 15 minutes before we  
15 take a break and read the letter, the draft letter in?

16 MEMBER PETTI: Do members want the closed  
17 session? No?

18 CHAIR REMPE: Oh, does anyone want the  
19 closed session to discuss this?

20 MEMBER BALLINGER: I sent stuff direct to  
21 Dave.

22 CHAIR REMPE: You don't want to see what  
23 they've got on their chart at all?

24 MEMBER KIRCHNER: Not at this point.

25 CHAIR REMPE: Okay.

1                   MEMBER BIER: Are there additional Kairos  
2 presentations that were planned for closed session or  
3 just Q&A.

4                   MR. TOMPKINS: No, no.

5                   MEMBER BIER: Okay, thank you.

6                   CHAIR REMPE: Because it's not in their  
7 submittal, and it's not in the SE, or maybe it's just  
8 not needed to discuss it.

9                   So if that's the case, then let's take a  
10 -- let's see, it's almost 9:40. Let's wait until  
11 about five until, and come back, and read in the  
12 letter. Does that sound okay? It's a little bit more  
13 than 15 minutes for people like Charlie who say I  
14 never give you enough of a break.

15                   So, okay, we're going to recess and come  
16 back in five minutes. Thank you.

17                   (Whereupon, the above-entitled matter went  
18 off the record at 9:37 a.m.)

19

# Kairos Power

## KP-FHR Fuel Qualification Methodology Topical Report

---

ACRS FULL COMMITTEE MEETING

NOVEMBER 30

2022

OPEN SESSION

# Fuel Qualification Scope/Applicability

---

- “Qualified fuel” is defined as fuel for which *reasonable assurance* exists that the fuel, fabricated in accordance with its specification, will perform as described in the safety analysis (NUREG-2246)
- Fuel qualification methodology is applicable to KP-FHRs
  - Test and power reactors
  - Qualification is subject to the methodology and limitations described in topical report
- Demonstration of qualification will be documented in safety analysis report documents as part of a licensing application under Part 50 or Part 52

# Fuel Qualification Methodology

---

- U.S. and International Experience
  - Foundation of TRISO fuel particle technology
- Kairos Fuel Pebble and Particle PIRT
  - The fuel element PIRT is used to identify high priority phenomena for investigation in the fuel qualification program
- Fuel Specification, Manufacturing, and Quality Control through Inspection
  - Fuel specification equivalent to the AGR program
  - Fuel Manufacturing Development Program (e.g. pebble pressed at pressures comparable to AGR compacts)
- Fuel Qualification Envelope
  - Operation is within the bounds of existing AGR TRISO particle qualification envelope
    - If not, an irradiation test is needed to expand the operational envelope
  - Large temperature margins exist between AGR data and the KP-FHR designs for both test and power reactor

# Fuel Qualification Methodology *(continued)*

---

- **Fuel Pebble Laboratory Qualification Testing**
  - Pebble laboratory testing program will ensure that pebbles protect the particles from physical damage and interaction with Flibe
  - Pebbles tested for compression, impact, wear, infiltration, buoyancy, and compatibility with air and Flibe
- **Fuel Irradiation Qualification Testing**
  - A method is included for future irradiation test of a statistically significant number of TRISO fuel particles at conditions beyond the bounds of existing AGR irradiation test data to support a wider operational envelope
- **Fuel Performance Model**
  - Physics based models in KP-BISON are a quantifiable representation of fuel knowledge used for core design and source term analysis
- **Fuel In-Service Surveillance Program**
  - Pebbles inspected multiple times for damage and burnup during lifetime
  - Cover gas and Flibe monitored for radioactivity
  - Destructive PIE for both the test and initial power KP-FHR

# Questions from the Subcommittee Meeting

---

- There were two questions from the Subcommittee Meeting that we would like to address in more detail
  - Presence of transition metals in the Flibe and their effect on the SiC layer
  - Pebble Irradiation Program

## Presence of Transition Metals in the Flibe

---

- Laboratory testing program described in the topical report will demonstrate that infiltration into the fuel region does not occur
- Flibe has to infiltrate to the fuel annulus to bring transition metal fluorides to TRISO
- It is not credible to have metallic transition metals to transport to TRISO because they are solids, which is different than AGR where metallic elements were liquids or gases
- Particle temperatures for KP-FHR fuel are well below AGR irradiation temperatures where Ni attack was observed (~500°C lower)
- Because of the low operating temperatures, any detrimental effects are expected to progress slowly
- TRISO failures would be observable by fission product monitoring in the gas and coolant spaces for the reactor and limited by the technical specification circulating activity limit

# Pebble Irradiation Testing for the Hermes Test Reactor

---

- The KP-FHR fuel qualification methodology ensures fuel meets the reasonable assurance criteria for qualification AND there is no safety concern due to the Flibe being an additional separate barrier to the release of radionuclides
- The AGR program extensively irradiation tested TRISO fuel particles that define the fuel qualification envelope for KP-FHRs
- Kairos Power is developing the pebble and particle manufacturing which ensures high quality fuel which is demonstrated through inspection to be in compliance with the fuel specification
- Defense-in-depth – TRISO fuel particles + Flibe coolant
  - Irradiation testing cited in subcommittee meeting for prior precedent fuel designs were all for HTGRs which have higher normal operating and accident temperatures
- Fuel in-service surveillance and monitoring activity in the cover gas and coolant during operations provides further assurance fuel does not present a challenge to public health and safety

## Pebble Irradiation Testing for the Test Reactor *(continued)*

---

- The Hermes test reactor will provide important confirmation of the technology to support the deployment of a Kairos Power commercial power reactor
  - Hermes is a full integral test of the Kairos fuel for a power reactor
- The licensing of test reactors is provided significant latitude in the Atomic Energy Act (AEA):
  - *“In issuing licenses under this subsection of the AEA , the Commission shall impose the minimum amount of such regulations to fulfill its obligations under the act.” (AEA Section 104b)*
  - *“The Commission is directed to impose only such minimum amount of regulation of the licensee as the Commission finds will permit the Commission to fulfill its obligations under this Act to promote the common defense and security and to protect the health and safety of the public and will permit the conduct of widespread and diverse research and development.” (AEA Section 104c)*
- The extensive TRISO particle irradiation testing performed under the DOE AGR program along with the Kairos Power laboratory qualification program of the fuel pebble design and the defense-in-depth provided by radionuclide retention in the Flibe coolant provides reasonable assurance of the protection of public health and safety consistent with the AEA

# **NRC Evaluation of KP-TR-011-P, “Fuel Qualification Methodology for the Kairos Power Fluoride Salt-Cooled High Temperature Reactor (KP-FHR)”, Rev. 2**

Chris Van Wert  
US Nuclear Regulatory Commission

*November 30, 2022*

---

---

# Introduction

- Kairos Power, LLC requested staff review and approval of KP-TR-011-P, Rev. 2, “Fuel Qualification Methodology for the Kairos Power Fluoride Salt-Cooled High Temperature Reactor (KP-FHR)”
- Provides a methodology by which the Kairos fuel pebble design will be qualified for use in either a KP-FHR non-power or KP-FHR power reactor
- The staff’s review focused on the overall qualification framework including:
  - Use of existing data
  - Surveillance
  - Unirradiated testing
  - Irradiation testing

---

# Regulatory Basis

Title 10 of the *Code of Federal Regulations* (10 CFR) Sections 50.34(a), 50.34(b), 50.43(e), and corresponding regulations for design certification applications, combined license applications and standard design approvals

10 CFR 100.11 “Determination of exclusion area, low population zone and population center distance”

Kairos PDC 10 – “Reactor design” which has been approved by the staff (KP-TR-003-NP-A)

KP-FHR PDC 16, “Containment Design” which has been approved by the staff (KP-TR-003-NP-A)

---

# Staff Evaluation

## Applicability of Existing Data

- KP-TR-011, Rev. 2 is applicable based on a comparison of the Kairos and AGR-2 particles as well as the operating conditions
- Use of existing carbon matrix property data is applicable for determining pebble testing conditions for fuel qualification

## Fuel Surveillance

- Surveillance of the cover-gas, non-destructive examinations, and planned destructive examinations are acceptable for monitoring fuel performance and detecting particle failure

---

# Staff Evaluation (cont.)

## Unirradiated Testing

- Planned tests include mechanical, tribology, buoyancy and salt infiltration, and material compatibility
- The planned unirradiated pebble testing is acceptable based on the conservative test conditions and plant operating conditions

## Irradiation Testing

- Fuel pebble irradiation in a gas environment
- Purge gas monitoring for fission gas
- Post Irradiation Examinations

---

# Coolant Salt Impurities

- The staff considered sources available for impurities which could attack the particles (e.g. Fe, Cr, Ni, etc.)
- The transport of significant impurities to the fuel particles is not feasible given the chemistry monitoring system, solubility limits in molten salt, cover gas monitoring system, and significantly lower temperatures as compared with AGR-5

---

# Staff Limitations

The staff's approval of KP-TR-011-P includes the following staff limitation in addition to the limitations provided by Kairos in Section 4.2 of the topical report:

*Future license applications for non-power KP-FHRs will include justification of the applicability of this methodology during rapid reactor transient events.*

---

# Conclusions

The staff reviewed the topical report KP-TR-011-P, Rev. 2 and concludes that the fuel qualification methodology contained within is acceptable for supporting fuel qualification of Kairos fuel pebbles in either non-power or power reactor versions of the KP-FHR.
